Moreover, during the past seven years, the trading conditions have been abnormal. European industries fell, like soldiers on their battlefields, before the onslaught of the munitions boards of their war departments. The Allied governments discouraged exportation while Germany's great world trade fell to zero. It was an opportunity which, taken at its flood, might have led to America's permanent supremacy in world trade. Yet, actually, we were slow in realizing the opportunity. We had no world trade organizations such as Germany and England have sustained for the last hundred years. We had no mercantile marine and certainly no world financial system of American banks that could properly look after our credit interests. Our mastery came to us unbidden. We did not "sell our markets." Instead, the European countries in wartime sent purchasing agents to America, and literally made a beaten track to our door through the impenetrable forest of America's ignorance of foreign trade.

It was only natural that the increased foreign business forced many American manufacturers to open up European agencies in the Allied capitals. In many conspicuous instances these agents have made good and there has been created a steady demand for American products that has not even been affected by the unfavorable rate of exchange. Our success should be permanent, for Europe has got a taste of the American-made product and goods "Made in America" have the same glamour for Europe as has the label, "Made in Paris," on the headgear of the feminine world. During the war the foreign consumer discovered our adding machines, our dictaphones, our vacuum cleaners, our washing-machines, our farm tractors, our safety razors, our lighting fixtures, our chewing gum, our seamless hosiery, our toasted tobacco and machine-made building products. American goods became synonymous with sensibly planned apparatus calculated to save time, labor and trouble.

We thus laid a foundation for an immense world trade in up-to-date products; not by the full exercise of our own initiative, but through the pressure of circumstances. Our greatness in foreign trade was thrust upon us. As the war proceeded, our standing, first as the great neutral nation, and then as the country that turned the tide of the war, inspired a confidence amounting to awe in the foreign buyer. Then, the American "doughboy" unconsciously preached the gospel of America's boundless enthusiasm and good will toward all peoples. The A. E. F. was the best "good will" sales campaign known to modern business. The European buyer came to look upon dealing with an American firm as an agreeable experience with the clean-cut business methods of a newer era.

Under the impetus of all this encouragement we began to construct a foreign trade machinery throughout the world that could handle the business which seems, even now, to be awaiting us. There is a whole section, nowadays, of London's central business section that has become Americanized. At the foot of Kingsway, where Fleet street melts into the Strand, we have built London's first "skyscraper," the Bush Terminal, to house hundreds of American agencies. Passing up Kingsway we see the great building for the Ingersoll Watch Company nearing completion. Farther along there is the new headquarters of the Kodak Company, Limited, which is the British firm handling the American camera patents. Then along Kingsway there are the British representatives of American typewriter concerns. There is no serious competition of a British-made machine. The American typewriter is infinitely better planned. Here in Kingsway there are the offices of our hosiery and cutlery firms. From Kingsway down Oxford street and the vicinity we meet an automobile section with innumerable American automobiles, motor trucks and tractors on display.

One notices the recent establishment of American banks in London or the development of old firms that once handled merely the banking of tourists. The American Express Company is overflowing its headquarters next to the Haymarket Theater. Then there are the huge offices of the Guaranty Trust Company and the National City Bank of New York. To facilitate the work of the American business man the Old Colony Club of America bought the historical Morley's Hotel at Trafalgar Square and then found it much too small, whereupon they set about to find larger headquarters. In the Trafalgar Buildings a large American insurance firm is installed and also the English-Speaking Union which functions as an agency to promote understanding between England and America.

The same is true of Paris. Around the *Place d' Opera* we find a whole section that is rapidly becoming Americanized. In *Rue Scribe* we find the American Express Company altering its building to make room for its financial section. Near by we find the establishment of the Guaranty Trust Company, and Morgan, Harjies Company. The Standard Oil Company is opening headquarters in one wing of the *Hotel Crillon* facing the *Place de Concorde.* Down the *Rue de Rivoli* there are now numerous American export firms while the Old Colony Club is planning to take over the exclusive *Hotel du Rhin* in *Place Vendome,* to accommodate their members on foreign trade missions. Along the *Champs d' Elysées* one finds a number of newly-established agencies for American-made automobiles.

In Antwerp, now the base port for the American Army of Occupation, the American trader is establishing headquarters to develop our business with Holland, Belgium, and eventually Germany. In Switzerland, Zurich is developing as an American trade center and one sees all over Switzerland the erection of plants, such as the one of the Portland Cement Company, for the laboring conditions of Switzerland with the high quality of technical labor and the marked absence of unrest, seem most favorable for the investment of American capital.

The erection of this machinery for American trade has already shown results in the figures now available of our export trade for 1920. However, for the amount of effort expended the judgment should be "prosperity" rather than "complete success." We have sold $3,000,000,000 worth of American-made goods in Europe during 1920 as compared to $2,500,000,000 in 1919 and the total of manufactures of all kinds including the group known to the statistician as "manufactures for further use in manufacturing" will reach the $4,000,000,000 mark.

"American pep," just as much as American products or money, should be held responsible for our success on the other side of the Atlantic. Men and women from American cities and small towns cannot help but carry with them the restless enthusiasm that has made America the land of big and successful business. Our hurry and "snap" are as interesting and as contagious as the lure of our chewing gum which the "doughboys" introduced and Europe learned to like.

So much for the "good will"—and the start we have made in making "made in America" goods the most popular in Europe.

If we are to keep our mastery, however, we must begin carefully to study the situation. For instance, our war-time experience, when we apparently laid the foundations of our future world trade organization, has not been particularly fortunate. Things came too easily. In the short time that we have seriously carried on foreign trade, our salesmen have too often sat in their offices, turning away purchasers. While most of our manufacturers were careful of their European markets, there have been glaring instances of bad mistakes, manufacturers have got into the habit of sending goods designed for American consumption, rather than articles that would ordinarily meet the needs of the European. In France, for instance, there was one firm that sold automobile tires only fitted to an American type of rim. If the Frenchman bought the American tire, which he was forced to do because of the scarcity of French tires, he was compelled to change his tire rim as well. It is interesting to note that one large American tire firm has turned down the suggestion of the sales representative in France that they manufacture a tire for French consumption which is fitted to the French rim. Their answer to his suggestion was, "Preach the gospel of using the American rim." This expensive "gospel" has lost the concern its grip on French trade.

The same is true with a certain brand of shoes, for both the Englishman and the French look with distaste at the American box toe. One American manufacturer of men's clothing still blames his English representative for his failure to sell American-cut clothing with their un-British padded shoulders. Then there is the story of an excellent make of typewriter that neglected to change the dollar mark either to the pound or the franc mark and explained that their salesmen could argue their customers into spelling the word out more easily than they could manufacture a special key for their export machines.

These are little things, but they hurt. Even more important, and more harmful, is the fact that frequently the American manufacturer demands cash before delivery. This was a correct procedure when our supply was scarce and the markets clamoring, but nowadays, the English and the French trader cut under those American firms that have not altered their cash policy

(*Concluded on page 15*)

"Cutting Up Old Circus Money"

Concluded from page 6

"When the afternoon show was well under way, one of the rowdies—a big fellow—got up off of the seats, and walked into the ring. Two or three of his friends followed him, among them this son of the prominent citizen They sat down on the ring bank, with their feet hanging over into the ring track, so the horses couldn't gallop or work.

"We let them alone for a while, and when we finished all of the performance that we could without requiring the ring track, there was nothing else to do, except to put in some horse acts. The first horses we put into the ring the rowdies kicked at as they ran around, until they stopped running. Several times we asked them to get out, and to sit on the seats, but they paid no attention to anybody—just sat still and talked to themselves as though there wasn't a soul within a thousand miles of them. We had to do all the talking to them, because the audience knew they were ruffians, and wouldn't have a thing to do with them.

"Finally, I picked out two of my best men, and told them to go and ask these fellows to get back on the seats where they belonged. They made some insulting remarks to my men. About this time, when it looked as though the performance would be broken up by a fight, the father of this boy got up from where he had been sitting with his wife, and came over to see if he couldn't prevail on his son to behave himself. Before he got within two feet of the boy he pulled a pistol and shot his father dead. The performance was finished after that, but it wasn't a lively one.

"But that boy suffered for what he did," the "Governor" concluded. "We showed that town nearly every year after that, and the family home was close enough to our show lot that he could hear everything that went on in the tents—the music and the noise of the performance. And every time I passed the house, he was hanging over the front gate, crying.

"However, the most famous circus fight in history was our Jacksonville row," the "Governor" went on after a pause. "The day we showed there it was raw and cold and nasty. It seemed as though all our worst fights came on just such days—probably because everybody drank more when the weather was bad.

"We commenced to have a world of trouble with the rough element before we had the last wagon on the lot—we were traveling by rail then—because they all were drunk, and hunting a fight. When the afternoon show was started, three or four ruffians came over and sat in the ring, so that the only part of the performance we could give was there we had no use for the horses.

"Finally, we used up all our trapeze and other acts, and wanted to bring in the horses. We did bring them in. The rowdies persisted in interfering with them, and finally two of my men went into the ring, took the rowdies by their throats and their shoulders, walked them out of the ring, and pushed them down on the lower tier of seats.

"Well, the performance went on, and these fellows commenced talking it over among themselves. One of them allowed that De Vere had choked him. Then there were many in the audience who sided against us. They wanted to kill the circus man for hurting one of their citizens. Of course, it was only a little while before things began to warm up, but we managed to get the performance finished, and the crowd went up town.

"The place didn't have over a hundred buildings in it, and two-thirds of them were bar rooms. When the rowdies got up town they commenced to drink. They soon had a crowd around them, and everybody began to drink. Finally, they concluded that they wanted to arrest De Vere, and they got out a warrant for him. They didn't know his name, but that didn't make any difference.

"Then they came down to the cars hunting for De Vere. We took them all through the sleepers, and showed them he wasn't there. But they made a pretty good search for him, even to the extent of tearing out the berths. Of course, he wasn't there. We knew what it meant that afternoon, and we hid him out in the woods—stuck him down in a lot of brush, and told him to stay there until we came for him.

"We were to show there that night, but after these fellows went up town the second time they began to drink so hard, and raised the devil so thoroughly, that my brother Gil came to my private car.

"'Jack,' he said, 'I don't think we'd better show here tonight. I think the best we can do is to pack up and get out.'

"Finally, I concluded we had better get out. Everything was packed and the wagons were down at the railroad, and the train was pretty well loaded, when four or five of these fellows came to the train.

"They yelled and whooped until they had a big crowd together. They kept calling for 'that big fellow —' De Vere, you know—and Gil kept telling them he wasn't any place around.

"'Why, you big skunks,' they taunted us, 'we'll clean you out. You won't fight.'

"And they tormented my men so that they were on the point of leaving the show where it was if we didn't let them put a stop to the abuse. Gil came up to my car again.

"'Jack,' he said, 'it's pretty rough down there. I don't believe we can stand it much longer.'

"'Well,' I told him, 'you mustn't have any row down at the cars. Don't have any row. But if you do get into it, take care of yourselves.'

"When Gil got back to where they were loading, some fellow put a pistol to the head of a workingman whose name was Jim Robinson. Jim jerked his head away, and the pistol went off, but the powder only burned his face. The bullet didn't strike him.

"That started things. Guns commenced to pop, and knives to flash. The smoke from the pistols indicated a pretty good battle was going on. Of course, like all circus rows, it wasn't very many minutes before the rowdies were down and out, and getting the worst of it all around, because in those days we were prepared for a fight at any time. One or two of the rowdies were badly hurt. In fact, they didn't live long after the fight.

"The railroad ran through the center of the town, down the main street, and there were stores on each side. The rowdies made a hasty retreat into one of them, and our fellows followed them. They were so close behind that the rowdies hardly had time to get the door closed and the solid window shutters closed when my men got up on the porch in front of the store. They received a volley out of the windows, but fortunately nobody was killed.

"There happened to be two or three stanchions lying loose and close by the porch. Our fellows got them and battered the door down. When the door fell the mob went out the back way. Our fellows kept after them, and they went right into the next store, through the back door and windows, and through the store into the street, with my men right behind them. They chased the rowdies through nearly all the stores in town, and then came down the street to the corner to where I stood. It looked to me then that they had done enough, and I called the men off. They started back to loading the show on the train.

"I didn't think there was a soul left around any place, but all at once, when one of my canvasmen was walking along the side of a car somebody ran up behind him, and stuck a big knife in his back.

"Well, Gil happened to see the fellow with the knife, and he took a shot at him. He was at the head of our crowd, down near some cotton bales on the platform of the depot, and just as he shot somebody yelled to him to look out, and he turned around. A fellow ran out of a store with a shotgun in his hands, and took aim at Gil. He jumped behind a cage, and just as he did the gun went off. I suppose a dozen to twenty buckshot went through that cage, which happened to have a hartebeest in it. It didn't live long after that, and when it died we cut it open. There were six big buckshot in him.

"We began to load the horses down at the end of the train away from where the first fighting took place, when along came a lot more rowdies. They stood back in the dark, and commenced shooting at my men as they were loading the horses. They hit one of my men, but didn't kill him. But that intimidated my men, so that it was all that I could do to keep them at work, and to get the show loaded.

"After a while things got so serious that something had to be done, so one of my assistant bosses went up to the oil wagon, and got three or four buckets of coal oil. He carried them into the square in front of the stores while the mob was shooting at us half a square up the street. The boss yelled to the crowd that if another shot was fired, or he heard anybody make another threat, he was going to saturate the store in front of him, and, in fact, the whole town, and set fire to it. To make his threat good, he threw the oil on the roof of the store. That settled things there, and a little after dark we got loaded, and got away, as we thought, without any further trouble to be expected.

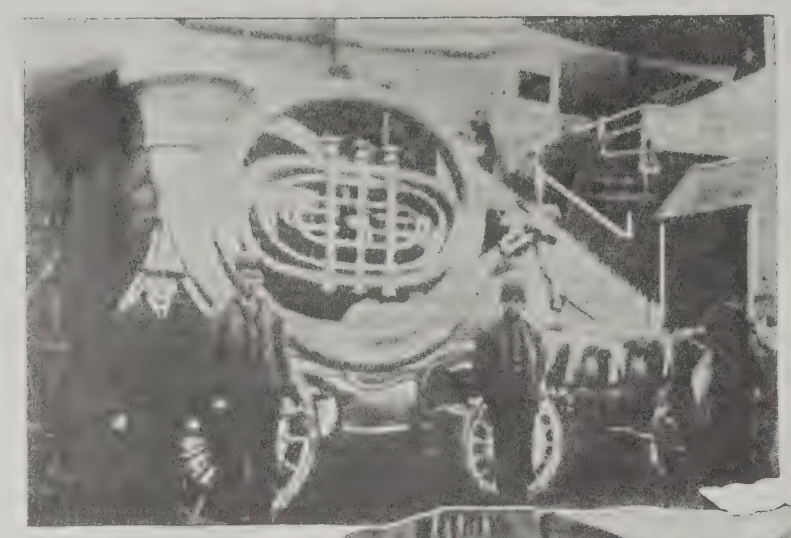
"But it only had begun. About a mile and a half out of the town there was a trestle that we had to go over. Some of the rowdies slipped out there and commenced to saw it in two, while a lot of others hid themselves in the bushes along the railroad. They shot into our train as we went along, but everybody was well protected, except one canvasman, who let his foot hang over the edge of a wagon. He got his big toe shot off. The fellow who did that must have taken good aim.

"When we got to the trestle it held together while our trains went over it, but the next train, which happened to be a freight, was wrecked.

"Some little distance down the road there was a junction and the rowdies had telegraphed down there to stop the show train, or to telegraph to Houston to arrest the whole show; that warrants were on the way. The telegraph operator there was friendly to us, and he didn't repeat the message. So, we went through without a hitch.

"That was a sort of a surprise to the rowdies, because we were billed for Houston, and they thought we were going to stop there, but we were routed to Galveston first. Then we were to come back to Houston, and go up through the state. By the time they discovered their mistake we were in Galveston, where we were to show four days, Friday, Saturday, Monday and Tuesday.

"We didn't go into the state again for years. Then a party of Texas lawyers and newspapermen made a tour of the North. They intended to visit Cincinnati, but nobody seemed to pay much attention to their visit.



"'Gil,' I said to my brother one day shortly before the party was due to arrive, 'here's how we can help ourselves in Texas. Let's get the mayor, and a bunch of our friends and entertain these Texas fellows right.'

"And we did it. When the delegation arrived we took them to one of the big hotels, and had a spread for them. The mayor welcomed them, and there was a lot of speechmaking. Incidentally, one of the speakers said that Cincinnati was the home of the Robinson circus, and of our family. One of the Texas lawyers got up, and made a great speech.

"'If ever the Robinson circus comes to Texas,' he wound up, 'they can own the state.'

"'Now's our chance,' I whispered to Gil.

"We got that lawyer off to one side, and told him the circumstances. He said he would fix it up all right, and he did as soon as he got back home."

Top—The giant calliope. Center—Driving stakes, always an interesting part of show day to town people. Bottom—A Robinson circus den.

This is one of several stories by Barnet, on early circus life. The next will appear in an early issue.

English Taught in New Mexico

A Story of Our Native Spanish-American

Above—A rural schoolhouse in the Rio Grande Valley, New Mexico. Below—A schoolhouse in the Sandia Mountains, New Mexico. Note the wild and rugged country surrounding it.

Above—This is one of the Bernalillo County high school buses that carries students to and from their homes out in the country. At left—A rural New Mexican school teacher and two of her pupils.

By H. W. PATTON

"I WILL speak English."

Supposing you are a schoolboy or girl and every time, during school hours, you uttered a word in the language of your fathers and your forefathers, which also is your common language, you are compelled to write the foregoing sentence 500 times as a penalty, would it cure you?

That is what the schoolboys and girls of New Mexico have to do if teacher overhears them speak a word in Spanish during school hours. If you do not think writing this short sentence 500 times is a task, try it! It means 8,500 strokes of a pen or pencil, and no boy or girl could do it in one session "after school," so the penalty is spread out, and the lesson is therefore all the more valuable to the "culprit."

At least 60 per cent of the people of New Mexico speak the Spanish language—some say they form 80 per cent of the population. These people resent being called Mexicans. They say they are Spanish-Americans, but Spanish is the language of their homes, and, of course, their children, of which they have many, speak Spanish with them. The youngsters speak Spanish among themselves outside of school hours, so it is difficult for them to stick to English during school hours, especially on the playgrounds at recess. However, with thoughts of writing "I will speak English" 500 times before them, they try to be careful. One hears much better English among the Spanish-American children of the cities and towns than among those in the rural districts. In the towns they mingle with real Americans, and naturally learn to talk English well. The children of the rural districts speak it in a much slower and studied manner.

The language question is one of the biggest problems the public school authorities of the newest state in the Union are facing, for it is realized that to become real Americans the people must speak the language of Americans. In the mountain districts adults are attending night school to learn English, but elsewhere efforts are being concentrated on children. Of course, the school children in the mountain districts are compelled to learn English and speak it during school hours, the same as the children in other districts.

New Mexico is rich in resources, and education is needed to develop these resources. Therefore the school system of the state is one of the best in the West.

Every facility is offered for boys and girls to attend school; in fact, they have to do it until they are 16 years old.

One often reads how great men of today walked miles to country schools in their boyhood. They tramped through rain and snow to obtain the rudiments of an education, but these little Spanish-Americans of New Mexico don't have any such hardships. In the first place, it rains very little in the state, and snow, except in the mountain districts, is rare. But even with almost ideal weather conditions these boys and girls in the rural districts of the Rio Grande Valley don't walk. Every school district has buses to take the children to school and bring them home again.

True, the country buses are not elaborate affairs, but they are comfortable. The counties provide the buses and let the job of transporting the children out on contract, the man landing the contract providing the horses and their sustenance. Each contractor gets from $40 to $50 a month for this service, but he makes only two trips a day, which gives him considerable time around his ranch. It also is provided in the contracts that if there is anything the children ought to see in the cities or towns, the contractors must drive them in.

Bernalillo County has a fine high school in Albuquerque, and students from many sections of the county attend, as well as hundreds from the city. The students from the rural districts don't have to worry about getting to school and home again, for the county has provided motor buses for their transportation, and this is free, too.

There are some beautiful little schoolhouses in the Rio Grande Valley, the architecture of the fronts of many giving a strong hint of old Spain. The schoolhouses in the mountain districts are not so attractive, but they are comfortable. Every school has its playground, and a great number of them have basket ball courts, this game being a favorite among Spanish-Americans.

For four months I lived close to one of the rural schools in the valley, and watched the children at their studies and at their play. They seem apt pupils and eager to learn. The school yards are always dusty, but this never bothers the boys, for almost without exception they wear overalls. I learned something about the little girls. After they are well away from school and out of hearing of teacher they are not a bit backward about approaching a stranger, with this request:

"Da me una niquelle?"

Spanish is not one of my accomplishments, so I said to the first one, a girl of eight or nine:

"No savvy."

When she discovered that I spoke English, she said:

"Give me a nickel to buy candy."

After that, whenever any of the children said "Da me una niquelle" I knew what was meant. It was peculiar that none ever asked for so small a coin as a penny.

The teachers in the schools in the valley have it comparatively easy compared to those in the mountain districts. In the valley the schools are all graded, the number of pupils determining the number of teachers. In the mountains there is only one teacher to each school. There are 15 such schools in the Sandia Mountains in Bernalillo County, and the majority of the teachers undergo genuine hardships, said Miss Irene Burke, county superintendent of schools.

"Some of the districts over there in the mountains become snowbound," said Miss Burke, "and the teachers are sometimes isolated for weeks, even months. Even when the snow leaves, the roads are very often impassable because of mud, so they are compelled to stay right in their little communities.

"There are a couple of American settlements in the mountains, and the teachers in those districts fare a little better. The others are all Spanish-American settlements, and the teachers have to live with these people, only getting out for a look at real civilization occasionally. The teachers in such districts usually rent a room in a humble Spanish-American home and do their own cooking."

The only way of reaching the mountain schools is by motor car or wagon, and to reach some of them, one must travel away around the north of the mountains and down the other side.

Three of the schools in the valley have running water, and one has its own power plant. Domestic science, with electrical equipment, has been introduced in three of these rural schools, and the Spanish-American girls are taking to it in great shape. Many of them were good cooks before the schools began teaching domestic science.

The county employs a school nurse, whose duty it is to visit both the valley and mountain schools. She examines the pupils for affected tonsils and adenoids. If the parents of afflicted children are too poor to pay to have the trouble removed, there are always volunteer physicians to perform the service. Vaccination, which is compulsory, is free, too.

While I was in Miss Burke's office, a gray-haired Spanish-American came in and overheard some of the conversation.

"Yes, it's nothing like the old days," he said. "When I went to school out here each boy was required to bring a few sticks of wood to school every day to keep the fire going. We didn't have a bus to take us home, either."

Does this educational work among a foreign-speaking population pay?

Any New Mexican, whether he is a native-born American or a Spanish-American, is emphatic in his reply in the affirmative. It is pointed out that the state is making great forward strides. Attention also is called to the unusually large number of Spanish-Americans from this state who enlisted in the World War. One also is referred to the number of Spanish-Americans who volunteered for service on the border and in old Mexico following the Villa raid on Columbus, New Mexico, in 1916. Those occasions were real tests of what education in Americanism is doing, the average New Mexican says.

Actors' Lot Improved, But Struggle Continues

Equity Association Has Done Much to Aid Profession

By HENRY ADAMS

ONE of the most significant conflicts ever waged against systematic oppression and for the preservation of the principle of manhood and womanhood of a profession numbering thousands of refined and cultured individuals, has been that between the actors and the men controlling the American theater. It culminated in the now historic actors' strike declared by the Actors' Equity Association in the summer of 1919. That there are still at work forces which would undermine the organization has been made apparent recently for the first time in the annals of the stage.

The strike welded the rank and file of the professional players into a solid phalanx. Men and women banded under the A. E. A. desperately resolved to emancipate themselves from the intolerable injustice to which they had been subjected. It was not a fight for higher wages. Young and old, veterans and novices of the realm of the footlights, combined to shake off the shackles of Jewish despotism—and won!

It was more than a strike. It was a revolution—a fight for liberty, the climax of decades of injustice and seven years of negotiations and diplomatic *pour parlers,* with the actors on one side, and on the other the same shrewd, grasping group of Jewish managers that had broken the resistance of their Gentile rivals, the old-time managers who clung to legitimate standards and were in the producing field for the love of good acting and artistic drama. With their forced retirement the actors lost their staunchest champions and best friends.

With the advent of the Jewish managers and their control of the American stage, about 1885-86, the actor's life and career took a new turn. There had been an air of romance over the mystery of the stage, and amid that mysterious atmosphere flourished the art of the actor. It was the period of Edwin Booth, E. L. Davenport, Lawrence Barrett, W. E. Sheridan, John E. Owens, Frank Mayo, W. J. Florence, R. D. McLean, Louis James, John T. Raymond, Madame Janauschek, Mrs. D. P. Bowers, Marie Wainwright, Marie Prescott, Lotta and Minnie Maddern (Mrs. Fiske).

Profession Is "Systematized"

WITH the dominance of the Theatrical Trust the time-clock system was introduced. To employ a favorite term of the trust, the profession was "systematized" and "put on a business basis," and individuality and artistic ambition were muzzled and chained.

The trouble was this: The trust reduced its overhead charges to an exact business calculation but refused to apply its principles beyond the curtain line. It wanted all the concessions that constituted the unwritten law between the actors and the old-time managers, who had shared their joys and sorrows in a truly fraternal spirit—insisting on a monopoly of all the benefits while imposing its own factory regulations, counting room methods and centralized control on a highly temperamental, idealistic class of artists, whose professional success was fundamentally grounded on happy abstraction and ignorance of the philosophy of profit and loss.

By 1910 the stage had got into such condition that the manager could make an actor or actress sign a contract which kept them on his reserved list for a matter of three or four months without pay and then discharge them without recourse.

Of course, the courts were open to the injured parties. But resort to the courts was the rarest of occurrence because it meant being black-listed.

They could be rehearsed daily for from four to six weeks in preparation for a new production and discharged at the end of that time without a word of explanation or apology, and, of course, without a cent of pay.

They were expected, and in fact, compelled to play the week before Christmas for half the amount of their stipulated salaries because, traditionally, the week before Christmas is the saddest of the year from a box-office point of view; but though holiday week, the week between Christmas and New Year's, is the most profitable to the manager of any week in the year, the actor's pay was not correspondingly increased. He was forced to share the manager's losses without a claim or his increased profits.

One of the most shameless conditions imposed upon him—one that proved a particular hardship to the female members of the profession—was the expense incurred for "dressing a part." In some plays a woman is expected to wear two or three changes of gowns, running up into a total of hundreds of dollars. If the play failed the company was disbanded and the loss fell upon the actress. At best she could claim only two weeks' salary.

Leading Figures Aid Greatly

A FINAL great offense against the children of the stage was a provision in the contract which relieved the management of all obligations to pay return fares. In nine cases out of ten notice to close simply meant that the tour was conducted at a loss; some unhappy town was burdened with a lot of stranded actors, and some fairly decent women had to sell themselves, in extreme cases, to procure the wherewithal to pay return railroad fares.

To the everlasting credit of the profession it must be stated that these steps were taken by men least affected by the conditions complained of. The corrective measures were taken by those who had much to lose and nothing, practically, to gain; and it was the purity of their motives, the wholly unselfish spirit manifested by them, that insured the success of the movement.

On Sunday evening, December 22, 1912, a meeting of actors was held at 133 West Forty-fifth street, New York City. The purpose had been to assemble a general committee of one hundred to discuss "the present unjust conditions of the actor's profession." About eighty persons were present. After several hours of general discussion a committee was appointed to develop plans. This committee consisted of Messrs. Albert Bruning, Frank Gillmore, Charles D. Coburn, William Harcourt and Milton Sills.

These gentlemen held several meetings, and on February 7, 1913, reported that they found themselves confronted by work of such momentous importance and extensive scope that they had been impelled to draw others of their brother-actors into their conferences and deliberations, and the committee was augmented by the addition of seventeen others, including Francis Wilson, Grant Stewart, Cyril Scott, Bruce McRae, Richard Bennett, Robert Edeson and Wilton Lackaye.

The committee emphasized its simple demand for justice. "Our movement is in no sense a crusade; what we seek is a re-establishment of the best form of contract previously prevailing under the best managers: a renaissance, not a revolution. It is an endeavor to uphold and advance the dignity of our calling."

The movement had fortunately got into the hands of seriously minded men with a love of decency, cleanliness and fair play, who did not wish to shirk their task. The committee held thirty meetings and with the aid of legal counsel had drafted a tentative form of contract as well as a constitution and by-laws, and at the same time submitted at a general meeting on May 26, 1913, a carefully chosen list of men who had consented to serve as councilmen and officers. The latter consisted of Francis Wilson, president; Henry Miller, vice president; Bruce McRae and Howard Kyle, secretaries, and Richard A. Purdy, treasurer.

This was the birth and genesis of the Actors' Equity Association.

Gentiles to the Fore

HENRY MILLER retired after a brief affiliation with the organization, as he is a manager as well as an actor (the office of vice president being at present filled by Miss Ethel Barrymore), and Mr. Kyle retired from the position of secretary shortly before the strike, his place being taken by Mr. Grant Stewart, the responsible office of executive secretary going to Mr. Frank Gillmore. In addition to the regular officers, the council of 1915 consisted of Edwin Arden, George Arliss, Holbrook Blinn, Albert Bruning, Arthur Byron, Charles D. Coburn, Edward Connelly, John Cope, Frank Craven, William Courtleigh, Jefferson DeAngelis, Robert Edeson, Edward Ellis, Grant Mitchell, Milton Sills, Charles A. Stevenson, David Warfield, John Westley, Thomas Wise. General counsel, Paul N. Turner.

The names are specially mentioned here because on these largely devolved the burdens of carrying the organization through its trials and tribulations. Warfield retired after serving a short time and took an attitude antagonistic to the strike, and this practically eliminated the only Jew in the list of officers. (Two or three did serve on the council, but their attitude was negative.)

After two or three years of mutual sparring a splendid "get together" banquet was arranged at the Hotel Astor, at which conciliatory and diplomatic speeches were delivered.

The most ready response had come from the Gentile managers. A number of the latter recognized the equity of the actors' demands, and almost from the first worked in harmony with the organization, whereas the Shuberts and Alf Hayman led the opposition and persisted in issuing their own contracts. But by persistent pressure and negotiations a so-called standard, or "Equity," contract was finally agreed upon.

The strike of 1919 was brought about by a clear evasion of the terms of the standard contract and the arrogant refusal of the managers to meet representatives of the A. E. A. for a conference on the grievances growing out of these persistent evasions. The A. E. A. became an affiliated branch of the federation. The long and trying period of dickerings and irritating, fruitless efforts to reconcile constantly arising differences was at an end.

Mr. Frank Gillmore, executive secretary of the A. E. A., had vainly warned the Producing Managers' Association against the folly of disregarding the desire for a parley on a fresh accumulation of grievances growing out of infractions of contract (largely by the Shuberts), and with the final declination of the opposition to give the actors a hearing, the strike was declared.

Some slight internal frictions and jealousies led a few to desert; others had their artistic sensibilities wounded by the prospect of becoming affiliated with Labor, and a few others, who had turned managers themselves, were faced with the necessity of choosing between the actors and the managers, and cast their lot with the latter. But the official staff of the A. E. A. remained practically unimpaired, with Francis Wilson president; while thousands of actors who had formerly held aloof, half persuaded that an actors' organization would not endure through a storm, now flocked to the banners of the A. E. A. and helped enthusiastically to carry the fight to a successful issue. The organization had suddenly grown from between 700 and 800 members to 10,000 and more, and its contract was formally accepted by the managers for a second time.

Those who had conceived the bold project laid down the fundamental principles of organization, put it on its feet, ready to walk, and supplied the generalship for the strike, and the strategy for the conduct of the campaign were Gentiles almost without exception. In the end two or three Jewish actors reaped some notoriety from a spectacular manifesto of loyalty to the actors, but even more conspicuously, Jews like Louis Mann proclaimed their hostility to the A. E. A. as the leaders of the opposition in the ranks of the actors themselves.

The great fight for principle was won. With its increased revenues and the prestige of its success, the A. E. A. was able to expand and extend its benefits to the chorus girls, mercilessly exposed to every species of wrong and of tyranny.

Shuberts Still Recalcitrant

BUT it should not be assumed that the efforts to steal the fruits of its victory have relaxed. More than any others the Shuberts continue to be the greatest obstacle in the path of harmony, and though they are parties to the agreement reached as a result of the strike, *Equity,* the official organ of the A. E. A., in its February issue contains the text of formal charges filed with the Producing Managers' Association. The various counts in the bill of complaint are introduced in the following letter clipped from the issue of *Equity* of the current month:

January 13, 1921.

Producing Managers' Association,

Gentlemen: With regret we submit herewith definite charges of flagrant and continued violation of the basic agreement between us of September 6, 1919, by the Messrs. Lee & J. J. Shubert. These reveal, among other abuses, unfair discrimination, failure to give contracts, failure to pay according to contract, and discharge of actors who complain of such failure—all fundamental matters.

The settled policies of the Messrs. Shubert, clearly evidenced by these violations, are opposed to that of nine-tenths of your members, who live up to this agreement and with whom we have worked in harmony, and for this reason, and also because you are the guarantor of performance in good faith of each producing member, and therefore cannot countenance such a policy, we request, upon confirmation of these charges, that all relations between you and the Messrs. Shubert be severed.

Yours very truly,
Actors' Equity Association,
FRANK GILLMORE,
Executive Secretary.
Chorus Equity Association,
DOROTHY BRYANT,
Executive Secretary.

According to late reports, the Shuberts, when apprised of this action, decided to "talk things over" with a view to coming to some amicable understanding with this pestiferous Gentile association, which has done so much to rescue the theatrical profession from the degradation toward which it was heading under the Jewish monopoly of the stage and Jewish control of actors and actresses.

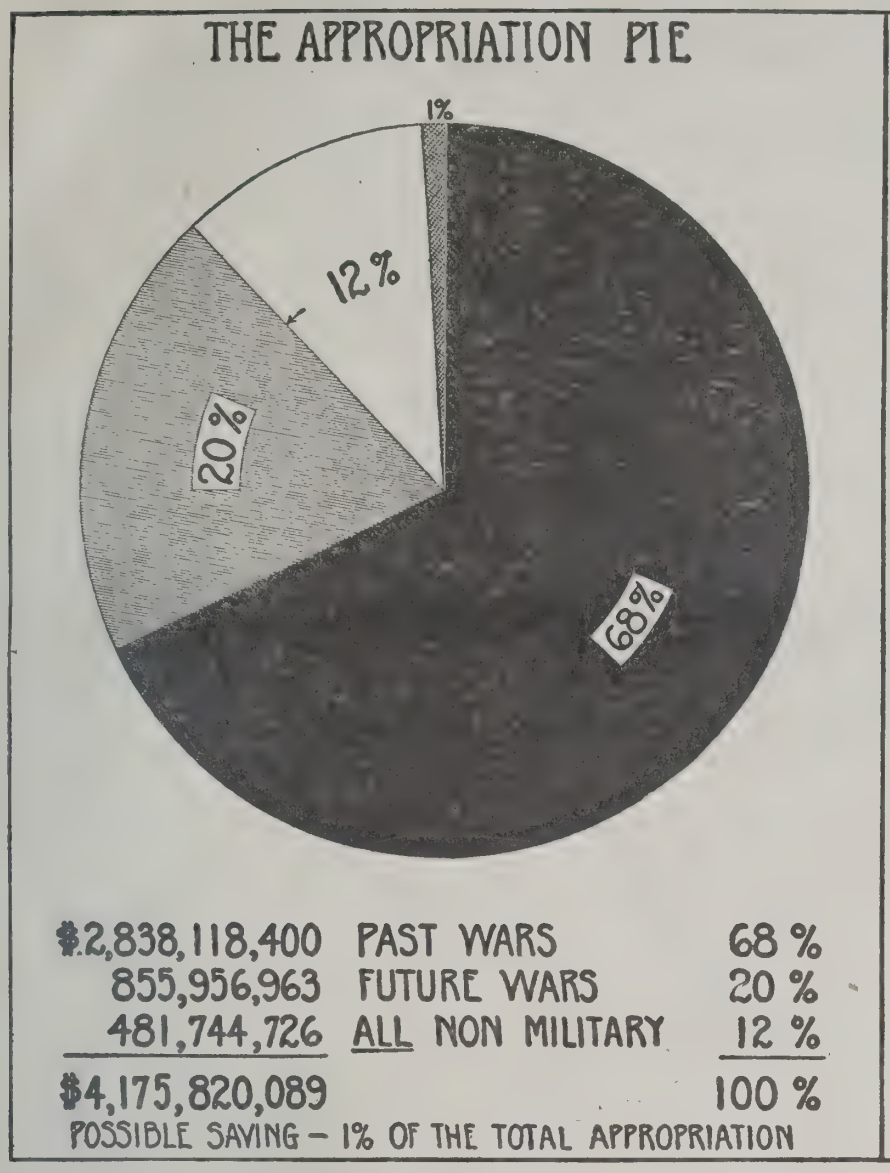
What the A. E. A. Has Done

THE influence of the A. E. A. can be clearly and briefly summarized after less than two years of power:

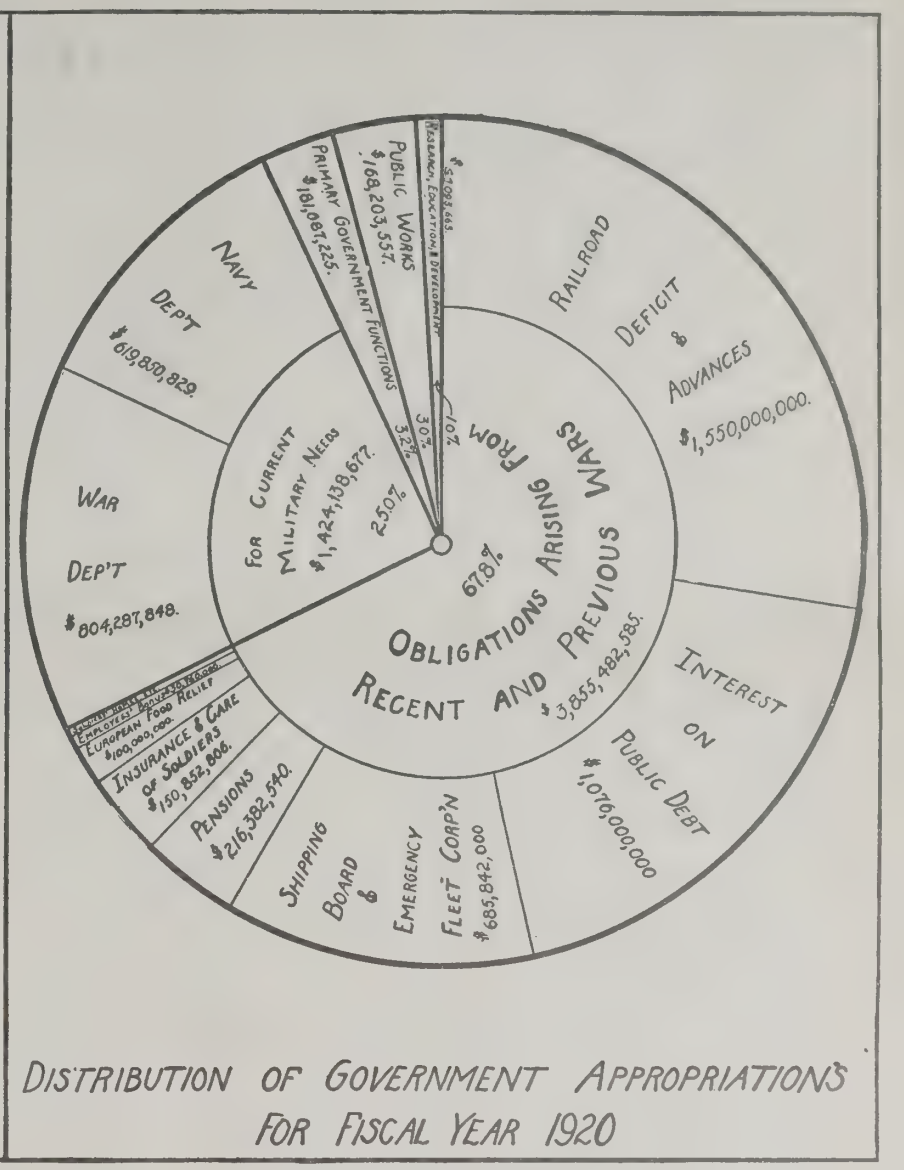
It is making the theatrical profession a cleaner profession than it could possibly be under previous conditions.

It is breaking the shackles which the Jewish theatrical brokers and speculators were riveting upon the wrists of actors and actresses.

It has cast a protecting arm around the weak and helpless.



It has put a new spirit of professional consciousness, pride and self-respect into the men and women of the stage.



Its vigilance is steadily tending to defeat the activities of the so-called shoe-string promoters of theatrical enterprises who are so largely responsible for the unsavory reputation that gained headway when women were left unprotected from unscrupulous managers, their temporary masters.

Its chief claim to universal respect and encouragement rests on the splendid foundation that its efforts rarely, if ever, are directed to the regulation of wages, but are specifically centered on moral problems, on elevating the character of the profession, by shielding it to the utmost of its power from contact with vicious exploiters.

"World Disarmament First!"—The Slogan

Concluded from page 7

DISTRIBUTION OF GOVERNMENT APPROPRIATIONS FOR FISCAL YEAR 1920

at the earliest possible moment for considering disarmament.

Keeping in mind the President's desire to maintain close co-operation with the legislative branch of the government, it may be that this "earliest possible moment" will synchronize with the meeting of the 67th Congress in special session. He may contemplate communicating his plans to Congress or be waiting an expression of Congressional opinion on the subject. He has full authority, however, to go straight ahead with an invitation to foreign nations to join the United States in such a conference and if he acts at once on the authority conveyed in the Hensley amendment to the naval appropriations bill of 1916, it is believed that the conference could be under way in less than two months. The whole question of disarmament practically narrows itself down to one of naval building programs, and this in turn distils into one of battleships. The battleship, perhaps more than any other object, seizes on the popular imagination as a symbol of modern warfare. This monstrous machine involving an initial cost of anywhere from twenty-five to forty million dollars to produce has a horribly formidable appearance and one calculated to strike terror to the heart of man. Sixteen such ships, including two airplane carriers at a cost of $28,000,000 each, are provided for in the three years' building program submitted by Secretary Daniels.

Last week, Senator Borah himself explained his proposal for a "naval holiday." The next article in this series will deal with the immediate repercussions caused by his resolution as brought out in the hearing before the House Naval Affairs Committee.

Won World Trade—Can We Hold It?

Concluded from page 11

by offering the foreign buyer the long-term credits to which he is accustomed.

But, above all, if we are to keep our place in the European market what we need at once is a well-organized system for gathering world trade information. England is reasserting herself in the markets of the world, not because of the superiority of her goods, but because of the superiority of her sources of information. She has recently organized a department of over-sea trade which prevents duplication by individual English firms in the gathering of information. Moreover, this department, which was created by the British Foreign Office and is considered a part of it, directs British trade so that there shall be no murderous competition between English firms in foreign markets. This trick they learned from the Germans by studying the methods of trade combinations of rival firms.

In contrast to the highly organized system for obtaining accurate trade information used by the British and French, stands the individual efforts of isolated American banking firms who are novices in world trade. The English business man has full use of the trade information gathered for him by the British Foreign Office. Then we find such combinations of English traders as the representation for British Manufacturers, Limited, that puts up a bold trading front to the world. Moreover, the diplomatic services of Great Britain and most European countries are functioning first, last and all the time, in the interest of the traders of their respective countries. Our diplomatic service, unorganized, without trade experts and men permanently assigned to make trade conditions their life work, functions as a splendid tourist agency, but rarely as the accurate business guide for the American trader. In recent years, several banking firms have organized foreign trade research departments, but they cannot be compared with the vast systems maintained by old-fashioned European houses.

In some quarters we hear a great deal of talk about the combinations of European firms to "drive the American out of world markets." One reads wild editorials denouncing the actions of our "ungrateful Allies" in "waging war" on our financial supremacy. We lack a certain appreciation of the task of trade reconstruction which confronts a European country in the restoration of her credit. It is all to the advantage of the European nations to sell to us, for as long as their gold streams over the Atlantic to pay for American goods their rate of exchange drops. If Europe is ever to reach normalcy, she must do it by paying her interest on war loans in manufactured products rather than with her depleted stocks of gold.

The question of these war debts is a very serious one to the European governments. England is the only European nation today that is seeing daylight on this question.

The figures of the war debt tell a very dramatic story. They are America's real mastery. The indebtedness of the various Allied countries is arrayed, as follows:

War Loans—Current Financial Chart.

Country	Am't Borr'd	Am't Repaid	Bal. Due
Great Britain—	$4,277,000,000.00	$ 80,181,641.56	$4,196,818,538.44
France—	2,987,477,800.00	31,449,357.55	2,956,028,448.45
Italy—	1,631,338,986.00	Not Reduced	1,631,338,986.00
Belgium—	349,214,467.89	10,000.00	349,204,467.89
Russia—	187,729,550.00	Not Reduced	187,729,550.00
Czecho-Slovakia—	60,524,041.10	Not Reduced	60,524,041.10
Serbia—	26,780,465.56	605,326.34	26,175,039.22
Rumania—	25,000,000.00	1,794,180.48	23,205,819.52
Greece—	10,000,000.00	500,000.00	9,500,000.00
Liberia—	26,000.00	Not Reduced	26,000.00

In addition, the United States Liquidation Commission sold our war supplies to Europe on credit extended to the amount of $140,104,021.84. Four hundred million dollars was realized through our agreement with France for the purchase of war material in a lump sum. We sold Poland stocks amounting to $60,000,000. In addition, Herbert Hoover is said to have received $80,000,000 in obligations for foodstuffs.

Certainly, 1921 merits our special prayers for the development of an established trade and financial policy of the United States toward the world. The Harding administration faces a real problem in developing a consistent trade policy, based on honorable principles of enlightened self-interest, which would not tarnish our reputation as a nation that cannot play false to the world. It is within our power to look upon Europe as inhabited by subject people. A consistent world trade policy would check the American exploiter of Europe's financial dilemma and would insist that we should never become party to political intrigues to gain advantages in trade. By holding aloof from the system of bribery and bullying, today the key to success in some markets, we may be able to establish a precedent for honor in world trade.

Our first need, then, if 1921 is to continue our European mastery, is to develop a world trade policy that shall embody the best traditions of our domestic business. The history of success in American business has been a history of honest dealing based on honorable competition. To carry this out in world trade we need a readjustment of our diplomatic service to give us accurate trade information so that we will not trade with the world in the dark. The function of this new diplomatic service is twofold; it must check the unscrupulous American who is out to trade unfairly with the world, and it must check the foreigner who would trade unfairly with us. For only by being true to the real American spirit in trade, a spirit inspired by friendly competition and mutual trust, can we best assert our mastery in the new era that must follow the present confusion of a Europe that is weary of overwhelming ambitions for world subjection.

John Burroughs Comes A-Calling

IN THE DOORWAY AT "SLABSIDES"

LATE one October afternoon John Burroughs walked into the editorial rooms of THE DEARBORN INDEPENDENT, laid his broad-brimmed hat upon the desk and sat down, his keen eyes beaming benignantly as he took in the various objects within sight.

"Where do you do your writing?" was one of his first questions.

It was a busy place and not always free of noise; certainly nothing like the peace of Slabsides where John Burroughs did much of his work.

"Oh, I would have to have it much quieter than this if I were to write," he said, but added that he did not have the advantage of being trained in a modern newspaper shop.

He still liked to write with a pencil and said he did most of his work that way. Forming the letters of each word gave him time to think, he said; a typewriter ran on so rapidly.

Mr. Burroughs had previously written a letter of friendly judgment upon THE DEARBORN INDEPENDENT, taking each article in its turn and giving his opinion of it, perfectly unaffected in his praise, perfectly frank in his analysis.

He was quite elated that day. After more than 80 years on this planet he had seen, only the day before, a species of bird of which he had often read and studied, but had never before met. It was a bird of the far North to whom a Michigan winter is as summer, and who had come South to summer among our snows. In a little clump of woods, while out walking, Mr. Burroughs had come on his first sight of the bird, and his almost boyish exclamations of delight were heard for days afterward. It was really an "event" in his life. Anyway, the newspaper men seemed to get that opinion, for the fact that John Burroughs, over 80 years old, had seen a certain bird for the first time in his life, was telegraphed over the United States.

Mr. Burroughs talked about many things. He was unfeignedly pleased to find that the men who were talking to him had read his "Wake Robin" when they were in school, in the old Riverside Series, and were holiday disciples of his on hill and river. As one of them said, "I have been wanting all my life to see John Burroughs, and here he comes walking in one afternoon and flings his hat on my desk."

The men he had met, he spoke of freely when questioned about them; perhaps more reverently of Emerson than any of them. The others were celebrities; Emerson was a great teacher. There was something almost like religious reserve when he spoke of Emerson as a man, and his works were as familiarly quoted as if they were Scripture, as to Burroughs perhaps they were.

Carlyle was also a "great fellow." What was he like? Well, he talked like a battle, and he laughed like a storm. He laughed with anger and with scorn, mostly with scorn; when he was pleased perhaps he laughed less. But he suffered much. His hands were large and soft—he had not forgotten the feel of Carlyle's hand. Rich Scotch speech, with the world all wrong and lightning-like glimpses of the truth it needed to set itself right: that was Carlyle.

One memorable story was told by John Burroughs that afternoon, which served to link three great names together and give one a sense of the nearness of all things, after all. Burroughs had gone over to England to visit the literary heroes of his youth. Carlyle was at that time endeavoring to convert an English intellectual to the philosophy of Goethe. And so the great Scotchman wrapped up a package of Goethe's manuscripts, tucked them under Burroughs' arm, and asked him to deliver them. It brought these men very near, to hear John Burroughs tell it all in the twilight of an October afternoon.

John Burroughs walked out of the office and across the fields to the house where he was a guest. He came but once more and then he pressed the button which started a new flour mill grinding wheat into flour. It was perhaps an act symbolic of his life.

Many people, since his passing, have recalled his lines:

"Serene I fold my hands and wait,
Nor care for wind, or tide, or sea:
I rave no more 'gainst time or fate,
For lo! my own shall come to me."

Wisconsin Plan to Keep Nation at Work

Wisconsin Plan to Keep the Nation at Work

"THE great question today is how to get workingmen to work, get their good will and get them satisfied and loyal. Consequently the problem is to try to establish that same security of jobs that capitalists have secured for investments. Business has become efficient for the investor, but remains inefficient for the worker."

John R. Commons, of the economics department of the University of Wisconsin, is not a Socialist. But he has definite ideas on labor questions and has written more books and compiled more volumes on labor history than any other single author. He has also served as president of the American Economics Association. Mr. Commons helped to draft the Wisconsin Workmen's Compensation Act and served on the industrial commission for a term in the administration of the law.

At his request, bills have been introduced in several legislatures, notably New York and Wisconsin, to present his viewpoint. Maybe they will not pass. But he worked years for workmen's compensation and legislation to prevent accidents before his dream was realized. His new plan will also come, he says. And he will wait!

"Time has demonstrated under present laws that accidents did not pay," continued Professor Commons, "and it will demonstrate that unemployment does not pay and that it can be stopped.

"We must know that we are not considering simply the interests of the workingman but also the interests of employers and of the state. We are considering that we are in the midst of a great struggle between capital and labor and that the part of legislation is to do what it can to mitigate that struggle."

Employment Insurance

WISCONSIN had workmen's compensation and accident laws put on the books ten years ago largely at the behest of Professor Commons. By them industry pays for accidents and the burden is shifted to the public. These laws are the basis of his unemployment plan. Substitute into the workmen's compensation law the word "unemployment" where the word "accidents" occurs and you will have a practical draft of the unemployment bill. It provides for unemployment compensation of $1.50 a day for thirteen weeks. The same commission which administers the workmen's compensation laws would administer the unemployment statute as an added duty. Professor Commons talks about what he hopes to accomplish by this legislation in a simple way. He says the same opposition developed to compensation laws, but results under the laws when enacted proved his theories.

"I can perfectly appreciate the attitude of employers who at the present time look upon this proposition of unemployment prevention in the same way they looked upon accident compensation," said Professor Commons. "They have not been acquainted with it. I have talked with employers and have found this, that a very large number of them are awake to the question of unemployment and not only that but they think something can be done.

"I was speaking to a meeting along this line three or four years ago and contended that employers could prevent unemployment if there was enough money in it. Mr. Redfield, Secretary of Commerce of the United States, who was on the program at that time, said that it could be accomplished and that he had done it in his own factory for the last thirty years. He is one of the big employers in the city of Brooklyn, New York, a firm in the machinery and metal trades, and since 1890 had not laid off any hands. They had great difficulty in avoiding it in the hard times from 1893-1897. They were skating on thin ice at that time, but notwithstanding, they succeeded. It is a very simple arrangement when you once put your business talent to figure it out. They simply tied up their sales department with their production department. Their salesmen were instructed not to take rush orders if the shop was already crowded, but to get their customers to spread out the work over the year and to get them to order early before the rush season came on.

Sales and Production

"I VISITED a year and a half ago, with some six of my graduate students, some thirty factories in the United States looking for the best practice in labor management. We found perhaps a half dozen firms that by a process of this kind had prevented unemployment. One of the great examples in the United States is the Dennison Tag Manufacturing Company. All of you know the shipping tags and tickets you get on the railroad. That company started out with a seasonal trade. They were manufacturers of Christmas cards. It used to be that no retailer would order Christmas cards until September or October and then the company would be crowded with work. They took on all the help they could get for two or three months and they laid them off as soon as Christmas came. The company then conceived the idea that both for the good of the plant in not having idle machinery and for the good will and loyalty of their workmen they should never lay off a man. So they tied up their sales and production departments.

"At the present time the Christmas cards that you will buy next Christmas have already begun to be manufactured. They have spread the manufacture out over the year because they put their business talent to figuring it out and their salesmen are instructed to take orders for delivery in such a way that the product can be manufactured throughout the year. Then they offer some discount for orders in advance. It is a matter of adjustment throughout the market.

"Then in addition to that they put in a number of side lines that would dovetail in at different seasons

DR. JOHN R. COMMONS

so that when they are not manufacturing one product they would be manufacturing another, and they trained their working force so that they could shift from one occupation to another. They set up an employment insurance fund by which they could carry themselves over a period of depression, just as a sound business corporation sets up a business reserve in order that it may continue to pay dividends during the period of depression. So they set up an unemployment reserve so that they can continue to pay wages during a period of depression, or to use it in stocking up goods instead of shutting down.

"I know of a number of firms that have this unemployment fund. They use it as a reserve to hire laborers and stock up during a period of depression, knowing that later on they can sell the goods. It means that you must begin two or three years in advance and build up your reserve while times are good and thus have a reserve not only for paying dividends but also for paying wages during a period of depression."

How It Works

THESE actual business demonstrations seemed convincing and he was asked why it was that employers generally did not follow this practice.

"Those with whom I have talked recognize its importance but they say it is impossible," Dr. Commons quickly replied. "They would say you cannot do it. The principal reason they cannot do it is because all of them do not do it together. A few of them may try to do this, try to spread out the work. Consequently these employers, a few of them, are at a disadvantage. These men who are not spreading out their work get all the orders. So competition prevents those who would like to stabilize employment from doing it.

"The reason why business men expand and why banks give them credit," explained Professor Commons, "is because when they have rush orders, like those of the last few years, they know that when the stoppage comes they can lay off all of their employes suddenly without notice. But under this system every man that the employer takes on adds a new liability. The employer does not escape his liability when he lays him off. He runs under the probability of being compelled to pay that man $9 a week for thirteen weeks.

"What happens now is something like this. The manufacturers in the state have rush orders. They get credit from the banks on future deliveries. Then they go out to look for labor. They pull laborers in from the farm and then after the job is finished they lay them off. One of my colleagues at the university spent last summer with a staff of people working for the Department of Agriculture at Washington. They interviewed some 200 migratory laborers and hoboes in the harvest fields of the wheat belt. They found that 60 per cent of them started in as farm laborers who were pulled into the city and then laid off and went back to the farm again, and then finally getting uncertain and unsettled they got the hobo habit. Sixty per cent of our hoboes are not foreign, but Americans who have been taken from the farm to the city and then thrown off without notice. This practice deprives the farmer of his laborers when he needs them most, then throws them back on him when he can do the least for them.

"So the proposition of an unemployment compensation law would consist in enlisting the aid of the banks and making the law universal.

"I know very well that no individual employer takes any satisfaction in laying off his men. But no individual can help himself. It is the system and the competition for profits that does it, and the fact that they do not all work together to prevent it. The same was true with accident prevention. It required accident compensation to get them all to work together to prevent accidents. To this one fact I attribute the bulk of the agitation of Socialism."

"What do you say to the charge that such a law would be paternalistic or socialistic?" He had anticipated the question.

"I claim that it is neither paternalistic nor socialistic, but capitalistic," came the reply. "In paternalism, if we followed the copy of England, we would have an entirely different proposition. England has had an unemployment insurance law for ten years. They started out insuring about 2,000,000 men in the building trades and now, since the war ended, they have increased the number to about 10,000,000. Under that law it is provided that the employer shall pay 40 per cent, the workingmen 40 per cent, and the state 20 per cent of the cost. Furthermore, that the state shall conduct the insurance business. Italy has copied England. But England waited too long to bring this about. They waited until four-fifths of their population were wage earners. We should not wait too long in this country.

Prevention, Not Relief

"WE HAVE only about one-third of our population as wage earners. We may wait like England and then adopt some plan to relieve the suffering of the workers. As I take it the idea in Wisconsin, as shown by our accident compensation law, is the prevention instead of the relief of unemployment.

"In the proposed measure for Wisconsin the employes are not asked to contribute anything, the employers carrying the whole burden through their insurance companies. It might seem that if the thing was unpreventable it would be proper for the workingman to contribute. But it is largely preventable and there is only one who is in a position to prevent it. The workingmen cannot prevent it, but the employer or business man and the banking system alone can prevent unemployment.

"Taking the manufacturing industries alone, you will notice that on an average 10 per cent are unemployed throughout the entire period. That means 10 per cent of fifty-two possible weeks, so that the average period of unemployment is about five weeks in the manufacturing industries of Massachusetts. In other words, the average man was unemployed five weeks and employed forty-seven weeks. Now it is during those weeks that they are employed that the employer builds up his insurance fund, and it is during those weeks of unemployment that he pays out his insurance fund. So you can figure out on the average about how much it will be.

"Assuming then that there was no unemployment prevention, assuming all of these averages for the manufacturing industries, we find that an insurance premium of about $1 a week for each employe would build up a fund of $45 for an average of five weeks at $9 a week. In other industries, like building trades, it may be larger. Suppose it runs from $2 to $4 a week for each employe while employed, according to the business of the employer. When it comes to making bargains for wages, $2 to $4 a week is not a very large item."

"Should both capital and labor contribute to a fund to prevent unemployment and will men work cheaper under such a system?" was suggested.

"It seems to me the employes should not contribute to the tax. Several years ago I looked up this matter in the city of Milwaukee and I found that carpenters in the building trades were getting 44 cents an hour for eight months' work. But the street railway company, which gave them steady work throughout the year, was paying them 26 cents an hour for the same kind of employment. Yet the men who were working at 26 cents an hour were making as much money in 12 months as those working in the building trades in eight months at 44 cents an hour. It certainly is a talking point with the employer to say that if I can give you steady work the year around you will make some reduction in your wages. I presume that the workers as well as the capitalist will see the point and that the workers will probably be willing to take less wages."

Not a State Function

THE measure drafted by Professor Commons applies to all corporations and to individuals who have three or more employes. The farming industry is exempted, because it is claimed the farmers cannot organize to prevent unemployment. No employment compensation shall be paid on account of strikes and lockouts.

The insurance for unemployment shall not be a state function. Employers themselves banded in mutual companies can best work this out. By the plan the various mutual insurance companies will organize themselves, as is already done in Wisconsin under the accident compensation law, into a bureau which shall determine the premiums and the rates so as to provide fair dealings among different ones.

"It seems to me that not only on the experience of what the individual employers can do, whom I have mentioned," concluded Dr. Commons, "but on the urgency of this great problem, on this miserable fluctuation and unbalancing of our civilization, we should consider whether or not it would not be better, instead of waiting until such time that the system becomes unworkable as it did in Europe, we should introduce such a measure as we did in the Wisconsin workmen's compensation law and extend it to unemployment prevention. It will work to the benefit of both employer and employe. It will do much to obliterate the hostility between labor and capital."

S.P.Q.R.+U.S.A.=C.P.Q.A.—at $17 a Minute

By A. R. PINCI

TWO thousand years ago the Romans had a Senate whose sovereignty was represented during parades by the cabalistic letters S. P. Q. R., which everybody has seen pictured and a few know what they mean. But the Roman Senatus was not so very much better than the American Senate, or, to put it differently, the American Senate is no improvement over the Roman institution, and probably costs more, because ours is figured in dollars and the ancient one in sestertii.

Some unidentified Latin wit who flourished about the year 0 or 00 said that "Senatores boni virl, senatus autem mala bestia," or in our vernacular, Senators are good old scouts but their legally constituted body is nothing to brag about. The French Senate has recently been alluded to as a gastronomic body; the modern Roman Senate is considered an old man's home, while the British House of Lords is disintegrating because whiskers are no longer the *sine qua non* of sapience.

So, taken by and large, constitutional government, parliamentally speaking, does not respect nationality. Parliamentally speaking means speaking about talkers. Etymologically, parliament means a place where to talk, but American Congressmen have indignantly refused to admit that they talk. They discuss and they confer. Occasionally, they elocute, and quote poetry or rhymed words.

There is a decided difference of opinion as between the taxpayer, who pays $1,061.74 an hour for its capitoline representatives at Washington, and the expenders thereof, who believe the people don't pay enough. They think they are worth more, and some actually say they are. They prove it by showing how they can make money for the people by taking it away from them via taxation.

Congress as It Sees Itself

MANY attacks have been made against Congress and individual members too. Humorists and dissenters have wrought satire at its expense, a not difficult thing to do, since a group of five hundred or so men, each representing idiosyncrasies that are perennially exposed, is human enough at times to oscillate from the sublime to the ridiculous. Yet our Congress is supreme and has no peer. Among themselves its members banter good-naturedly, laugh at their own pretensions, unmask each other's peccadilloes, and when one of them goes from their midst his colleagues hasten to find virtues with which no other mortal can ever hope to be credited. They will forgive everything except a member taking himself seriously, and this unwritten law is the safeguard of our legislative government. Ugly snarls are very rare and physical encounters rarer still.

Not that Congress is perfect—far from it. It is an artificial body held together by ambiguous and imperfect rules and regulations, and because it is subject to the human equation more than to anything else, it suffers now and then from kindred ills. Its sense of proportion, be it of value or utility, leaves much to desire. It is ready to vote tens of millions of dollars upon more or less futile laws but will retard the country's progress by withholding an extra and much-needed fifty thousand dollars. It is so human, however, that it makes the commonest of human mistakes—that of talking. It likes to talk about itself. The average member is so delighted with his job that like the little boy with his first pair of pants he likes to show off. He's no more conscious of showing off than is the child. He thinks he does the country a favor—which is a pose—by retaining his seat, but let there pass the word that he has opposition for it and lo! it is necessary to page an earthquake.

Congress is not an expensive institution in itself. It will surprise many to know that its cost last year was about nine cents an inhabitant. The bill was $9,300,895.53. By the hour it means $1,061.74, yet some of our best singers get twice as much for opening their mouths and making motions.

He Won Applause on This

CONGRESSMEN as a rule do not indulge in journalistic English. Here is a sample of oratorical fancy, in the name of the farmers:

"The men who live in great cities may let their lips curl in scorn and may let a laugh of derision appear on their countenance when we friends of the American farmer plead for relief for him; but I want to say to them that with all your boasted prosperity, with all your towers of brick and mortar which ascend toward the sky and receive the light of the morning sun, with all your busy looms and whirling spindles, that they will no more be heard and the sound of their wheels will no more vibrate in the air, and their palatial buildings which pierce the heavens will all become charnel houses of death and degradation unless you rehabilitate the farms of this country."

Applause? Of course; oodles and oodles of it. Three main topics can always be depended upon for applause, namely, the people, George Washington, the party; these in turn mean the farmers, the women, the workingmen; the Father of His Country, Lincoln, the Fourth of July, the nation; and the party—that means an eye to the coming elections. One of the profound mysteries about Congressmen is why they must quote poetry, a weakness that distinguishes the House rather than the Senate.

Because Congress likes to talk is not a serious thing; the joke is on Congress itself. Its maintenance expenses are fixed, and it costs the country just as much to keep at home as at Washington. The more its members talk the longer they must work and thereby cheat themselves. In the old days when both branches were "bossed" by recognized leaders only the privileged few talked and Congress adjourned promptly, its work done. Now about all of them talk—some with their fingers crossed, as it were, because they "extend their remarks." It is here that the gems of parliamentary literature are to be found if any one wishes to invite old age by a perusal of a few hundred million words.

To get a good slant at Congress it is more interesting to do it by jotting down the members' own appraisal of it. The following instances are from the proceedings of the last session.

"With fifteen Senators present," Senator Thomas said, addressing the Vice President, "the secretary, the reading clerk, the doorkeepers, the pages, and spaces filled with unoccupied and deserted seats—"

It was a caustic comment about absenteeism, which a few days before had tempted Representative Blanton, reputed to be the House's Peck's bad boy, to wax sarcastic because during the consideration of an appropriation bill involving several hundred millions of dollars only thirty members were present. He even suggested the adoption of shifts.

Senator Williams, of Mississippi, sharp as his middle name, in his observations said:

"This august body—and I call it by that adjectival description because it generally speaks of itself in that way—has reached a pretty pass if it cannot attend to legislation without unanimous consent." He alluded to the henpecking by leaders of the opposition.

Turning time back a few months, entertainment was never greater than when the question of the inaugural ceremonies was up for debate and the subject of kissing filtered in—the one ceremony Senator Borah had no objection against because it would not involve the Treasury. Even staid and unimpressionable Senator Knox found it insidiously pleasant, much to the delight of visitors.

Abraham Lincoln, it developed during the discussion, was kissed by or kissed (maybe both) thirty-four young ladies representing the states, and it was pointed out that if similar ceremonies were in order this year President Harding should be twelve kisses better off—glory be to the growing nation!

On another occasion, when voices mingled, the Vice President warned:

"The official reporters can report a duet, but not a quartet."

Even in defeat good nature is supreme. Champ Clark, beloved of the House, former speaker, defeated last year after thirteen terms, wanted to know why a Republican "came to have so small a majority as 22,000."

A drawback is the loss of time due to inconclusive investigations.

Argument at $17.69 a Minute

"WE HAVE not only the opposition of you gentlemen on the Democratic side," said Representative Graham, "but every time we get close to anybody who was a constituent of somebody we had opposition on our own side." This is an eloquent commentary upon investigations in general, which, though intended for the public good, frequently reduce themselves to political jockeying.

It is admittedly true that our Senate and House must be subject to some sort of self-imposed and recognized discipline, if parliamentarian chaos would be avoided; would, because it is not always successfully prevented; wrangles and snarls are occasioned during moments of high tension.

"It cost the taxpayers exactly $17.69 a minute for this sort of argument:

"Will the gentleman yield?"

"I dislike to refuse, but I have only four minutes."

"I do not want to take the gentleman's time, but I would like to supplement that if the gentleman will yield—"

"I cannot yield."

"The time of the gentleman from Alabama has expired."

"Mr. Chairman, I yield to the gentleman one additional minute."

"The gentleman from Alabama is recognized for one additional minute."

"Mr. Chairman, may I inquire how the time stands at present?"

"The gentleman from Iowa has fifteen minutes remaining, and the gentleman from Tennessee has fourteen minutes."

Debate was under way when interruption followed.

"Mr. Chairman, I make the point of order that the gentleman is not speaking to the item on the bill."

"Well, I will submit the question to the House as to whether I shall proceed for five minutes or not. But I have already received the consent of the House, and therefore I want to say, gentlemen, that—"

"I make the point of order, Mr. Chairman, that the gentleman is not speaking to the item."

"The gentleman from Iowa will state his point of order."

"The gentleman is not speaking to the item of the bill which is under discussion."

"Let us see if I am not. May I make a statement to the Chair?"

"The gentleman from Pennsylvania made a motion to strike out the last two words, and discussed that motion for five minutes, and then got unanimous consent to continue for five additional minutes."

"Yes, and I insist on my rights."

"I ask that the gentleman be allowed to proceed for five minutes out of order."

"The gentleman from Alabama asks unanimous consent that the gentleman from Pennsylvania may be permitted to continue during the remainder of his five minutes out of order. Is there objection?"

"Reserving the right to object, I stated to gentlemen on the other side of the House that I would make points of order on matters of this kind. My attention was not called to what the gentleman was discussing until we got into this uproar."

"No uproar at all."

"I must object."

"If the gentleman objects, I make the point of no quorum present."

"The gentleman from Illinois makes the point of no quorum present. The Chair will count."

While these technicalities, and such mysteries of verbosity as "out of order," speaking "to items" and "making a motion to strike out" cost money. Even the count of a quorum costs money.

Defeat—and Taxation

DURING the recent consideration of the appropriation bills the "economy streak" animated most Congressmen, but analysis of their attitude reveals that they have been, as usual in these circumstances, at cross purposes. Senator Ashurst made the startling comment some time ago that $2,000,000 a day in government expenses could be saved if members of Congress "did not fear defeat by their constituents" for being economical. Now this is no idle assertion. It comes very nearly to being so. Every constituency wants economy practiced at Washington, but at the expense of other constituencies. Every Congressman feels it. For instance, one member was defeated two years ago because he sponsored a bill requiring government clerks to work eight hours instead of seven and a half. It was an efficiency and logical measure, but politics and manipulation defeated its author. It is, moreover, an unpleasant example; as a commentary upon the attitude of voters toward efficient representation it is not complimentary to otherwise level-headed voters.

The Senate on its part has been the object of anathema for several years. This antagonism has gravitated toward a few of the better-known members, whose attitude has been obviously misinterpreted. Without entering into the merits of any controversy, it has become evident that the Senate wishes to remain the peer of the Executive. President Roosevelt was the first to deflate it by "big stick" methods only to realize that at best he made only a few dents. President Taft permitted it to go on like the legendary brook. His successor reined it in with something of a shock. The minority of the period was unable of course to combat the new master, and the majority never opposed orders. After losing sovereignty over itself in the Panama Canal toll law and thereby ignoring constitutional duty the Senate—or part of the Senate—forgot initiative until 1918. Strangely enough, it regained mastery through a slip of the very hand that had bound it; the fateful pre-election message of 1918 nullified previous authority.

It is frequently said that the Senate now is a poor imitation of the body it was twenty or thirty or fifty years ago. Never was a greater mistake made. There are fewer bosses and there are fewer second-rate men. Naturally, a few names stand out more conspicuously in the affairs of the day, but this does not imply that the rest are not capable men.

Half a century ago a single address was enough to make a member famous. Life was not so insistent and involved, and the country was willing to ponder over that one speech for several months, until another important one would displace it. Today brilliant speeches, regardless of subject, happen every day. And a member's speeches are no inconsequential matter; he faces defeat as he looks into the future far more than he begets glory as he regards the past. By political custom what good deeds a Senator or Representative has done are of little consequence; the last elections showed many going to defeat who for years had graced both houses and had served their constituents with utmost care.

Voters Must Change, Too

ONE thing is becoming more evident; Congress has evolved into an institution for youthful men, a quality that has no relation to age. Not dawdling along complacently, but most of the time driving itself to keep up with the dizzy march of events, it is not possible for members to become noted by their wit—not when the people are measuring by taxes. My observation is that the people, too, are unwilling to have fame descend upon their congressional representatives on the slender thread of quick wit.

One point must be made clear. If Congress is to be bettered, it is not by means of a change of personnel, but by a better understanding on the part of the voters. If voters vote intelligently it is certain that only intelligent candidates will run for office; this eliminates fraud, graft and misunderstanding. An intelligent electorate will not burden its chosen representatives with anomalous or onerous tasks that in the aggregate will not do the country much good even if they prove harmless.

The best-known Senators and Representatives are those who concern themselves not at all about pork and patronage. Yet they share in anything to which they are entitled. Their constituents rely upon them for their discretion and even if partisanship is sharp, their unbiased statesmanship.

In 1820 it cost the government about $24,000,000 to run itself; a hundred years later it cost $6,133,716,757. Congress by itself cannot make reductions; the people themselves must meet it halfway.

War and Money

"THE next war" is a phrase on everyone's lips and to some it seems prophetic. That the last war was advertised as being "the war to end war" is well enough known, but there is a growing conviction that it did not live up to its reputation in this regard. The Peace Conference sowed the seeds of half a dozen wars, and even before the Peace Conference was called, the thing called Bolshevism had been firmly planted in Russia, from which it proceeds in radiating vexation to the whole world. If there is more fighting destined for the future, it will not be another war but a renewal of the last one, in which the real enemy and the real cause of war will be more clearly perceived.

One point seems to be reasonably clear, namely, that it is no longer possible to argue the financial situation of the nations as a prohibition against war. That is commonly done today: "The nations cannot afford any further fighting; they have no money to meet the expense of war," are statements heard on every hand.

The next war may not need money. Men and materials are the only two essentials of war. The world has already been schooled in the ease with which the one can be conscripted and the other confiscated. The theory of eminent domain is equal over men, materials and money, the possession of the first two rendering the third unnecessary in an emergency.

That is to say, a renewal of war may witness the absolute abolition of profiteering, and the "last of all wars" may also be the end of the money system which is one of the most pathetic jokers with which humanity has been saddled. And it is pretty certain that a profitless war will be the end of those influences whose chief interest in war is that it is a great money-maker.

Since 1914 much of the old ground on which the thought of mankind stood has been swept away. No one any longer predicates impossibility for anything. The struggle which ended in 1918 left the world with a sense of futile incompleteness; something attempted was not done. This something which is felt not to have been achieved is not the subjugation of any nation, but the elimination of certain forces which use nations as their pawns. The world is not changed, save that it has lost millions of its best, and has been sorely wounded in its dreams of peace.

The task which faces those who remain is harder than that which faced those who answered the bugles in 1914 and 1917. Disarmament must come, but through what process of readjustment, which must precede, it is difficult to forecast.

No blow so hard has ever been given the money system as the manner in which the governments manufactured it during the war and kept it usable, leaving it to the people to bear the heavy shrinkage which followed immediately after. During the last war the governments played with the superstition of money and made it work, but even the gold-god is now understood to be stuffed with sawdust.

Education for Work

THE real education of any man begins after he leaves school or university and starts in life—which means starts to work. In the old days, it was the fashion to sneer with nose in air at the idea that schooling to be of any real value should be a preparation for business. Only timidly and slowly has the academic aegis been extended over schools of law and of medicine, of dentistry and engineering, of horticulture and agriculture. "Trade" was long regarded, even in our own democratic republic, as somehow demeaning to an "educated man," and the practical business man reciprocated with cynical contempt for the "college man" in business. Now business bulks large in the curriculum of every large American university and schools of commerce, accounts and banking, as of technical training in industrial administration, are growing in importance each day.

The old college ideals were keenly satirized by the late Elbert Hubbard in his "Forbes of Harvard." Having pursued a university course after he had reached the age of 35 and made a fortune in business, Hubbard knew whereof he spoke. He never tired of making merry with the idea that a man could be educated by separating himself for four or six years from actual life and work and living under artificial conditions that fostered indolence and false ideals and notions. To him it seemed that life should be an education and education a life. The fundamental error of the old system which still lingers in full force in many countries was that it made a separation that nature never made in disjointing training and preparation from the very activities with which they were supposed to be concerned. This cloistral character, of course, is a survival of the historic origin of the university in the medieval monastery.

So it is exceedingly encouraging to find that educational ideas and educational systems are undergoing a change in the right direction. A particularly promising modern instance is the new departure of Union College of Schnectady, New York. Thanks possibly to its century-and-a-quarter of age, this institution swings into line a little late with its "drive" among its own alumni for three million dollars. But its forceful and businesslike appeal for money contains something more significant than the familiar cry for more buildings, equipment, higher salaries and general enlargement to take care of the vastly increased throngs of young men now seeking a "liberal education."

This is the definite avowal that size is not Union's ambition; that she prefers to receive fewer students and to take them further. This is to be done by making available to them all the opportunities and advantages of one of the greatest manufacturing plants in the world, that of the General Electric Company. Its shops, laboratories, lectures and specialists are to be placed at the service of selected Union students. Thus theory and practice will go hand in hand, in accordance with a working plan arranged by Willis R. Whitney, director of the general statistics research laboratory, and himself a Union man. Effort will be concentrated on the fundamental creative sciences, chemistry, electricity and biology. Instruction will be by the highest authorities, with practical application directed by successful men of affairs.

President Richmond, of Union College, while in fullest sympathy with this plan for the training of brilliant men and specialists, holds, with true sense of proportion, that "the real end and aim of education is to humanize the man, enlarge his horizon and increase the number of his sympathies; not to make the most for himself, but to make the most of himself in the upward struggle of mankind toward light and happiness."

Here surely is an ambition worthy of any college.

Our Foreign Trade

THROUGHOUT the history of this nation there has been a steady growth in its foreign trade and such growth has ever been an index of the actual growth of the country as a whole in wealth and productiveness. The increase in the last 100 years has amounted to 1,000 per cent. In 1820 the total was $127,560,106, or $13.23 per capita; in 1920 it had risen to $13,508,157,959, or $127.81 per capita.

Cotton and wheat determined our export balance in 1820, as it has for the greater part ever since; but the era of railroad and telegraph, with the larger use of machinery and constant improvement in industrial processes is marked by diminishing preponderance of these staples in our exports. The volume of American iron, steel, oil, copper, machinery and manufactured goods sold abroad, shows steady increase during this period. Both relatively and in gross, our export balance in 1820 of $2,388,658 was very small compared with the export balance of four billions in 1919, or that of three millions in 1920; but it marked a beginning of profitable business with Europe and the East.

For any genuine revival of business today with corresponding industrial activity, and full time employment at good wages for the workers, it is of the utmost importance that Congress shall take early action in the direction of removing or encouraging the removal of existing obstacles and hindrances to the restoration of our foreign trade to its pre-war volume—and to refrain from the enactment of measures likely to discourage rather than stimulate either our exports or our imports. Trade means buying as well as selling; it is not a one-sided operation.

"Old Joe Wordle"

MANY of us must have been struck by the picture in the daily papers of "Old Joe Wordle" making his first call on President Harding at the White House. His kindly features, his closely buttoned up overcoat, his stovepipe hat of ancient vintage, the umbrella under his arm, all mark off this old-fashioned octogenarian from the run of White House callers in these days.

But more than his outward appearance makes him distinctive and commends him to thoughtful attention. In the pictures, this old gentleman is departing from the White House, a big bunch of flowers in one hand and in the other a strapped cardboard box presumably filled with more flowers. These flowers suggest eloquently the nature of the man and his message. For lo, these many years, Joe Wordle, who is now 87, has made it his chief business in life to call daily, summer and winter, to receive the blooms culled from the White House conservatories or sent to the First Lady of the Land by friends and admirers. These flowers he distributes to poor and sick children in the hospitals and in the slums of the national capital.

Faithful to his self-imposed task, good old Wordle has seen Presidents come and Presidents go. Through the administrations of Grant, Hayes, Garfield, Arthur, Cleveland, Harrison, McKinley, Roosevelt, Taft and Wilson, he has been a living link of benevolence and a radiating messenger of gracious human sentiment from the nation's heart in the home of the Executive to the afflicted children of the people. For of course it is something much more than fugitive blossoms that Joe Wordle collects and distributes. The flowers are God's poems, the scented and tinted reminders of love eternal; condensations of nature's beauty and charm. In these spring days, especially, they bring home to us the great miracle of earth's ever renewing life, its purity, sweetness and light. In their freshness and delicacy, they speak strength to the weary, hope to the depressed, cheer and comfort to those sick at heart and suffering on beds of pain.

One is reminded of the stories of Walt Whitman coming into the wards of the military hospital at Washington during the Civil War carrying great armfuls of wild flowers that he had got up early to gather in the fields and woods along the Potomac. We are told that the breath he brought from God's great out-of-doors had an electric effect. The dull eyes of sick, wounded and suffering soldiers brightened with a sense of life and hope renewed. As the "Good Gray Poet" gave himself in red-blooded manly fashion with his flowers, so, we may feel sure, does Old Joe Wordle touch the hearts and brighten the lives of the children to whom he takes the White House flowers. One can see his warm-hearted sympathy reflected in the glistening eyes of the little ones and the merry laughter that tells how more healing than medicine is gladness of heart.

For all of us, the flowers beckon from the obsessing strife and dulling routine of the city to the woods and fields. Deepening our sensitiveness to the impressions of beauty and sanity which every little wood anemone and every "lily of the field" holds for us, we will become refreshed and renewed like the buds. And the best proof of our enrichment and vitalization will be an intensified desire to pass along to others the joys we experience.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912.

Of THE DEARBORN INDEPENDENT, The Ford International Weekly, published weekly at Dearborn, Michigan, for April 1, 1921, State of Michigan, County of Wayne, ss.

Before me, a Notary Public, in and for the State and County aforesaid, personally appeared Fred L. Black, who, having been duly sworn according to law, deposes and says that he is the Business Manager of THE DEARBORN INDEPENDENT, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in Section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business managers are:

Publisher, The Dearborn Publishing Company, Dearborn, Michigan; Editor, W. J. Cameron, Dearborn, Michigan; Managing Editor, W. J. Cameron, Dearborn, Michigan; Business Manager, Fred L. Black, Dearborn, Michigan.

2. That the owners holding more than one per cent of the stock are:

The Ford Motor Company of Delaware, as a holding Corporation; Henry Ford, Dearborn, Michigan; C. J. Ford, Dearborn, Michigan; E. B. Ford, Detroit, Michigan.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

FRED L. BLACK,
Business Manager.

Sworn to and subscribed before me this 24th day of March, 1921.

J. EMMET HALL,
(My Commission expires September 29, 1924.)

Mr. Ford's Page

JOHN BURROUGHS has passed on, yet instead of saying that the world is poorer for his going, it is perhaps more correct to say that the world is richer for his having lived. His great genius lay in his ability to see when his eyes were open (a gift which is offered to all but which few accept and cultivate) and his great service lay in keeping us aware of the beauty of the world which he saw.

In looking back over his life it is plain to see that it falls into two parts as far as his main work was concerned. In those years during which he did the work that won him the friendship of children and grown folk, he was looking out all the time. He saw the outer world. He heard the sounds of the outer world. He inhaled the odors of the earth. His eye was fastidiously trained in the perception of natural tints and tones. His soul had a delicate sense of Nature's moods, so that he seemed to be almost at one with the living planet on which he walked and of whose life he was always conscious. In the woods he seemed to merge with the trees, and on the hills he seemed to be a moving part of them.

He was not a professional naturalist, nor did he make sentiment do for hard research. It is easy to grow sentimental out-of-doors, it is hard to pursue the truth about a bird or a weed as one would pursue a mechanical principle. But John Burroughs did that, and as a result the observations he set down were very largely accurate. If he was inclined to impatience at all, it was with men who were not accurate in their observations of natural life. If the thing was worth writing about at all, it was worth following for its own sake. John Burroughs first loved nature for its own sake; it was not merely his stock of material as a professional writer. He loved it before he wrote about it; and loved it more though latterly he wrote of it less.

And then, late in life, the observer turned philosopher. Human nature asserted itself with the ageless questions which man has always put to himself and to the Great Outside. John Burroughs' philosophy was not so much a philosophy of nature as it was a natural philosophy, the long serene thoughts of a man who had lived in the tranquil spirit of the trees. He was not pagan; he was not pantheist; but he did not much divide between nature and human nature. And this was distinctive in him, whether true or not. He felt he had to formulate a clue to it all; whether he fully satisfied himself, he alone knew. Perhaps not; it seems to be ordained that in faith and not sight man finds his deepest rest. Even the scientific clue that most satisfies, rests on something not yet seen, still to be achieved.

But through it all John Burroughs lived a wholesome life. He was fortunate to have as his home the farm where he was born. For a long series of years his surroundings had been those which made for quietness of mind. He loved the woods and he made dusty-minded city people love them too, because he could help them in the mirror of his words to see what he saw there. The children of city schools felt the dew of the farmlands in his sketches and caught the scent of meadows in his little books.

John Burroughs did not make much beyond a good living. He could have done so, perhaps, but that was not his business. Like another American naturalist, his occupation could have been described as inspector of birds' nests and hillside paths. Of course, that does not pay in dollars and cents.

He had a grudge against money for the way in which it empowered vulgar persons to despoil some of the loveliest places. He detested those who cast an architectural spasm on the countryside, and when they patronizingly observed him also as one of the quaint objects in the scenery, he could be as biting as the first frost.

JOHN BURROUGHS was known wherever birds and trees were loved, and he was respected not only for his accuracy as an observer, but for his lack of professional attitude toward Nature. He lived more than most men do, though to the practical eye he may seem to have produced nothing but observations on Nature; he lived in every fiber of his being—he saw more, heard more, and inwardly sensed more than many a man who has made a bigger noise. First he used his eyes, and then he ruminated on what he saw; by seeing he became a Seer. Yet he was not a recluse nor a bookman. His books he did not regard as literature, but as messages to his friends. He was as ready for new adventures when he died as ever he was, and as ready for the adventure he then made. The world is richer for John Burroughs.

At one time in his life he had a grudge against all modern progress, especially where associated with the burning of coal and the noise of traffic. Perhaps that was as near to literary affectation as he ever came. Wordsworth disliked railways too, and Thoreau said that he could see more of the country by walking. Perhaps it was influences such as these which bent John Burroughs for a time against industrial progress.

But only for a time. When he was past the allotted three score and ten, he came to see that all the world could not go hunting birds' nests. He came to see that it was fortunate for him that others' tastes ran in other channels, just as it was fortunate for the world that his taste ran in its own channel. There has been no observable development in the method of making birds' nests since the beginning of recorded observation, but that was hardly a reason why human beings should not prefer modern sanitary homes to cave dwellings.

This was a part of John Burroughs' sanity. Thoreau, doubtless, died too early because he was not sensible in his use of the out-of-doors; John Burroughs could never have been guilty of that. He was a lover of Nature, not her dupe. And this sanity characterized him everywhere. In the course of time he came to value and approve modern devices, and though this by itself is an interesting fact, it is not so interesting as the fact that he made this change after he was 70 years old. John Burroughs was never too old to change. He grew on to the last. Doubtless he began to philosophize again after he had left us, as soon as he got his bearings, unless perchance new living flowers or the true birds of paradise drew him off on an expedition.

The man who is too set to change, is dead already. The funeral is a mere detail.

John Burroughs had an easy sense of humor. It was like a little brook which one hears dimly in the undergrowth. You knew it was there, but it did not always break upon your ears with distinct challenge. He had a whimsical command of words. In the far woods he would stop and rail upon himself for coming so far to "seek discomfort," and his favorite descriptions for roads which wracked the frame was "undeveloped macadam."

He knew a great deal about the healing of silence. When, at Havana, the word came that his wife had died, he simply said that he thought he would be alone for that day, and he walked and walked under the sky. When he came home he had reached a certain adjustment of mind which took in the great change.

He seemed hardly to know that he was famous. He did not think his books were great productions. He took his friendships with great simplicity of loyalty. There was not much beside himself that he could give, but he did not know that it was himself that people most wanted. His deeper thoughts he did not know as deep; they were the observations he made in some deeper recess which he had penetrated in search of truth.

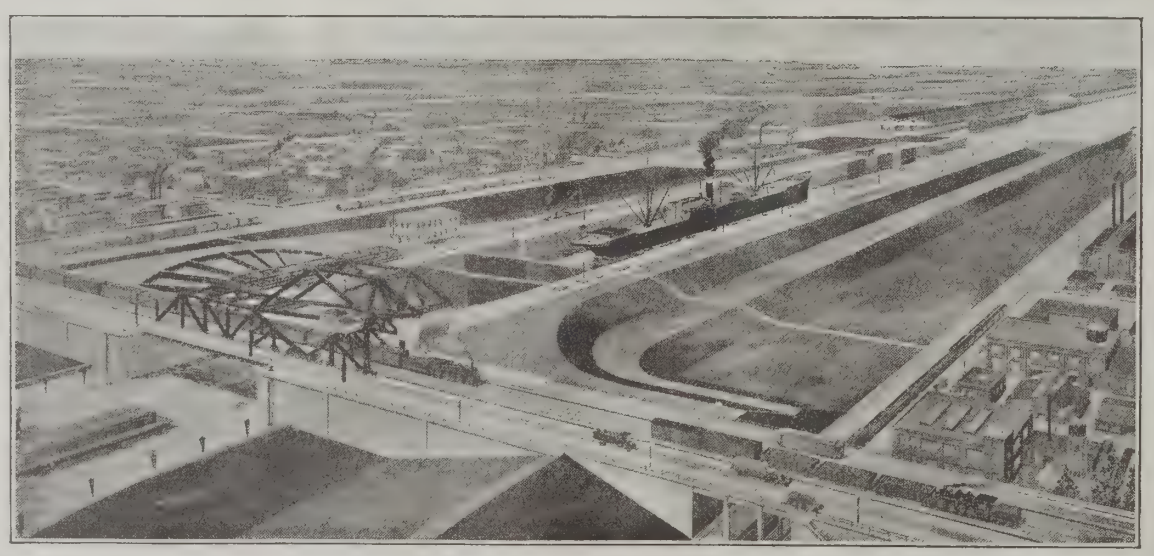
If he talked more of one person than another, it was Emerson. Not only did he know Emerson by heart as an author, but he knew him by heart as a spirit. He frequently referred with a chuckle to the time an anonymous article of his was attributed to the Concord sage. He had so saturated himself with Emerson that at one time he thought like him and even fell into a mode of expression like his. But afterward he found his own way, which for him was better.

There is no sadness in John Burroughs' death. When the grain lies brown and ripe under the harvest sun, and the harvesters are busy binding it into sheaves, there is no sadness for the grain. It had ripened and had fulfilled its term, and so had John Burroughs. With him it was full ripeness and harvest, not decay. He worked almost to the end. His plans ran beyond the end. They buried him amid the scenes he loved, and it was his 84th birthday.

Louisiana Completes $25,000,000 Canal

THE state of Louisiana and the city of New Orleans, working together, will dedicate, on May 2, of this year, the latest and, so far as the writer knows, the largest inland waterways project ever brought to successful completion in North America, and, next to the Panama Canal, the largest ever undertaken in the New World. This project is the Inner Harbor-Navigation Canal, connecting the Mississippi River with Lake Pontchartrain, Lake Borgne and the Gulf of Mexico, and passing directly across the lower industrial section of the Crescent City.

While the waters of the Mississippi will not be turned into this canal until September or October—owing to the high and dangerous stage of water which prevails within the great levees controlling this stream—the canal, including its great concrete and steel lock, will be complete and ready for the water by May 1. The tide-level part of the canal—that stretch which reaches from Lake Pontchartrain to within a few hundred yards of the great lock—has been in service for more than a year, with two shipyards operating on its banks, sending their completed steel hulls out across the shallow waters of the lake to the Gulf of Mexico, and thence around and up the Mississippi River for delivery to their owners in New Orleans. Full service of the inner harbor, however, cannot be offered until the lock into the Mississippi River is opened, since it is a costly and tedious task to handle shipping of large size across a lake whose maximum depth is 14 feet and whose average depth is rather less than nine feet.



The dedication of this canal is the culmination of nearly ten years of steady campaigning, propaganda, educational and financial work by those who first conceived the idea of the canal, while approximately four years have been devoted to the actual work of digging the canal, and the lock has been under construction for nearly two years. Physically, the Inner Harbor-Navigation Canal is five and one-half miles in length, 300 feet wide at the surface of the water, which is 30 feet deep at low tide in the Gulf of Mexico, and 150 feet wide at the bottom. It runs in an almost straight line north from the river for about half its length, and then turns a trifle west of north for the remainder of the distance. About one-third of the distance from the river, there is a large turning basin, for ships, and the entire canal affords about 11.5 miles of protected water front for the establishment of ship-building and ship-repair yards and other industries, which, however, have been very slow in coming in.

This water-front land, while owned by the city and state, differs from the water-front lands on the Mississippi River part of the harbor, since it can be leased for long terms to corporations or individuals for the establishment of terminals, shipyards, warehouses or industrial plants. The Doullut & Williams Shipbuilding Company, Inc., has established a shipyard there and has constructed a number of 9,600-ton steel steamers for the United States Shipping Board, taking these large vessels out across Lake Pontchartrain to the Gulf of Mexico under their own power. The Foundation Company, of New York, also established one of its yards (No. 12) on this canal, to construct several non-sinkable ships for the French Government, but, owing to what it considered unfair taxation, and other inimical reasons, this company has closed its yard, apparently permanently.

The northern end of the canal gives into Lake Pontchartrain at tide level of the Gulf of Mexico, but at the river end, the canal is controlled by a massive concrete and steel lock, 1,050 feet long, 160 feet wide outside, with a usable inside box 75x600 feet, in which vessels up to 20,000 tons can be handled. The high waters of the Mississippi River, averaging some 22 feet above the level of the canal, are controlled by two sets of gates, each set weighing 400 tons. The Public Belt Railroad, which is owned and operated by the city of New Orleans, crosses the canal, between the lock and the river, on a 6,000-ton bascule bridge, which also carries street car lines, roads for vehicles, and two sets of sidewalks. This Public Belt, which now connects all the publicly-owned wharves, warehouses and facilities of the main river port with the stations of the 11 trunk lines of railroad entering New Orleans, will run along both sides of the new canal, and connect it and all its industries with the wharves and rail lines of the main port. All the operation of this lock, which is the second largest in the New World, being exceeded only by the locks on the Panama Canal, is by electricity, and the switchboard consists of a replica of the lock, with indicators showing the opening and closing of the gates, rise and fall of bridge, height and movement of water, and passage of ship or other craft through the lock. The operator, though housed with his switchboard several hundred feet from the lock, at all times sees before him the actual result of every switch he throws or each lever that he moves. This switchboard is modeled after the one used at the Panama Canal locks. There is no gate or other closing or opening device at the lake end of the canal.

The cost of the canal was at first placed at $4.000,000, with an outside limit of $5,000,000 but increases in costs of labor and materials, alleged wasteful extravagance of some parts of the construction management, and other elements combined to raise the cost until now the latest figures are between $20,000,000 and $25,000,000—probably closer to the latter figure than to the former. This is a cost, on the average, of ten dollars for every man, woman and child in Louisiana, and the interest on the bonded indebtedness alone amounts to approximately $1,250,000 annually. There has been considerable opposition to the construction of the canal from the time the project was first presented to the people of the state, but, rather more than a year ago, the officials of the state, the financial interests, the proponents of the canal, the industrial corporations and the newspaper owners of New Orleans met and decided that the canal must be carried through to completion. The cost of $25,000,000 was provided for by the financial institutions agreeing to handle the bond issue, and the work continued to the present ending.

The canal belongs to the state of Louisiana and the city of New Orleans, jointly and forever, just as do the water-front lands of the port of New Orleans. It will be controlled and operated—as are the lands of the main port—by the board of commissioners of the Port of New Orleans. Its revenues are to be derived from the rentals of the lands along the inner harbor and from the tolls of the lock. Small craft entering the inner harbor and canal from Lake Pontchartrain, and not destined for New Orleans, apparently will be able to enter and clear free of charge, but all vessels passing either to New Orleans from the sea, or to the sea from New Orleans, will have to pay tolls at the lock.

LOCK OF THE INNER HARBOR-NAVIGATION CANAL AT NEW ORLEANS

An effort is now being made, however, to have the Federal Government take over the canal as a part of the Intercoastal Canal, connecting the eastern and western sections of that canal, across the Mississippi River, and thus make the lock and canal free of tolls. Up to the time of this writing, there has been no result, either favorable or unfavorable, to this effort. The dedication will be held at the time of the annual convention at New Orleans of the Mississippi Valley Association, at which will be present delegates from 26 states, including the governors and other high officials of several of them. At this convention the importance of this inner harbor and canal to all the industries, all the shipping and all the rail-water traffic of the Mississippi Valley, from St. Paul to the Gulf and from the Alleghenies to the Rockies, will be impressed on the delegates.

Crow's Nest View of Newest Waterway of United States

THE Inner Harbor-Navigation Canal at New Orleans, the latest inland waterway development to be attempted in the United States—

Connects the Mississippi River and New Orleans with the Gulf of Mexico.

Is five and one-half miles in length, 3oo feet in width at the surface, 15o feet wide at the bottom, and 3o feet deep at low tide in the Gulf of Mexico.

Runs north from the Mississippi River into Lake Pontchartrain, directly across the lower part of the city of New Orleans.

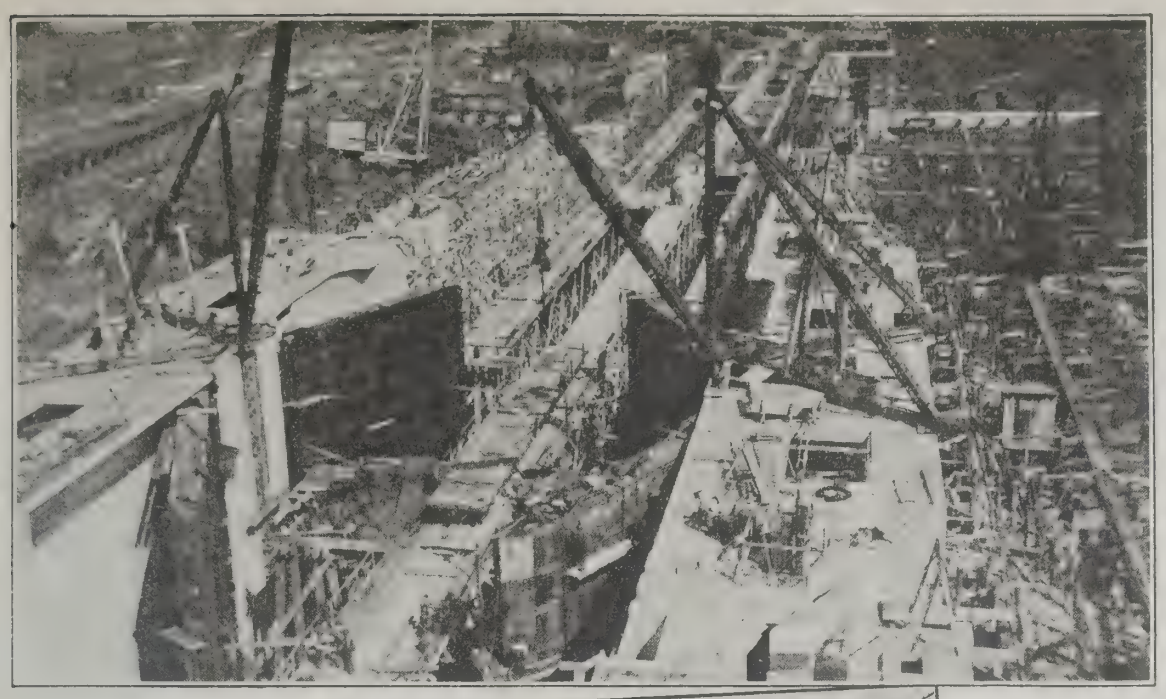
Runs into the lake at tide level, but reaches the river through the second largest lock in the New World, exceeded in size only by the locks on the Panama Canal.

Cost approximately $25,ooo,ooo, or about $1o for every man, woman and child in the state of Louisiana.

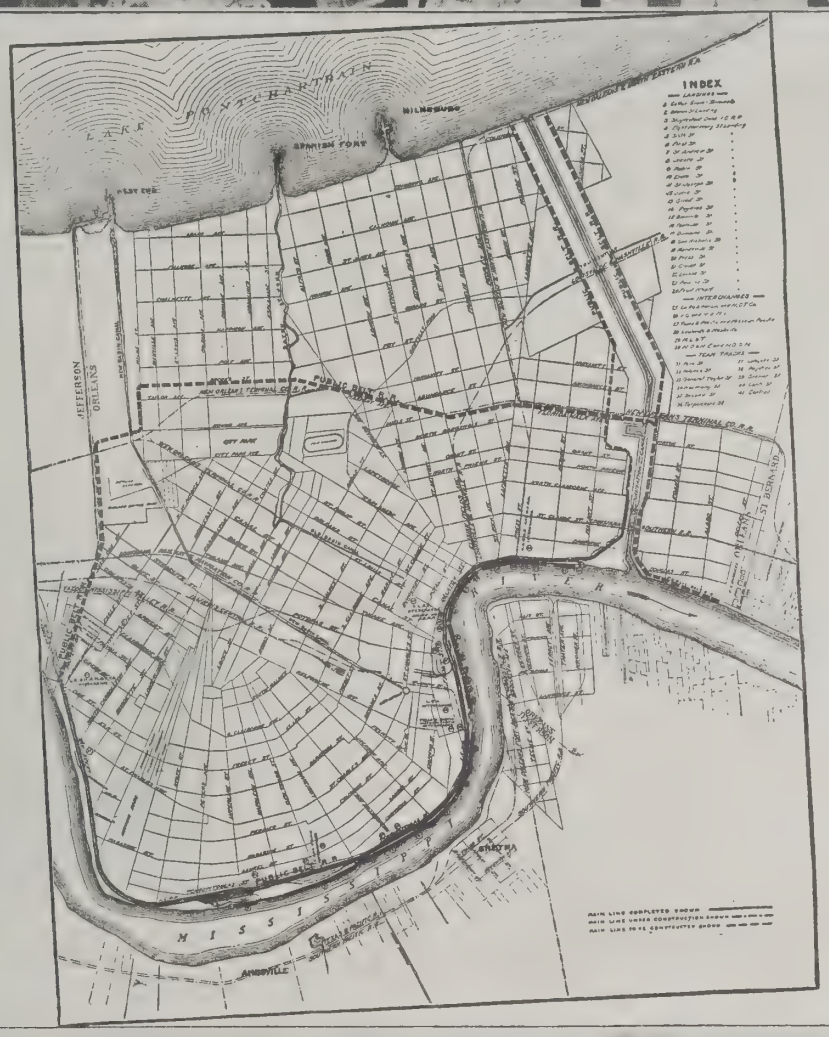
Was constructed by the state of Louisiana and the city of New Orleans, and will be operated jointly by state and city, through the board of commissioners of the Port of New Orleans.

Will be dedicated May 2, 1921, but will not be connected with the Mississippi River until September, when the present high water stage of the river has gone down.

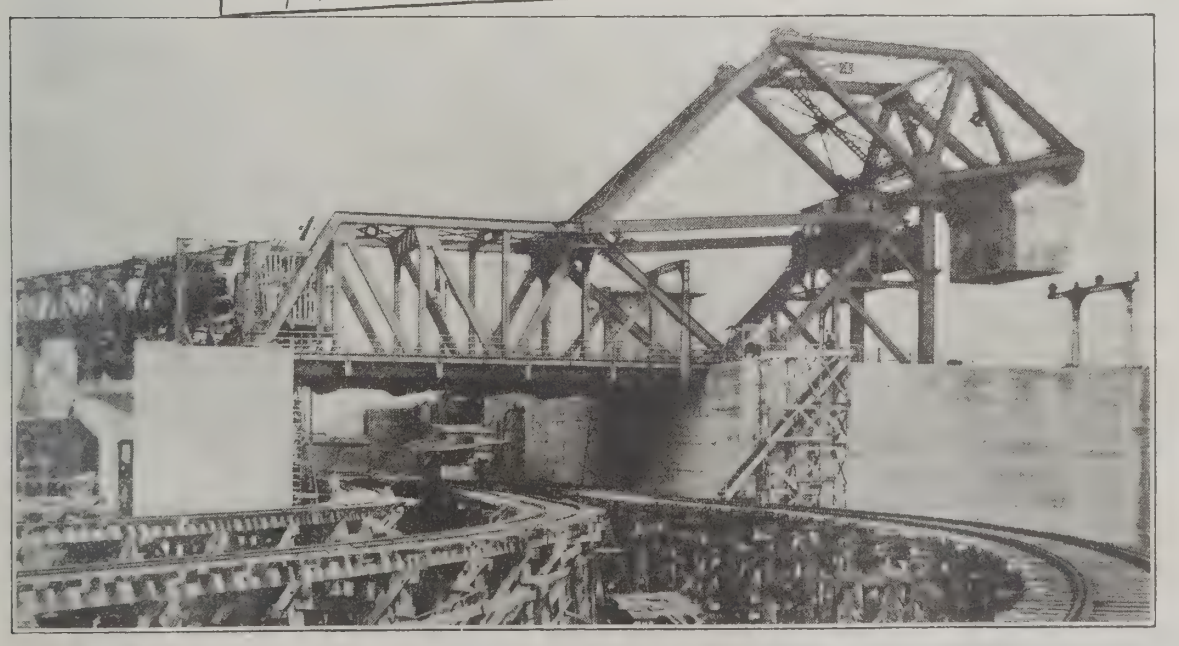
The most important feature of the Inner Harbor-Navigation Canal, and the main reason for which it was constructed, is that it furnishes a means to cut off rather more than 40 miles of the distance by water from New Orleans to the Gulf of Mexico. This distance, by the winding course of the Mississippi River, as at present used by all deep-sea traffic, is 110 miles. By the new canal, this distance can be reduced to somewhat less than 70 miles. But—and this is a big word in this case—this cannot be accomplished so long as the nine-foot waters of Lake Pontchartrain, and the eight to ten foot shallows of Mississippi Sound lie between the outer end of this canal and deep salt water in the Gulf of Mexico. This means that large vessels cannot go out over this lake and the Sound until a channel, approximately 60 miles in length by at least 200 feet in width and some 35 feet in depth, is dredged clear across Lake Pontchartrain, through one end of Lake Borgne, and across the Mississippi Sound into Ship Island Pass, the deep channel which connects the open Gulf with the island-protected waters of the Sound.



The Federal Government has been asked to dredge this channel, but so far has neither agreed nor refused to undertake the work. Estimates of reliable private engineers place the cost of this channel at $12,000,000, the time required to dig it at two years, and the annual expenditure necessary to keep it open at approximately $300,000 a year. The jetties at the mouth of the Mississippi River, without which that stream could not be kept open to deep-sea traffic, however, cost about $12,000,000 and necessitate an expenditure of very nearly $300,000 annually to keep the channel open. Every ship which comes into or goes out of New Orleans, steams 80 miles farther by following the river than she would have to do if this channel across the lakes and Mississippi Sound were open. This means 80 miles more coal, ten to twelve hours more time, more wages, and altogether heavier expenses on every ship. Theoretically, it appears that the channel across Lakes Pontchartrain and Borgne and Mississippi Sound, connecting the Inner Harbor-Navigation Canal with the deep waters of the Gulf, would be a good investment; one which would pay for itself, in economy to shipping alone, in a few years. That, however, is a matter for government and government engineers to decide.



The next most important reason back of the costly construction of this canal is the fact that it adds almost twelve miles of protected water front to the harbor of New Orleans. The great feature of this is that this new water front, which exceeds in extent all that has been developed through public ownership and operation of the main harbor of New Orleans during the past 200 years, is that it is susceptible to development by private capital. That is to say, private capital may obtain long-time leases on this land fronting on the Inner Harbor-Navigation Canal, for construction of terminals, wharves, warehouses, ship-building yards, ship-repair plants, and similar port facilities. The land itself belongs in perpetuity to the state of Louisiana and the city of New Orleans, but all the wide right-of-way, on both sides of the canal, is subject to lease. The question of rentals and canal tolls is up before the board of commissioners of the Port of New Orleans at the time of this writing, and, when this is settled, doubtless there will be applications for sites from a number of industries which, owing to public ownership and operation, have not been able to obtain sites on the main river harbor.



But it is as a link in the Intercoastal Canal that the big New Orleans canal at present shows its greatest prospects of immediate usefulness. The inland waterways and shallow, protected coastal waters of the five Gulf states now sustain fleets of small steamers, large motor freighters, schooners and auxiliary schooners, estimated to number more than 10,000. Their traffic, in the aggregate, is huge, and many sections of the remote South have little connection — passenger, mail or freight—with the outside world save by these boats. But this fleet, large as it is, is limited in its scope and development by the fact that virtually all the inland waterways of the South, with the exception of Mississippi Sound, and the canals leading out of New Orleans, run north and south. There is no great east-and-west waterway, binding all these north-and-south avenues of trade into one waterway system.

Passing from the eastern half of the rim of the Gulf, where they follow the protected waters of Mississippi Sound, through Lakes Borgne and Pontchartrain, these coastal freight, passenger and mail carriers can come through the Inner Harbor-Navigation Canal directly into the heart of the Port of New Orleans, without having to travel on the open Gulf to the mouth of the Mississippi and thereafter battle the heavy tide and tricky currents of that stream for 110 miles to reach New Orleans.

The new canal not only links all the Gulf states in a close bond of waterways, but it connects the traffic of the Mississippi Valley, the greatest industrial center in the world, with the deep seas of the entire globe.

Top—The $7,500,000 concrete and steel lock at the Mississippi River end of the Inner Harbor-Navigation Canal, looking toward the completed section of the canal, visible in the distance, and Lake Pontchartrain. The two sets of gates shown in the lock weigh 400 tons each.

Center—Map showing the location of the canal and the route of the Municipally-Owned Public Belt Railroad.

Bottom—The 6,000-ton bascule bridge which swings over the river end of the lock on the Inner Harbor-Navigation Canal at New Orleans, carrying the tracks of the Public Belt Railroad, the street car lines, a highway for vehicles and two sidewalks for pedestrians.

From Workhouse to Parliament

WILL CROOKS, the workhouse boy, has resigned from the British Parliament. British Labor made the mistake of trying to give this old East London constituency to a pacifist, Ramsay Macdonald, and lost the seat to a "Germany can and must pay" candidate.

But Will Crooks is himself a symbol of British labor. He is unique. That is why, now he is sick, there arrive on the heels of each other, a crested note of inquiry from King George and a round robin of sympathy from the Poplar soup-kitchen. There is a reason for that; and the reason is that the life story of Will Crooks is one of the romances of modern England.

Born in a one-roomed house in East London, he was familiar from infancy with poverty and hunger. For a brief while he was in a workhouse school. When 11 years old he began a life of hard, hard toil.

The experience would have soured and embittered many men. It broadened and deepened and created an infinite pitifulness in Will Crooks. When his fellow-workmen, understanding his grasp of public affairs and his sound common sense, elected him as their leader, he used his power for the benefit of the poor. As London county councillor, guardian of the poor, mayor of Poplar, member of Parliament and member of the king's privy council, his life work has been consistent.

Today as the Right Hon. W. Crooks, P. C., and recently M. P., he remains unspoiled by success. He lives among his own people in a little two-storied house in Poplar. His home is a center to which those in distress have been wont to flock all day long.

His wit, his homely sincerity and his genuine kindliness of heart have made the world his friend. When in the spring of 1917 he was struck down by a serious illness, the king sent to inquire after his progress, peers and bishops waited for news of him, and in many a back room and workhouse ward there were heavy hearts until he was out of danger.

Here is how, some few years ago, Will Crooks described his career:

"I am a Poplar man. I was born in Poplar, in poverty, in a little one-roomed house, in 1852. As a lad I was apprenticed near by to a cooper. Thirty years ago the workingmen of Poplar chose me for my first public office, a member of the board of trustees. I live in Poplar today."

Perhaps this simplicity reflects the simplicity of the man, whose whole public career has been unmarred by a single charge of bad faith, of shiftiness, of forgetfulness of the folk he represented. It explains also the reason he is loved so completely, and so far beyond his Poplar circles.

Poplar is part of the great working class quarter of East London, which starts at Whitechapel and stretches to Canning Town, the largest solely industrial quarter in the world. There is no leisured class, no middle class, nothing but workingmen and the tradesmen who supply them. East London is a natural reservoir for casual and shifting labor. In pre-war days, advertisements of factories to let in Poplar added as an attraction the words "abundant supplies of casual labor to be had."

Before the war the people of this East End were the flotsam and jetsam of industry. The docks, the factories and the workshops employed a great deal of unskilled labor. The out-of-work and the half employed naturally came here to be near what work was going. A familiar local phrase expressed the condition of most: "They were in and out of work regular." The population changed every three years.

Casual labor means low wages, and East London is the home of poverty. Many families there live in one or two rooms, many in basements; few families have a whole house to themselves. Commenting on just this phase, Will Crooks once remarked:

"Gough street, Poplar, where I live, is as good a street as is to be found within a radius of a mile. Yet I do not know a family, save my own, that has a whole house to itself, and I think I know every family in the street."

The houses in Gough street are not large; two-storied houses in pre-war days rented at $3.25 a week. But when $3.25 represents, as it did then, 33 per cent of a workingman's wages, he cannot afford that much for rent.

In Poplar the organized democratic movement is very strong, due chiefly to the leadership of Will Crooks. The Labor League, born at the dock gates where he held his meetings, was one of the pioneers of labor representation in England. Will Crooks has initiated efforts to improve the condition of the very poor, to humanize the workhouse, to care for the child and to protect the rights of labor. And what is of supreme importance, governments as well as people watched his work.

There are many stories being told now of the solid esteem in which Parliament has held him, but none is so typical of his patriotic character as the incident of some great moment in the Commons—perhaps the signing of peace. The house adjourned and was about to saunter away, when Crooks suddenly began the first bars of the national anthem. For a few seconds it hung in the balance, a few quavering notes, and then some sturdy voice joined him and all the rest came in like a choir, and the national anthem was lifted to the roof in a scene without an exact parallel in the history of the Commons.

Now Will Crooks will not sit in Parliament any more. He is a sick man. For thirty years he has served Poplar, and today Poplar stands at his door to serve him. His is a rare and exemplary life.

A Little Jewish Luncheon With John Spargo

Fearing to Confess, Unable to Deny What Most Jews Know, Jewish Leaders Turn the "Defense" Over to Gentile Hands

THE Jewish masses of the United States are thoroughly dissatisfied with the manner in which their leaders have attempted to meet the Jewish Question by evading it. But both the Jewish masses and their leaders are dissatisfied with the "defense" offered by non-Jews who, to win the favor of those whom they considered the most influential part of the community, or in response to certain inducements, became pro-Semitic propagandists of one sort or another.

The Jew knows when he is getting his money's worth; at least he knows when he is not getting his money's worth; hence his dissatisfaction with the work of the non-Jewish "defenders."

The appearance of the pro-Semitic propagandist on our soil, sometimes in the guise of a preacher, sometimes an editor, the cry common to all being that they are protecting "Americanism," is one of the strange developments of the time. For the most part they are sentimentalists who have not studied the Jewish Question for one half hour; without exception they are men who would move out of a neighborhood when the Jews began to move in; they would eschew hotels where the major patronage is that of Jews.

The Next Move Is Silence

THE DEARBORN INDEPENDENT, as a matter of curiosity, has examined the history of some of these non-Jewish "defenders" and has discovered this inconsistency in them. One clergyman, who has been most outspoken in his praise of the Jews and in his denunciation of all who make a study of the Jewish Question, has twice changed his residence because the neighborhood grew more and more Jewish, and has once removed his children from the public school because the school attendance was entirely Jewish. The reason for his "defense" lies in another direction. He loves and admires the Jews—from the comfortable precincts of his study in a non-Jewish quarter of the city.

Because the Jewish masses are not satisfied with the defense made by their leaders, and the leaders are not satisfied with the defense made by their non-Jewish conscripts, a new tack is about to be tried. The Jewish leaders are ready to adopt an attitude of very high dignity and let it appear that the American discussion of the Jewish Question is far beneath their notice. That is, having shrilled through the country ineffectually for eight months, they are now going to adopt the expedient of silence. It is a non-Jewish idea, by the way, and a very good one—if they can maintain it.

In the meantime, it will be made to appear that non-Jews (called "gentiles" or "goyim" (beasts) by the Jews) have taken the defense entirely out of the hands of the Jewish leaders, thus relieving the Jewish leaders of a state of evasion which must have become most painful.

The new strategy is the result of the exposures made by THE DEARBORN INDEPENDENT of the activities of the New York Kehillah in interfering with the religious and educational liberties of the American people. The investigation was one to which even the Jews could not object. They had announced in various ways that they were organized merely to protect Jewish rights. When knowledge was desired as to what the Jews believed their rights to be, it was sought in the official records of the acts of those organizations. That record has been spread before the readers of this series, and not a single item has been challenged by the Jewish leaders. They cannot challenge it, because it is from their own records.

Let the Gentiles Do the Work

THE dilemma which has faced the Jewish leaders all along is this—confession or denial. Their fear for their own position as leaders prevented confession; the fact that the statements made in this series have been based on Jewish authorities has made denial futile. It was still possible, however, to start back fires among the non-Jews, as was shown in the last article, but these fires do not promise to burn very long. The next resort is silence.

But it is a silence from which the masses of the Jews will probably rouse their leaders before long.

Silence, however, does not mean inactivity. Hardly. Boys selling THE DEARBORN INDEPENDENT on the street will still be slugged. Non-Jewish police departments will still be ordered to do illegal acts. Jewish influence will bring shame upon various cities by using political pressure to force through ordinances that even a shyster lawyer knows cannot stand. Jews who contribute largely to "churches" which call themselves "liberal Christian" but which are really liberal Judaism, will contrive to have rabbis speak from the pulpits. The whole sickening sordidness of the Jewish campaign of violence, suppression and fraud, will go on in the silence of the Jewish leaders.

And this is well, also. It simply gives each community the opportunity to see for itself, at close range, how this organized force works. It requires no imagination to see how much further it would go if it could. It dares, but as yet it cannot. And in the United States it never shall.

Now, one of the non-Jewish defenders who will be vigorously touted during the interim, although it is doubtful if his work has steam enough to travel very far, is Mr. John Spargo.

The first anxiety of Mr. Spargo throughout his pro-Semitic propaganda is to have all and sundry believe that he is acting entirely on his own, without the suggestion, knowledge or assistance of any Jew in the land. Mr. Spargo insists on that wherever he can.

When Mr. Spargo circulated the round-robin against "anti-Semitism" (but really, as the use made of it proved, against the THE DEARBORN INDEPENDENT) he had it announced through the always accommodating Associated Press—or was it the Hearst service?—that no Jew had put him up to do it, he just did it himself. This document was given two publications broadcast throughout the country, once in its original form, and again when Woodrow Wilson, whose administration was so marked by its Jewishness that it stands distinct, added his name. There is never any difficulty about getting pro-Semitic propaganda sent broadcast throughout the country over the wires of Mr. Hearst or the Associated Press.

And again when Mr. Spargo wrote a little book, a surprisingly little book for Mr. Spargo, he led off with a foreword in which he said.

> "This little book was written without the knowledge of any Jew. It is not a defense of the Jew. It is not a pro-Jewish argument."

In the January 29 issue of THE DEARBORN INDEPENDENT reference was made to a little meeting which Mr. John Spargo had with Jewish leaders in New York just before he sprang the manifesto against "anti-Semitism." Mr. Spargo was moved to deny this. In a letter to THE DEARBORN INDEPENDENT under date of January 31, he says:

> "I have never at any time in my life entered any 'secret consultation with a group of New York Jews,' or with any other group of Jews.
>
> "The protest against the propaganda of anti-Semitism, was conceived without consultation with any Jew, written without the knowledge of any Jew, and no Jew or group of Jews has any responsibility for it, direct or indirect."

The Spargo "Jewish" Luncheon

YET in a letter written from Boston, Massachusetts, to the New York *World*, and printed in that paper on February 7, Mr. Spargo tells a somewhat fuller story:

> "I have never attended any kind of conference or consultation of Jewish leaders, secret or open, large or small, in New York or elsewhere, in my life. The whole story is a senseless lie.
>
> "The protest against anti-Semitism was initiated by me without consultation with anyone either Jew or Christian. It was privately printed at my own expense, and submitted to many influential non-Jews before any person of Jewish birth or belief knew of its existence. After it was printed and was in private circulation, and had been signed by many representative men and women, I mentioned the matter to a few friends gathered in one of the downtown clubs. The circumstances were as follows:
>
> "A group of gentlemen, Christians and Jews, were lunching together and discussing the alleged predominance of Jews among the Russian Bolsheviki. Because of my interest in the subject, I was invited to join the party. A previous engagement making it impossible for me to be at the luncheon, I arranged to join the group after luncheon for as much of the conversation as the time at my disposal permitted. Those present were Mr. Melville E. Stone, of the Associated Press, Honorable Oscar S. Straus, Rabbi Wise, Mr. Jerome Landfield, of the American-Russian Chamber of Commerce, Mr. Louis Marshall and myself—three Jews and three Christians."

This is quite an extension of information concerning Mr. Spargo's pro-Jewish activities and about the meeting in question. There may be a little more information to be had, as for example, was another of the national Jewish leaders expected, and was a reason announced why he did not come?

Let us analyze the party. There is the general manager of the Associated Press, Melville E. Stone. He is an important personage, most important in the pro-Semitic propaganda scheme. It is over his nation-wide system of telegraph wires that the pro-Semitic news items now flooding the newspapers, are carried every day. It was there, in Mr. Stone's presence, that Mr. Spargo quite casually showed the protest, a few days before it also was sent broadcast telegraphically across the country. Mr. Stone was an important part of that conference—the Jewish Telegraph Service would vouch for that statement. Yet, as Mr. Spargo informs us, Mr. Stone is not a Jew.

There is also Jerome B. Landfield. What interests particularly about this gentleman is that he is a special writer (or was at a time) on the *Weekly Review*. That, of course, does not mean much to the general reader. There are many "liberal journals" sent out from New York which would mean much more to the general reader if he could see the list of those who are financing the publications.

A Non-Jew With Jewish Directors

NOW, in the case of the *Weekly Review*, the stockholders of a certain date included these gentlemen: Louis Marshall, head of the American Jewish Committee, Julius Rosenwald, Mortimer L. Schiff, Paul M. Warburg, and some other Jews not so well known to the public.

So, with the non-Jewish Mr. Stone whose Associated Press has not been entirely useless to the Jewish propagandists the world over, there is also Mr. Landfield of the *Weekly Review*. The mission of the *Weekly Review* seems to be the making of literary attacks on Bolshevism in such a way as to veil the fact of Bolshevism's Jewish character.

The other non-Jew, or "Christian," as Mr. Spargo prefers to describe his non-Jewish associates at the conference, was Mr. Spargo himself, and as to Mr. Spargo's absolute freedom from Jewish influence, his works speak louder than all his protests.

Now the Jews present were Rabbi Wise (who, by the way, has not yet brought that threatened lawsuit against Professor Hobbs); and Louis Marshall, whose leadership of American Jewry has so wofully failed; and Oscar S. Straus, who has served in a number of important Jewish capacities, not the least of them being as a member of the executive committee of the American Jewish Committee, which is an inside place of an inner organization at the top of organized Jewry.

The luncheon gathering, even considering Mr. Spargo's presence, takes on a decided pro-Semitic tinge, does it not? At any rate, it appears that only matters pertaining to the Jewish defense were taken up. Mr. Spargo showed his "protest" to the company; and they discussed "the alleged predominance of Jews among the Russian Bolsheviki."

In view of these statements of Mr. Spargo, to go no further, there is no reason to modify any former description of this meeting.

Nothing here said is in disparagement of Mr. Spargo's character as an honest man, for his letter to the New York *World* was the act of an honest man. He is not altogether happy in the rôle he has assumed; if he were, his book would have contained less of ill-suppressed bitterness. Mr. Spargo knows a number of things, but doubtless a few things which he knows are wrong. He dislikes anti-Semitism, and so does every sane man; he dislikes pro-Semitism also, but does not say so. He knows that anti-Semitism is never the original element, but that Semitism is, yet in his book he does not say so. He knows also that the one sure way of preventing anti-Semitism, is checking Semitism before it goes too far, but he does not say so. He knows that Americans can attempt to prevent the growth of Semitism to dangerous proportions, without being poisoned by anti-Semitism, but the book he wrote forbade him, by reason of its purpose, to say so. Mr. Spargo is in the wrong camp; he has left his tribe; he is not happy where he is. Let him attack anti-Semitism all he will, and show its source in Semitism, and he will have rendered a valuable contribution to the discussion.

Russian Bolshevism Still Jewish

MR. SPARGO does not know anything about the origin of the Protocols, but he has measured and weighed the fog which Jewish propagandists have thrown about those documents, and he writes quite entertainingly of the fog in his book. But he does claim to know something about Russian Bolshevism and he repeatedly denies that it is predominantly Jewish either in its personnel or its purpose.

It is rather late in the day to thresh over the Russian situation. In view of the fact that Bolshevism is the result of propaganda financed by Jewish money

from the United States and was heralded as a Jewish triumph at its beginning before its true and terrible nature was known to the world, in view of the fact that the Jewish radicals in the United States still claim the movement to have grown out of the aspirations of their people, and in view of the fact that the very latest information out of Russia shows no change in the Jewish political line-up, the facts are fixed. It may be granted Mr. Spargo that not every Jew in Russia is a Bolshevist, just as it is known that not every Jew in the United States stands for the suppression of a Free Press in spite of what the Anti-Defamation Jews are doing, but this does not minimize the main fact that Bolshevism was and continues to be distinctly Jewish in its leadership and official personnel. The Jews hardly deny this; they merely ask, "How do *you* know?"

The latest information from the countries surrounding Russia is that every purchasing commissar outside Russia, acting for the Soviet Government, is Jewish.

The latest information from inside Russia is to the effect that:

All political administration is in the hands of Jews, and is non-Russian.

There are still practically no Jews in the army upon the fighting line, the Jews of the army having charge of the commissary and other sections of the army back of the fighting line.

The reason the counter-revolutions have failed is that the peasants fear that they are a trick on the part of the Soviet Jews to gain the complete control they have always wished and failed to get over the agrarian population, who are now virtually the private owners of the so-called "nationalized" land.

That it is the Jewish influence in Soviet, from which Lenin and Krassin have tried to split away during the last six months, which is responsible for the idea of world revolution through Bolshevik propaganda in all lands.

American Bolshevism Also Jewish

THAT the Jews in power in Russia have conducted themselves with indescribable brutality toward the Russian population as if visiting upon them their hatred for the Czarist régime.

That the statement of Kameneff, during the deliberations of the Lithuanian peace treaty, still stands, namely, that Sovietism is maintained by Jewish brains, Chinese bayonets, and the stupidity of the Russian people.

It is not necessary, however, to go as far as Russia to see what group most energizes the Bolshevik idea. Indeed, it is not necessary to travel any farther than New York—not very far from the scene of Mr. Spargo's luncheon with "three Christians and three Jews."

If he will use his Jewish friends (provided they are willing) to look into the interlocking directorates of the Hebrew workers' unions of New York and the Communist party, he will see something which will convince him that it is not THE DEARBORN INDEPENDENT that menaces Americanism, but that which this paper is exposing.

He will find that the organizer for the Amalgamated Clothing Workers in New York is a member of the United Communist party.

He will find that Benjamin Schlessinger, president of the Ladies' Garment Workers of America, and B. Fineberg, secretary of the Jewish Forward Association, were at the office of one Charles Recht where was discussed the carrying on of Russian propaganda in the United States, and where the agreement was general that the safest way for the propaganda to be pushed was through the Jewish unions.

He will find that H. K. Herwitz, of the research department of the Amalgamated Clothing Workers of America, is also a member of the Communist party.

The One Big Union is the cover-name for this Bolshevik movement. The I. W. W. leader for the Russians in the United States is a Jew named Bluden, who is extremely active in the One Big Union movement, as is also Sam Balatin, Bob Paltner, and others.

The Jewish character of Bolshevism is demonstrable without leaving New York. There have recently been two large public meetings in New York, in which multitudes of Jews left no doubt of their Bolshevik allegiance, and at least one rabbi incurred their displeasure by preventing them from publicly recording that fact.

Is It Un-American to Warn America?

MR. SPARGO will not say, in response, that this information is dangerous to the American people, will he? Because if it is, there is danger ahead, for there are mountains of information on this subject. The American citizen will be inclined to think, however, that the danger exists only for those who are trying to foment revolution in the United States.

It is a pity that Mr. Spargo should find nothing but "pogroms" as the purpose of studies in the Jewish Question. Who will start them, does he think? The American people? Mr. Spargo has apparently overlooked that point. In his special pleading he has thrown over on his own people all the potential wickedness he can think of.

As to violence, if it should ever come, it will arise from the Jews. They believe in violence, if any deductions are to be drawn from their teaching and actions in this country. Out of a clear scene, without warning or cause, mobs of from 100 to 500 Jews have appeared on the streets of certain cities in the United States within the past 30 days to exhibit in every particular the brutality which has come to be associated with uprisings in Russia. As Rabbi Judah L. Magnes, head of the New York Kehillah, speaking of the revolutions in Austria, Germany and Russia, said: *"See what a large company of Jews was available for immediate service!"*

This technique of revolution, of street insurrections, of organized minority movements to give the impression of public disorder and widespread confusion, is actually taught in this country, and those who know most about it are Jewish leaders of the radical elements. They seek every occasion to practice the art which they are hopeful may one day be used on a large scale. In spite of Mr. Spargo's pretended indignation with THE DEARBORN INDEPENDENT, he would not himself undertake to get 500 Americans to attack two newsboys, and stage the play in six or ten American cities of the first class, would he? Why not? One of the reasons is that he could not get *Americans* to join in such a demonstration. The observation of these disorders, which are another timely exhibition not of Jewish power, but of Jewish *method,* shows them to have been instigated, managed and manned by Jews.

Now, in this manner it will be comparatively easy for local Jewish leaders, with the connivance of politically obligated non-Jewish officials, to stage something which they will label a "pogrom." They have already affixed the label "anti-Semitism" pretty promiscuously; the next thing in logical order is a "pogrom."

There is nothing the Jewish leaders in the United States would consider as more confirmatory of their contentions. It would be considered a godsend by them. And the records of history are not without evidence that, upon occasion, Jewish leaders have not hesitated to manufacture so-called "pogroms" to evade answering at the bar of public opinion.

Mr. Spargo is apparently anxious to defend Americanism. To that end he would do well to move farther from the camp of those who attack it. He is with the wrong crowd. Consciously or not, he is a tool. His chief service to the Jews, of course, is not anything he says in his book, but the fact that he is in the attitude of a "Gentile front." The impossibility of that position is that as soon as it is discovered, the occupant becomes useless to both parties.

What Mr. Spargo has failed to do in his book is the very thing he has often done in his mind, namely, ask himself the question, What is the cause of this scrutiny of the Jew? What is the situation out of which, in the United States, a new canvass of Jewish aims and methods has arisen?

He has asked himself that question, and he has doubtless got his answer, the only answer he could possibly have arrived at. But he has not given the answer in his book. In other words, Mr. Spargo has not touched even with the point of his pen the real problem of Jewishness in the United States. But, unless he is more firmly bound to his clients than his book admits, he will be forced by the very logic of the situation to come to it very soon. As a student, he cannot escape it.

The Truth Is Never Unfair

WE HAVE in the midst of the United States a people who proclaim among themselves that they are a separate nation, who say that in every war that is waged they fight for an alien country; a people whose very numbers are concealed; a people who have one statement for themselves and another for the public; a people who openly proclaim the right to make the United States Jewish; a people who advertise that they managed the recent war, and who boast that their race accounts for most of the millionaires whom that tragedy produced; a people who are not content with their American rights but seek Jewish rights to the injury of all that is traditional in American culture; a people who with execrable taste endeavor in season and out of season to utilize the diplomatic service of the United States to their own national ends; a people who are at this moment prostituting the whole consular service of the United States in the Balkan countries for dumping in this country, contrary to the regulations, people whose only claim to special privilege is that they are Jews—privileges and even rights which are rigidly denied other peoples applying at the same consulates; a people who have boasted in ten thousand copies of their private publications that they own the United States and will soon rule it; a people who have made, through their leaders, alliances with every possible revolutionary and disruptive force in the country; a people who, through their representatives, have seized the instruments of visual education to bring the people to a lower grade of moral taste than we have ever seen before; a people who would abolish the American Sunday; a people who demand as part of their "rights" the complete public concealment of every indication that the cultural and traditional caste of American life is Christian and not Jewish; a people who, en masse and through representatives, have demanded that the majority revolve about them as the controlling minority.

When Mr. Spargo says that it is cruel, unfair, cowardly, and so on, and so on, to stand up and look at these people, to identify them and to read their own statements of purpose, he is entitled to the right of revision whenever he wants it.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

The Crusader's Almanac, a Catholic publication interested in the maintenance of the holy places of Palestine, has several interesting bits of news from that land:

"The Zionists are preparing a new guide to Palestine in which everything Christian is ignored. It refers to the Holy Sepulchre as the 'Tomb of the Nazarene.'

"The nomination of Sir Herbert Samuel, an Israelite, as English High Commissioner of Palestine, has from the very beginning disquieted the Christian as well as the Mohammedan element of the Holy Land. The feeling caused by his nomination has grown in proportion with the activity displayed by him whom the Jews call the 'Prince of Israel.'

"On Saturday, July 4, Sir Herbert Samuel went in great ceremony to the grand synagogue in Jerusalem . . . . but even the Greek Patriarch who paid him the honors could not persuade him to enter into the Chapel of the Holy Sepulchre.

"Another surprise for the Christian and Mohammedan population was the recognition by the new commissioner of Saturday as a legal holiday, and then the decree that Hebrew was to be an official language of the government, together with English and Arabic.

"The Jews are coming to Jerusalem at the rate of several hundred a week. The most of them are emigrants from Russia and Poland, and are Bolsheviks. They try to buy up every available morsel of land, paying exorbitant prices in gold."

By order of the Palestine administration, a conference consisting of 71 rabbis and 35 Jewish laymen met in Jerusalem on February 25 last to elect a supreme rabbinate and a Jewish court of appeals for Palestine. Sir Herbert Samuel, the British high commissioner, in opening the conference, expressed the hope that the proceedings would help to bind more closely the scattered forces of Israel.

The first "Kosher ship" has been named the Mount Carroll. It is designed for third-class passenger service between Hamburg and New York.

Sir Alfred Mond, Zionist leader and British cabinet minister, on his recent return to London from Palestine said: "Palestine is a glorious state, suffering today from the results of centuries of neglect at the hands of the Turks. There is an immense amount of work to be done. The country has literally to be rebuilt. Work can and will be provided for three or four million men for years to come."

A Brooklyn Jew, requested by the American Jewish Committee to forward his war record, replied as follows: "I regret that I will be unable to give you this. I enlisted in the army as an American. The fact that I am a Hebrew is of no great import; I was no more important in the service than any American-born Pole, Hungarian, German or Swede. I will receive due credit as an American. In America, of all places, the Hebrew has the great opportunity of abandoning his Old World clannishness and becoming a true citizen of the land, and I cannot do anything which tends to keep him a separate people."

"It is quite some years since the writer visited an immigrant station and being always interested in Jewish immigrants, he took advantage of an invitation . . . . to Boston where immigrants are now landing in large numbers. During the past two weeks a dozen ships docked at that port. They carried about 15,000 Jewish immigrants, of whom only 25 have been detained."—Jewish *Daily News.*

The Hearst papers are now in the pro-Semitic program with all their might. After forgetting that February 28 was the anniversary of Rachel, the actress, who died in 1858, on March 22, the overdue article was printed: it gave the desired hook on which to hang more pro-Semitic propaganda.

Britain's Attempt to Solve Eastern Problems

By W. P. CROZIER

Manchester, England, April—(By Mail).

THERE was vague talk during the war that England meant to establish an "Empire of the Middle East" on the ruins of Turkey. That she should do so was in the imperialist tradition, which ordains that where a conquering power sets its foot, there it remains. And since it was tolerably clear from an early stage in the war that if Turkey was defeated at all, England would be the power to conquer and occupy Syria and Mesopotamia, there were grounds for supposing that in one way or another those countries would fall to England and from that her critics, and some of her friends too, sprang to the conclusion that out of them, perhaps with Egypt thrown in, she would fashion an "Empire" of the Middle East.

England's action with regard to Egypt gave a preliminary sanction to this view. Egypt had always in theory been independent. It never was, and is not now, in theory a part of the British Empire. However completely the British Government, through its agent-general at Cairo, directed the fortunes of Egypt, it was nevertheless the fact that England exercised no sovereignty there but had only acquired a specially privileged position for her agent. When Turkey came into the war, however, a change was promptly made. England did not annex Egypt, as many people expected that she would do, but she proclaimed a protectorate and of course she made energetic use of Egyptian resources during the war. As time went on, it seemed likely not only that Egypt would become in name as well as in practice a part of the Empire, but that Palestine and Mesopotamia also would fall into England's lap.

Nothing so crude, however, as bare annexations was in the minds of British statesmen, even had it been practicable and sanctioned by the public opinion of the world. There were several reasons why the creation of a Middle Eastern Empire comparable with the British Indian Empire was flatly impossible.

Can't Afford New Empires

1. The principles for which the Allies professed to have fought the war—freedom, liberty, the "self-determination" of people—had stirred up the East no less than the West to such a fervor that the East could not easily be held down by any imperialist power. This we have learned to our cost.

2. Thanks very largely to President Wilson it had become almost impossible for any power to annex outright a weaker people and its country. He established the theory of the mandatory or trustee state and although it is possible that some countries would like to transform a mandate into a mere cover for absolute ownership, we must maintain that the system of mandates can be faithfully carried out if public opinion will insist on it. That may be done either through the League of Nations or through an independent power like the United States, which has just exposed the difference between a mandatory area and annexation by demanding that equality of opportunity should be strictly maintained.

3. A matter of the pocket and the purse. We in England cannot afford any new empires. We are driven by sheer financial pressure to reduce our commitments wherever we can throughout the Middle East. People and newspapers in England whom Americans would suppose to be wild Imperialists, anxious at any cost to extend the empire, will be found nowadays criticizing the government severely for having made itself responsible for Mesopotamia and Palestine. Lord Derby, the Conservative peer, says he would "clear out" of Palestine and there is a whole school of politicians who want to leave upper Mesopotamia and withdraw right down to the head of the Persian Gulf, where we should remain in order to assure the safety of India.

These new principles might in themselves have prevented the establishment of a fresh "empire," but they were powerfully assisted by outside events.

Problem of Britain

1. The Egyptians, exasperated by an accumulation of grievances during the war and fired by what one may call in general the Wilsonian principles, broke into revolt, demanding independence. The Milner Commission was appointed to investigate. Its report, which is now before the cabinet, recommends that England should formally recognize the independence of Egypt, making a treaty of alliance with her but safeguarding in certain respects her own strategic position and the interests of all the foreign powers.

2. The Zionists, working with energy in the allied and associated countries and exerting all the influence of their very powerful membership (including that of some of the Rothschilds), succeeded in securing the promise of Palestine as a "national home" for the Jews under British protection.

3. The Arabs of Mesopotamia, discovering that they were being subjected to a great deal more of British administration than they had any stomach for, broke into widespread revolt. This led to an expensive and (in England) unpopular war, as a result of which the Arabs have promptly been given an administration of their own and are to be made, if possible, to defend and police their own country. There will be British advisers to the Mesopotamian Government but the British administration will disappear and the British Army will withdraw to the head of the Gulf.

These three points indicate the fundamental problem of the British Empire. On the side of the self-governing Dominions, that problem has been already solved. That is to say, they have grown to the status of complete self-governing nations, as free in all practical respects as England herself, and they have not desired to leave, or been driven from, the Empire because of any such criminal folly as led to the loss of the American colonies and the Declaration of Independence. Whatever the future may bring, the Dominions at present desire to remain as equal self-governing units within the Empire.

So, too, with the great eastern countries—India and Egypt—our problem is to lead them to the self-governing status without violent outbreaks and without endangering in some vital aspects our own position. We are bound to make concessions in Egypt and Mesopotamia, as elsewhere, to the principles for which the Allies fought. What we most need is not an Egypt that we can exploit for selfish purposes, but an Egypt that will be friendly to us and will not cut those communications to the East which we have ever in our mind.

Plan Likely of Adoption

IT IS not easy to devise a system under which Egypt shall have independence and at the same time we shall safeguard our strategic position. It is proposed that we should be allowed to keep an army in Egypt. This is clearly a rather large encroachment on independence, but it may be possible to devise an arrangement by which we shall have a garrison in the immediate neighborhood of the Suez Canal, which is what we desire to protect. The British Government has not yet accepted this scheme, but I believe that in essentials it will do so, and that, though Egypt does not belong to the Empire, this marks another step by which the Empire, responsive to the spirit of the times, may be able to survive without disruption.

In Palestine British motives are again a mixture of politics and strategy. The British acceptance of the Zionist program that Palestine should be declared a "national home" for the Jews was not mere sentiment in favor of the ancient race. The British have no particular need for Palestine in itself nor desire for it. As a mandatory area it would be expensive and troublesome if the British had to bear the burden. The Arabs and Jews make a difficult team to drive and the economic possibilities of the country are not greatly attractive. There is prestige, no doubt, to be acquired from the protection of the Holy Places, but that would fall to England even as a mandatory power.

England has, however, a strong strategic interest in Palestine. The Great War showed that the Sinai Desert is not the impregnable protection of the Suez Canal—England's artery to the East—that it had been supposed to be. The Palestine policy of the British Government satisfies three principles—the national aspirations of the Zionists, the necessity of defending British communications to the East, and the need for economy in expenditure.

Mesopotamia Is Different

THE Mesopotamian problem is somewhat different. After the armistice it seemed as though the British were going to install an Anglo-Indian administration without much respect to the wishes of the native Arab population. Whether this system was intended to be temporary or not, the Arabs developed a strong distaste for it and effectually insured its termination by breaking into a long and widespread revolt. The Arabs are now to have their own government (with British advisers)—some say under the Emir Feisul, whom the French drove out of Syria—and to police the country with their own militia. The mandate gives the British power to maintain troops in the country if they should think fit, but the British, who desire heartily to stop pouring out millions in Mesopotamia, hope to leave Mesopotamia to the Arabs in a political and military sense, and to withdraw their own forces far to the South, to the head of the Persian Gulf.

All this, it will be admitted, does not constitute a grandiose "Empire of the Middle East." My impression is that history will pronounce it to be a shrewd attempt to meet the difficulties of the British Empire, securing its strategic needs while involving a minimum of expense. At the same time something is done to satisfy the political aspiration of the native peoples, among whom the Arabs of Palestine, the prospective "national home" of the Jews, have perhaps the most ground for complaint.

The Tower Tree at Greensburg, Indiana

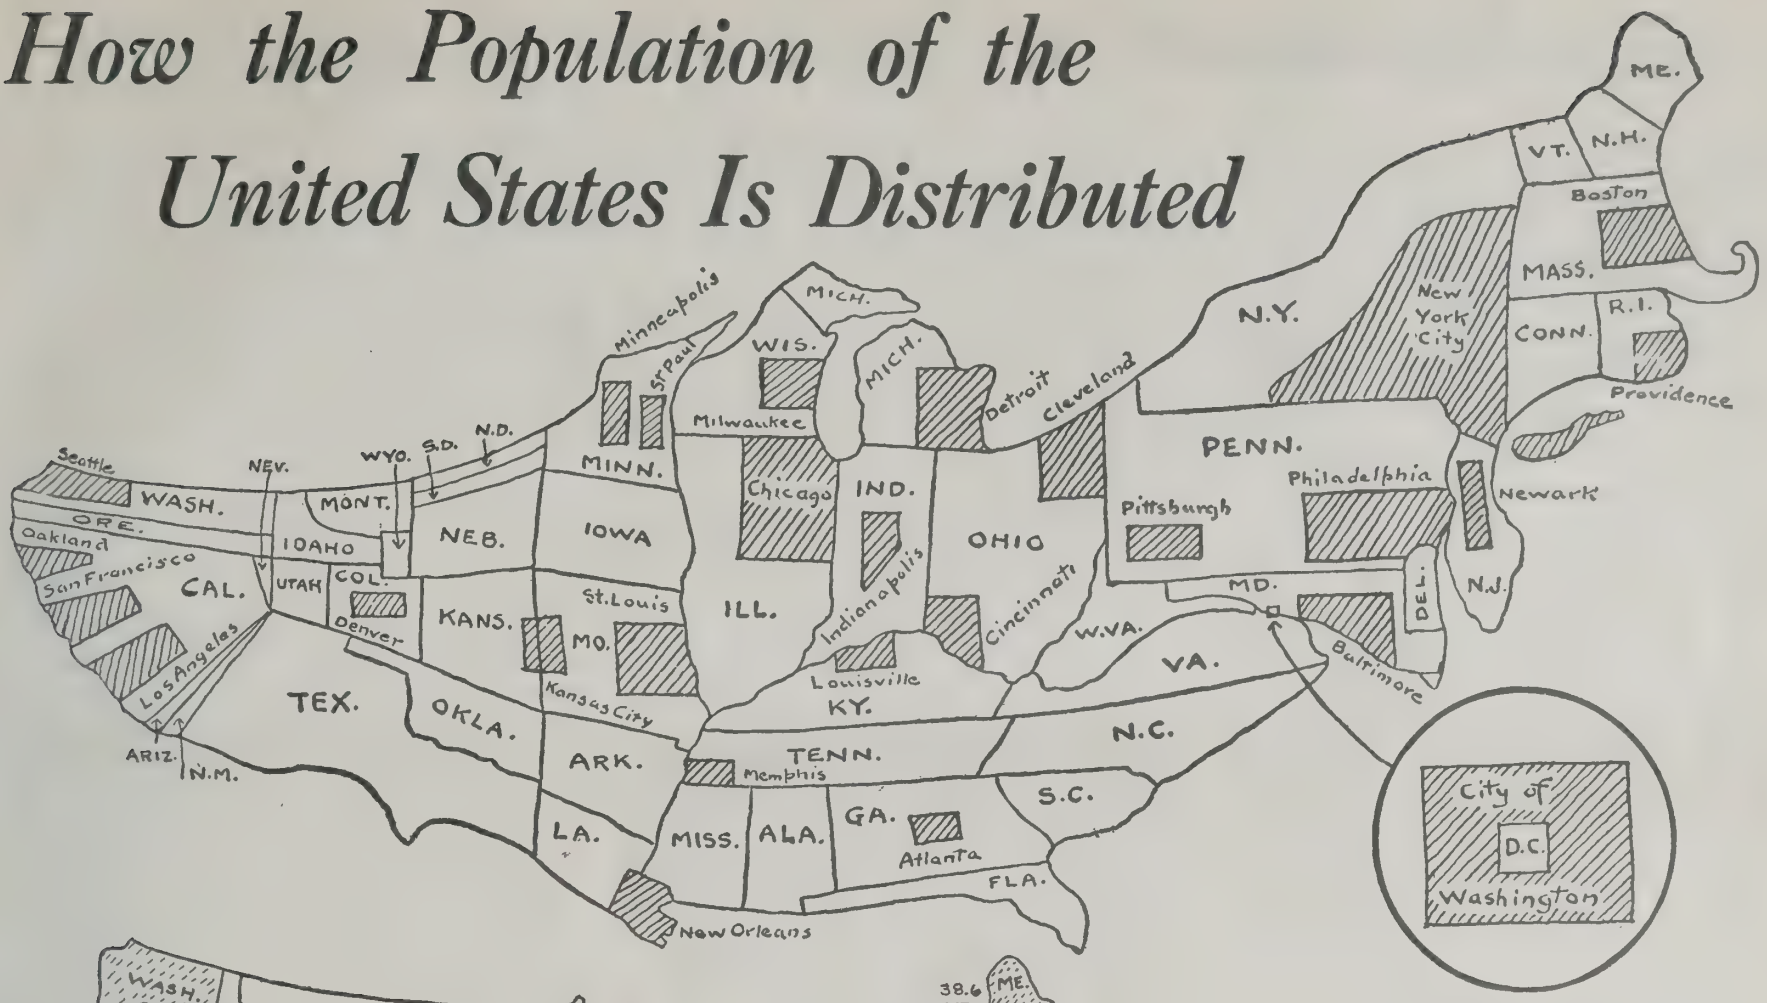
SOMETIMES the little triumphs over the mighty. David put a stone in a sling and slew a giant. A wee bird, unknown but not unsung, conspired with a tiny seed and conquered the cement tower of the Decatur County courthouse at Greensburg, Indiana; and the seed grew up into a maple that caused the place of its birth to be heralded far and wide as "The-Tree-on-the-Tower City."

Time passed; it has a way of doing that. The tree became the inspiration of J. Falconer Fraser, a Baptist minister. He turned poet and composer, wrote a song, and christened his effort "The Tree on the Tower." You may never have heard of this production; nevertheless it goes serenely on its way.

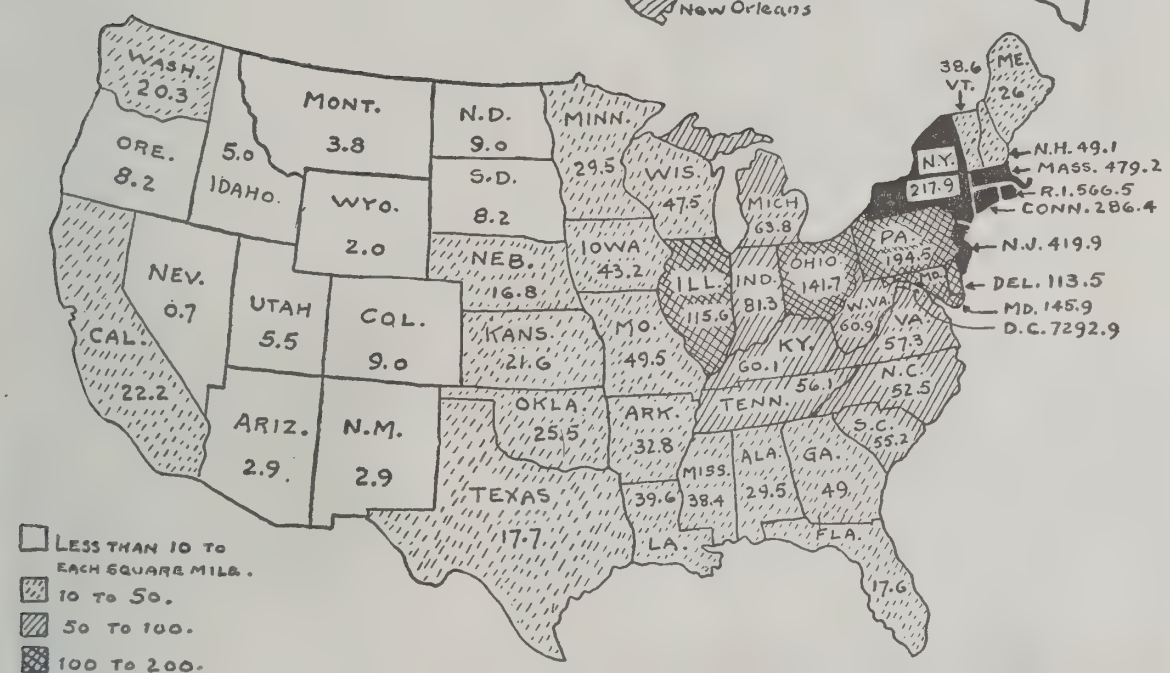
The Tower Tree is now nearly 20 feet high

"The tree," says Rev. Mr. Fraser, "is not a myth but an actual fact. It may be seen the year through, putting forth its leaves in the spring and shedding them as naturally as though its tangled roots were firmly fixed in old Mother Earth. The seed is supposed to have been planted there by a bird at a time before the tower was finished. The cement, being of a porous nature, holds enough moisture to sustain its life."

At one time no less than seven trees were growing on the tower. As the largest of these was threatening to wreck the roof in 1888, it became a question of saving the roof or the tree; so the largest tree was sacrificed. Since that date the others have died, all except the one on the northeast corner of the tower as shown in the picture.



"The first shoot," an old resident of Greensburg told me when I inquired concerning the history of the phenomenon, "was noticed about forty-seven years ago by a man who had bought a new spyglass and was trying it out on the courthouse to find how well he could see with it. Later other shoots were seen. At the time the courthouse was remodeled nearly thirty years ago, the first tree showed signs of decay and was removed. The stump of it, however, is still standing about a foot above the stone blocks which form the roof of the tower. The remaining tree is in a healthy condition."



At the present time the tree is approximately eighteen or twenty feet high and has a bole of five inches in diameter. It is little affected by summer droughts, and it remains green even when the ground-anchored trees in the courthouse yard show the effects of dry weather. The remarkable endurance, the sheer persistence of the tree, is almost an anomaly. How can it live? How can it grow? On the tower there is no soil.

Some years ago a scientist conducted an experiment to ascertain how a tree grows and on what it subsists. He took a willow that weighed five pounds and planted it in a large earthenware pot that contained two hundred pounds of soil. After five years he took the tree and the soil out of the pot and weighed each separately. He had watered the tree every day. How it had flourished! for the scales indicated one hundred and seventy pounds. There seemed to be as much soil as on the day that he planted the sprout, but the scales showed two ounces less. Evidently the tree had waxed large on a diet of air and water.

Now there is no soil in the Greensburg tower; yet the maple in a test of drought stands revealed as hardier than those trees in the courthouse yard. Why? When science can find the answer to this question of how a tree not only exists but grows on air and the water the cement blocks absorb, science will have added a bright feather to its cap.

How the Population of the United States Is Distributed

How the population is distributed. Numerals show the average density of each state.

Every bright school child, who has studied geography, will realize at once that there is something wrong about this map. The states are distorted in shape and size and the cities are out of all true proportion. In one respect, however, it is approximately correct. Thus would the map of the U. S. appear if the people were all distributed evenly at the average of 35.5 persons to each square mile, and if each state retained its present population. The cities would occupy areas equivalent to those shown and the national capital would overspread the District of Columbia 20 times.

Spots Where the People Are Crowded in, and Spaces Where They Are Few and Far Between

MUCH interest attaches to population figures. Cities boast of their size as measured by the count of dwellers therein and point with pride to the increase in number or percentage of their inhabitants. States also find gratification in those comparisons which effect their relative rank and standing. Merchants, manufacturers, distributors and advertisers consult such statistics to determine upon what sections of the country they shall concentrate their best efforts, and, of course, in this respect, a good showing in the census reports has a value similar to that of a good commercial rating. One attracts a volume of business; the other enables a credit with which to handle it to advantage.

But population alone does not tell the whole story. A state or a country may become too populous. Authorities differ as to what is a safe and comfortable density of population for a large country with fertile soil and extensive natural resources. Holland and Belgium were both prosperous before the World War. The former supports an average of more than 500 to each square mile, while the density of the latter approaches 600. In England the density is even greater, but the products of that country cannot maintain her people. In a sense England is not self-supporting. She must import food and other necessities, paying for them out of the earnings of her factories and her commercial activities. Clearly, then, this is a density too great for comfort or safety.

It would seem that in the United States there need be little immediate worry on that account, for here the average density of the country is thirty-five and one-half persons to each square mile. It would seem that we can develop greatly within the next few years without passing the danger point. To illustrate, let us consider one of the most evenly developed states. Indiana is still "rural," in the technical meaning of the term. That is, there is a small majority of her population on farms or in cities, towns and villages of less than 2,500 inhabitants. Though she has only one city in excess of 100,000, there are three that approach that size and will doubtless soon achieve the distinction they covet. Other goodly cities, industrial and commercial centers, enjoy a prosperity above the average and the farms of the state have the advantage of proximity to good markets as well as a topography that makes good roads easy of construction and maintenance. The United States could not be regarded as over-populated if its average development were that of Indiana. If it were, the population of the country would be 241,777,257.

On the other hand, were we to become as congested as Rhode Island there would be over one and a half billion Americans, who, however great might be their material prosperity, could not produce their own food and raiment and who would have to revolutionize their home-building methods to procure adequate shelter. Yet even Rhode Island is not so crowded as England, and it would, therefore, seem that we have room for great expansion, if only we develop our land reserves somewhat evenly.

	Area (sq. mile)	Population 1920	Average to Square Mile 1920	1910	1900	1890

But this seems to be particularly what we are determined not to do. The map which shows by different shadings and numerals the density of each state according to the 1920 census reveals a variation of from 0.7 in Nevada to 566.5 in Rhode Island. The accompanying table, which shows the density according to each of the three preceding enumerations, proves that the congested areas are becoming more and more congested. That this is entirely due to our urban drift is unmistakable. Massachusetts, with an area of 8,039 square miles, has seven cities larger than 100,000, any two of which would exceed her rural population. Rhode Island's rural population is only 15,217, scarcely more than one-fourth that of Nevada, where there is an average of only seven persons to each ten square miles. There are fewer farmers in New York than in Alabama, Georgia, Missouri, or North Carolina, and New York City is more populous than the rest of the state. Michigan and Ohio have evolved from rural states recently because of the abnormal growth of one or two industrial cities. In all of these cities housing conditions have all but reached the endurance point and living costs have mounted higher than in other less populous centers.

Something of the extent of this urban drift is illustrated by a second map—if map it can be called—by means of which an effort is made to show how the map of the United States would appear if the population of the country were actually evenly distributed at the national average, 35.5 to the square mile, and each state retained its present population. The larger cities are extended to cover areas equal to those they would then occupy. If the so-called "metropolitan areas," or unannexed suburbs of these cities, and all the cities in or near the 100,000 class were also shown, the result would be even more strikingly illustrative of the fact that our urban drift has gone beyond comfort, if it hasn't brought us to the verge of danger.

The map, of course, depicts an entirely fanciful and impossible arrangement, but it does illustrate, more or less graphically, a condition that actually exists and that is constantly becoming more acute. We have land reserves, advantageously located and wondrously productive, but of what use are they if they are not developed? What is the difference between a country that cannot and one that will not produce its necessities? We may be in no immediate danger, but how long can we, if present tendencies persist, remain a safe, a prosperous, and especially a well-fed people?

The Romance of the Sapphire

WHEN Jack falls in love with Jill and empties his purse for an engagement ring, he wants a diamond. He thinks nothing can be too good for his heart's choice. So with a kiss and a hug and an avowal of everlasting love he slips the ring on her dainty finger. To him the set is as genuine as his Jill, and it may be. But there are tricks in all trades, likewise profiteers; so the diamond may be merely make-believe, and just a sapphire.

Externally the diamond and the sapphire are much alike. In expensiveness, however, they differ tremendously. The two infallible tests consist of hardness and specific gravity, the diamond possessing a greater degree of each. Should Jack ever suspect that Jill's ring is a sapphire vicariously serving as a diamond, he can readily ascertain the truth and follow it up with a grimace or a contented smile, a grimace if he has been deceived, a smile if he has not.

That's about the only sort of a romance the poor sapphire can have nowadays. In the long ago, however, it played a noble part; and often, indeed, it was Cupid's aid. Did Jill get a bit of dust in one of her eyes? Jack would come a-running, grab up the eye-stone, and then apply it carefully to the injured organ. This action presented an excellent opportunity for love-making, for Jack would talk to Jill and Jill would talk back while the oval sapphire extracted the dust or grit, or failed to.

Why did the stone ever fail? There were many possible slips just as there were many recipes for its use. The advocates of the various methods could never agree. Some said the stone should be heated and wrapped in cloth; others said it should be heated but never wrapped. A few seers contended it should be washed before and also after use. But other seers averred the sapphire would not perform its work as an eye-stone if it were twice washed, once was sufficient; yet there were two camps of these, the before-users and the after-users. Altogether the poor eye-stone had a most miserable, abominable time while the philosophers and doctors thought up alibis for it, and painstakingly justified its existence.

Perhaps the most famous of these eye-stones was that in the Church of Old St. Paul's in London. In 1391 it had been given by "Richard de Preston, Citizen and Grocer of that city, for the cure of infirmities in the eyes of those thus afflicted who might resort to it." If rubbed on the eyes in cases of smallpox, it would preserve them from injury. Charles V of France possessed one of these valuable pieces; for in an inventory he noted "an oval Oriental Sapphire for touching the eyes, set in a band of gold." As late as 1648 it was said that if any one looked long and intently at a sapphire his eyes would be protected from all injury and that nothing harmful could befall them.

If Jack ever suspected his Jill and feared she was not true to him, he could test his sweetheart with a sapphire. Let her wear it next her breast and over her heart throughout three hours. If the stone took on a darker hue, poor Jack might know that his affections had been misplaced; on the other hand, if the gem showed no change, he would regard his Jill as immaculate. Jack's rival, the villain, would contrive whenever he could to have the test start at or about four o'clock in the afternoon. He had a very good reason; for he had penetrated the then unknown and discovered that the gem invariably appeared darker by the feeble light of candles and torches. And, of course, he always wanted Jill to be proved untrue so that he might have her as his very own.

These quaint people of the fourteenth century, of the Middle Ages, had the most unique ideas that you can imagine. They declared the sapphires themselves had romances, that the dark stones were gentleman sapphires and the lighter ones, those of pale blue approaching white, were the lady sapphires. The stones were endowed with sex; and occasionally, as in all worthy families, babies came, so it was believed. Certain supposedly honest souls would relate how they had domiciled two stones of opposite sex, and later been gratified by the discovery of a newcomer.

This curious belief prevailed many years longer than it should. Cardani, the Italian who was suspected of starving himself to death in order to fulfill a prediction he had made of his life's end, wrote in 1585 that precious stones were animate. He had never observed that they possessed sex although "as nature delights as much in miracle as we do, some may be so constituted that they are almost distinguished by sex." The statement reflects the uncertainty of that and the preceding periods on the activities of precious stones which we of today regard as inert.

The whole sapphire, besides strengthening sight, had a number of medicinal uses. Bartolomaeus Anglicus, teacher of theology in the University of Paris during the first half of the thirteenth century, recommended it as effective in stopping the flow of blood, especially nosebleed, by attaching it to the temples. He also considered it an excellent means of calming an excited heart and of checking excessive perspiration.

Robert Burton in his "Anatomy of Melancholy," published three hundred years ago, attributed to the gem a chastening, purifying influence upon the soul. "It is," he further avowed in that queer work, "the fairest of all precious stones of a sky color, and a great enemy to black choler, as it frees the mind and also mends the manners."

The Greeks dedicated the stone to Apollo and wore it when inquiring of the oracle at his shrine. To these ancients it was the sacred gem of gems. In the Bible it is said to be "as it were the body of heaven in its clearness." The Buddhists hold that it produces desire for prayer, that it gives spiritual light, and brings peace and happiness as long as the wearer leads a moral life. In short, of the vast array of colored gems the sapphire has been most venerated among all peoples.

Possessing the same color or hue as the sky, the stone has ever been regarded as symbolizing the heavens. It acquired a religious significance and became most appropriate as a setting for ecclestiastical rings. It was believed to maintain chastity, to counteract the wiles of the spirits of darkness, and to procure the aid of the spirits of light and wisdom. It also revealed fraud, protected the wearer from ailments, and gave him the power of concentration.

"The sapphire," said Saint Jerome in his exposition of the nineteenth chapter of Isaiah, "procures favor with princes, pacifies enemies, frees from enchantment, and obtains freedom from captivity. Thus if Jack were in prison and Jill could manage somehow to throw a sapphire through the bars and into his hands, Jack would presently be in her arms. Today a lot of folks besides lovers are wishing that the sapphire would regain its fabled power.

The "Star of India" in the Morgan-Tiffany collection of the American Museum of Natural History weighs 543 carats and is one of the finest asteria known. Though indefinite, its historic record covers three centuries of wanderings; but it is a safe guess that it will lie a long time in its present resting-place.

The sapphire, standing as it does for constancy, truth and virtue, makes an appropriate birthstone for the children of April. Indeed, it is said:

> If on your hand this stone you bind,
> You in Taurus born will find
> 'Twill cure diseases of the mind,
> The sapphire.

Your Own United States

Did you know that Columbus landed on soil that is now American? Here is a picture of a monument erected in honor of Columbus' landing near Aguadilla, Porto Rico, in 1493, on his first trip to the New World.

The Australian Blacks

Melbourne, Australia—(By Mail).

PERHAPS no race has ever existed upon this planet whose progress toward extinction has been so rapid as that of the blacks of Australia; and probably no race was ever known of so low a standard of mentality, customs and morals as the aboriginal inhabitants of this vast island continent. Their decimation, however, is not altogether attributable to natural causes, though these vastly predominate, and account mainly for the reduction of the native population; but unfortunately other reasons can be adduced which are most discreditable to the earlier periods of colonization in Australia.

There is this to be said in connection with the early settlement of Australia—that the pioneers of that movement had no such difficulties to contend with as those brave and adventurous spirits who went forth to reclaim the wildernesses of North America and South Africa. The Australian pioneers set out upon their long voyage to the other end of the earth with the knowledge that when they got there no hostile native population was to be encountered.

The Australian pioneers were allowed to land without the slightest molestation, and they might, if they had so chosen, have remained in unbroken friendly relations and intercourse with the aboriginal inhabitants of the country, and secured absolute possession of the whole of it without the sacrifice of a single life. But, finding the natives so little disposed to dispute the encroachments of the white man, advantage was taken of their complacent attitude, and the whites were not slow to show them that they were their masters in every way. The lack of intelligence displayed by the Australian blacks and their incapacity to appreciate the civilizing methods of the newcomers, impressed the latter with the uselessness of attempting any of those assimilating processes which had been brought to bear upon dark races in other lands. They soon grew to despise the Australian natives, and to treat them more like dogs than human beings. As settlement extended the cruelties increased, and the black man's life was esteemed at no higher value than that of a kangaroo or possum. Indeed, in Australia, and afterward in Van Diemen's land, the gun was used indiscriminately upon blacks and kangaroos, and a day's sport frequently consisted of a mixed destruction of man and animal. Some monsters even went further in this inhuman and devilish process of extermination, for it has been established beyond the possibility of successful contradiction that one of the practices often resorted to at the end of the eighteenth and far into the nineteenth century was to lay poisoned food in places where the natives were certain to find it.

What are the evidences of this process of unnatural extinction presented today? All that are left of the native race in the State of Victoria are gathered into two or three compounds of limited extent. In New South Wales a very marked decrease has taken place, and almost the same thing can be said of South Australia and of extensive areas in Queensland. They are to be found in greater numbers in Western Australia and the Northern Territory, where, as in the case of Northern and Western Queensland, climatic reasons have saved them from the rapid encroachments of white population.

In the adjoining island state of Tasmania (or Van Diemen's Land, as it was called in old convict days) where the aboriginal inhabitants were known to be pretty numerous at the beginning of the last century, neither man, woman nor child of them has been left. There the last survivor of his race has been dead for nearly half a century, and the black man's "coo-ee" no longer resounds through forests where thousands of aborigines roamed in undisturbed possession little more than a century ago. Just think of it! It took, from the period of earliest white colonization in Van Diemen's Land until the death of the last survivor, only three-quarters of a century to wipe a whole race out of existence! The record tells its own tale.

In Van Diemen's Land, as in Australia, the natives were remorselessly hunted down, the men murdered, and their women carried off; and the shameful record cannot be challenged that in 1830 an extraordinary attempt was made by Governor Arthur to catch and pen up in Tasman's Peninsula, with the ostensible object of transporting to Flinder's Island, the whole of the then aboriginal population of Van Diemen's Land. Upward of 3,500 whites, including thirty British soldiers, turned out for the exciting operation of clearing Van Diemen's Land of their presence by means of a cordon across the island. The brutal attempt proved a total failure. Only two natives were captured, and the cost of the expedition amounted to no less a sum than £35,000.

No reliable estimate has ever been made of the number of aborigines who inhabited Australia and Van Diemen's Land when the whites first took up their abode in these countries. The number in the whole of Australia has been set down at 3,000,000, and Governor Phillip estimated that in his time New South Wales contained 1,000,000.

One-Crop System of South on Its Last Legs

THE greatest reduction in acreage and production of cotton that the southern states have ever known will be put into effect this year. Cotton as King is to be uncrowned. The one-crop system of the states south of the Mason and Dixon line is on its last legs. Fields that for years and years have grown nothing but cotton are being sliced here and there to make way for corn, hay, pastures, truck gardens and orchards. Livestock and poultry are getting more attention. The cotton farmer is becoming a general farmer this year. From all indications the yield of cotton will be cut from 20 to 35 per cent. The greatest voluntary reduction of record was less than 15 per cent.

Cotton farmers are sick of cotton. The last year has given them a bitter lesson of depending upon it alone. They have seen the crop which they hold cost them from 30 to 35 cents a pound to produce drop below 15 cents a pound on the market. They have cotton on hand and cannot get rid of it. The world's supply of unspun cotton is sufficient to last for two years, some experts say, and the cotton farmer cannot hope for much improvement for months to come.

In other times, the cotton grower always has been able to sell his cotton or get some money on it. Now he can neither sell nor borrow on what he holds. Cotton no longer is a medium of exchange as it used to be. Time was when he could load a bale into the farm wagon, drive to town and return home with things to eat and wear, his cotton being accepted in lieu of money. The fact that it now is a drug at any price is what hurts most. And it is this fact that has contributed materially to the decision of the heretofore unregenerate that an all-cotton program this year will be ruinous.

Unlike the farmers of the northern agricultural sections, the cotton farmer cannot eat his product and he cannot feed it to the livestock. It must go through market channels or be stacked until those channels will take it. Mr. Cotton-grower, consequently, has been sitting at home with his cotton piled about him, with no meat in the smokehouse nor feed in the granary. Naturally, he is cotton-sick. It is no wonder that he is turning to something else—something that will at least help feed the family and the tenants and the cotton mules. It is a novel adventure for the great majority of farmers in the southern states. There are farms after farms in the cotton-growing region that produce no corn, no hay, no hogs nor cattle, no poultry, no garden truck, no fruits; farms without smokehouses, without granaries, without bins of potatoes and apples and without shelves of home-canned and home-cured things to eat.

It is not because these things cannot be produced that the southern farmers have not produced them. Cotton has been the one idol at whose shrine they have worshiped for generations. They have not tried—speaking in a general way—to raise anything else, this despite some agricultural advantages that other farming sections would prize most highly. There is the long growing season with the possibility of two or three crops in a single year; the long pasturage season and short, mild winters to make livestock production low in cost and consequently profitable; the absence of severe cold and snow with which the northern farmer must contend two or three months in the year; the early spring for products that bring the year's best prices on northern markets; the luxuriant growth of all kinds of grasses and legumes, and many other lesser advantages which are not common in the sections where general farming is practiced with most success.

In the face of such possibilities the southern farmer has kept on growing cotton. He has numerous excuses to offer. In the first place, he probably would say that his banker and his merchant would not give him credit if he did not grow a certain amount of cotton. He might add that he did not have the marketing facilities to take care of anything beside cotton. Or he might say that his labor did not know how to raise other things than cotton. Again he might say that, with a good cotton year, he could well afford to grow cotton and buy food and feed and other necessities in the open market. Such explanations are very common and are the ones most frequently heard.

Under the circumstances, it is quite natural that the merchants and the bankers want cotton produced when they extend credit. The agricultural experts have been telling the farmers all along, however, that if more of the necessities were produced at home there would be less need for so much credit. They have been pointing out for years to John Smith that if he will grow a bit more corn or hay than he needs, Will Brown, the neighboring farmer, will buy it because Brown always has bought such things. Brown is told the same thing and all the Smiths and Browns are informed of the trainload after trainload of meat and canned foods that are shipped into the southern states from the northern states.

The same experts have been telling the farmers that the labor problem will soon adjust itself to new farming methods and they point to the county agents and the demonstration agents and the greatly increasing number of agricultural high schools as sources of instructive information.

But the cotton farmer has insisted that, cotton conditions good, he can afford to buy his necessities. He has seen an acre of ground produce a bale of cotton which brought from $100 to $300 when the market was good. He has been willing to gamble on a good crop and a good market.

It was the high cotton prices near the close of the World War that contributed to the big lesson that southern farmers have learned—the lesson that is causing them to turn their backs on cotton this year. At planting time in 1920, cotton prices were very high. It looked like a big cotton year. Cotton went into every available acre of ground, even into the front lawns on many plantations. Before the bolls had started to form, prices started downward. Then they plunged downward. Cotton which, it is held, cost from 30 to 35 cents a pound to produce dropped to half that figure on the market and the bottom was not reached. It got to a point in the cotton-growing states where the product was a drug on the market. It could not be sold nor traded nor put up as security. For the first time in generations the cotton farmers were forced to stack their cotton to one side and start figuring how they could survive. The blow that had been dealt them was felt almost as keenly by business—by the banker and the merchants who held accounts that could not

Top—Eleven-day-old cow peas planted in August on a southern farm after a crop of wheat had been grown, cut and harvested from the same field the same year.

Center—Field of oats that yielded 125 bushels per acre, Washington County, Mississippi.

Bottom—Three tons of lespedeza or Japanese clover per acre, cut from a southern field the third week in August.

be paid. To produce more cotton this year with the world already supplied with enough to last two years would be folly. Something had to be done and done quickly.

"Diversify," came the old cry from the agricultural leaders. They had been preaching that gospel for 15 years, saw it taken up to an appreciable extent until the World War sent cotton prices skyward, and then saw it cast aside and forgotten.

Leading men of the South, bankers, merchants and planters, called a meeting to discuss the situation. It was held in Memphis, Tennessee, in December. It was there that the "Memphis Plan" of securing a reduction in the acreage and production of cotton was formulated. This plan is now being put into effect throughout the South.

In effect, the Memphis Plan provides for reducing the cotton yield 50 per cent by limiting cotton acreage to 33 1-3 per cent of the lands cultivated by southern farmers this year.

Attempts were made in other lean years in the cotton states to obtain lower production but these attempts usually were limited to the passing of resolutions declaring such reduction to be necessary. Many cotton farmers cut their cotton acreage but many others, it has been charged, took advantage of such occasions to grow more cotton than ever.

The Memphis meeting resulted in the passage of resolutions as other meetings had resulted. But "teeth" were given to the Memphis Plan. It says that credit shall be denied to those farmers who do not reduce their cotton acreage. The meeting went on record in these words:

"In view of the fact that the world cannot, or has not taken the present supply of cotton at living prices to the producer, it is hereby determined by this convention of farmers, bankers and merchants representing nearly every cotton-growing state, to reduce the cotton production for 1921 by at least 50 per cent of the production of 1920. This step we deem to be imperative as a measure of good business and financial safety. Any other course is speculative, and ruinous and unsound. Agriculture must obey the same economic laws as industry, and curtail production in times when production does not pay.

"In order that this 50 per cent may be equitably distributed, and in order that cotton production may be placed upon a sane economic basis, it is the conclusion of the convention that no farmer should plant to cotton during the coming year (1921) more than thirty-three and one-third (33 1-3) per cent of his lands under actual cultivation in 1921.

"To the end that this program may be carried out, appeal is made to the bankers of the South through their several state and county organizations and individually, to enforce compliance through credit restriction and by denial of credit, to any planter or farmer, or supply merchant, or landowner, who will not comply with the reduction plan aforesaid; the merchants shall be urged to restrict supply to those who will carry out said plan, and the farmers are urged to give said plan their sympathetic support."

The convention adopted resolutions bearing on the plans, one of these being as follows:

"We call upon the bankers and credit merchants throughout the states in which cotton is grown, to use their utmost endeavor to bring about the enforcement of a cotton acreage reduction by refusing to advance any money to anyone interested in farming of any kind, who in the first place, does not plant enough food and feed for his own use."

Immediately following the adoption of the Memphis Plan, steps were taken in southern states, and more particularly those of the Central South, to bring about the ends sought. Co-operation of the bankers and merchants has been general. The result is that cotton fields are being turned into corn fields and pastures and fields for other crops this year on a bigger scale than in the memory of the oldest inhabitants. The agricultural leaders, such as the county agents and the field workers for the government, the states and for the railroads and other industries that have thrown their weight behind the movement, have spared no energy in reaching the farmers with aid and instruction in the new sort of farming, realizing that proper planting and cultivation and proper knowledge of raising new crops and better livestock will mean fewer failures and a consequent interest and enthusiasm that will bear future fruit.

Some of the agricultural forces have issued pamphlets, widely circulated and published, which give emergency "cropping plans." These plans suggest what should be grown on farms of different sizes. As an example, the Arkansas Profitable Farming Bureau broadcasted plans which included one for a typical 40-acre farm having a team of mules, a cow, brood sow and pigs and two dozen hens. On this sized farm, the bureau suggests 14 acres of cotton planted in thoroughly prepared and well fertilized ground; 14 acres of corn with velvet beans interplanted; six acres of oats for hay, this to be cut when the grain is in the milk, and followed for a second crop with cow peas, lespedeza, soy beans or June corn; a half acre of sweet potatoes and a similar sized patch of Spanish peanuts which will provide food for the family and for fattening hogs; a quarter-acre of Irish potatoes which should be planted twice to get two crops in the same year; a quarter-acre of garden which can be planted three times for three full crops in most of the cotton states; one-fourth acre of sorghum for syrup and for feed, and four acres of pasture for mules, cow, hogs and chickens.

There are not many cotton plantations as small as 40 acres. Some of them exceed 1,000 acres and are divided up so that tenants take care of a small portion each. The emergency cropping plan outlined for a 1,000-acre plantation, the average of which has 50 tenant families and 50 head of cotton mules, provides for 475 acres of cotton, 300 acres of corn, 150 of oats to be followed by other crops: 25 acres of gardens and potatoes, and 50 acres of pasture. For 2,000-acre plantations, these figures would be doubled, and so on.

Such cropping plans are being followed with an unusual degree of sincerity on the part of both the small and the big farmers. The objective is to produce food and feed for home consumption and make the cotton crop the cash or profit crop.

It is admitted by the leaders that the yield this year may not be cut as much as 50 per cent, but they do believe that the reduction will be in excess of that of and other year in the cotton-growing states.

Show Boats on America's Inland Streams

By HENRI De QUESTIER

MORE show boats will range the Ohio River and its tributaries this spring and summer than ever before were afloat upon that stream. The majority of this craft will be motion picture theaters.

For today there is no more profitable show route in the United States than the 1,000-mile length of the Ohio River, and the hundreds of miles of navigable waters of the seventy-seven streams that empty into it. Compared with railroad rates that make overland transportation of shows almost an impossibility, the cost of carrying a show from river town to river landing is next to no expense at all.

All these show boats will do a tremendous business. The people who live along their route have plenty of money to spend. But that is only a minor reason for the scramble to get on the waterway this season. The owners of these shows are hoping to build reputations for furnishing good performances that will be assets when the river amusement business reaches the volume that it is expected to attain.

In the future this water show route will be much better than it is today, because of the nearness to completion of the canalization of the Ohio River. About one-half of a series of fifty-three locks and dams are in operation between its source and its mouth. When the remainder of them in course of construction are in operation a nine-foot stage will be maintained in the stream throughout the year.

Heretofore, the Ohio River has been a whimsical steam, afflicted with numerous and wide-apart variations in depth. They not only seriously interfered with navigation, but at times they brought it to a full stop for awhile—the channel could then be forded at a good many places above Cincinnati. Prospects for being on a permanently navigable thoroughfare have stimulated steamboating and business in every city and town along the river, and even at little landings, where there is nothing but a general store in the center of a group of three or four houses on the shore. And this stimulation has reached well up to the head of navigation on the tributaries.

As an illustration of the liveliness that is reflected in the number of show boats on the Ohio River this year, from one landing that is a smooth, unbroken stretch of sand with nothing upon it, 50,000 barrels of apples were shipped by steamboat to Cincinnati last fall. There will be more of them shipped from this landing in 1921. The average price received by the shippers for the apples was $7 a barrel, laid down on the sand where the steamboat could pick them up. The total production was grown on an area that took in not more than ten miles of the country back from the landing. Between seasons, when the orchards do not demand attention, timber is cut in the vicinity, and worked into the cooperage used in shipping the crops.

In former years, none of this work was done. The orchards were neglected. Comparatively few apples were shipped from this landing, because there was no dependable way to get the crop to market, except by wagons to the railroad a long distance away. When canalization was assured, however, the orchards were gone over, and their production is increasing. There is now a convenient and cheap way to market the crops by river when the demand for apples is heavy. And this seven times fifty thousand is the total number of new dollars that the people in this region have to spend that did not come to them before. They are inveterate show boat patrons—all of them, even to the far limits of this ten-mile area, and beyond it. Multiply this liveliness by a similar stir in all sorts of industries along the full length of the Ohio River and you have the dollars and cents reason for the influx of show boats on its surface.

In the water-soaked country of Louisiana, show boats return handsome profits. The craft range the country during fall and winter.

However, but few people who live away from the Ohio River—and a good many who live in the cities on its banks—are aware of this quickness in the river show business. They never even have heard of a show boat, though the craft have navigated the inland waterways of this country for so many years that no one knows when or how they started to do it. The Ohio River was the first breeder of show boats, and for well more than a quarter of a century they have been one of its important elements of traffic.

Despite these facts, in all that has been said and written about the fluid thoroughfare, you will find practically nothing about show boats. The craft has never been press agented, which is a peculiar statement to make about anything so spectacular as a traveling show. The reason is that show boats seldom stop in the larger cities along their route. People there do not patronize them to the extent that will warrant paying high municipal charges to tie to the water front, and to make parades. There are comparatively few towns on the Ohio River and its tributaries when the count of them is placed beside the number of landings on the stream. But there is a world of villages and clusters of three or four houses with well-settled country back of them on these water routes.

These small places have been intensively developed in the past as good "show towns." There is practically no expense attached to showing at their landings. Year after year, show boats have floated in and out of these more or less remote spots, almost to the exclusion of the larger places. Few disasters have occurred to attract newspaper attention to the craft; and all the other happenings to them take place where news seldom travels fifty miles from where it originates.

Consequently, few inlanders, even if they have heard of show boats, can visualize the craft, beyond the fact that they must be something that floats, and that whatever shape they have, they carry a show from river town to river landing. Well, that is what they do, plus something more. The performances always are held on board. There is no record of a water amusement enterprise that had a successful season where the performances were given in a tent or other structure on the shore. To people who live along these streams there is a glamour about the river, and the things that float upon it, that never is dimmed. Most of their joy in going to see a show is the opportunity to be aboard something that so essentially is a part of the waterway, and they will not patronize land shows to the extent that they will those whose performances are given on the water.

From the standpoint of the show-boat owners this attitude is very satisfactory. When the boats are set for a performance at the beginning of the season there is no need to disturb the arrangements until the close of the season, when the boat is overhauled and repainted for the succeeding season. That eliminates wagons, horses and workingmen who otherwise would be required to haul the tents and paraphernalia on shore; set them up; tear them down, and haul them back at night. There are no workingmen on a river show; only the crew demanded by Federal regulations for the steamboat that pushes it.

About the best idea you can get of a river show boat is to imagine yourself picking up a freak show from a street fair; or lifting your favorite theater or motion picture house, putting it down on the surface of the Ohio River, hitching a steamboat to it, if your choice is a theater—if it is a freak show, letting it drift with the current—and in that fashion float down the waterway, giving performances wherever you can drum up a crowd. The architecture of your craft will be the same, whatever variety of amusement you offer—a light draft barge, covered with a superstructure. Dimensions will vary according to the amount of money you have to spend on your boat.

Drifting with your freak show is emphasized, because show boats have no power of their own. And they belong in one or the other of two very distinct classes, the quacksalvers and the floating theaters. The former are hitched to no motive power. They float downstream, hand-steered by broad boards, nailed to the ends of long poles. Their season begins in the vicinity of headwaters early in the spring, and ends in the neighborhood of Cairo in the late autumn, unless they feel the urge to float down the Mississippi to the fantastic fluid routes through the swamp country of Louisiana. If they do not do this, they are towed to headwaters during the winter with any sort of a fleet going in that direction.

Attractions on the quacksalvers range from preserved whales to collections of gulf and sea fish, and from "Aztec mummies"—manufactured from papier-maché in North Cambridge, Massachusetts—to forlorn freaks, exhibited in a "pit," built on the order of a side show at a street fair. The boat is tied to a landing, and remains there as long as stragglers with some curiosity and a dime will wander aboard. There is no advance notice of the coming of the craft; and there is no "ballyhoo" to attract sight-seers.

A lurid banner is stretched across the shore side of the boat. A few small "heralds" announcing what there is to be seen are tacked to trees, and hung in the general store, at the landing. Everybody for miles around, however, soon knows that the quacksalver is at the landing, for nothing moves or stops on the river that isn't observed and talked about. The people who operate these freak shows are queer human documents in the record of inland waterways—mentally, they are as alert as a Coney Island side show spieler; physically, they are as inert as it is possible to be without entirely ceasing to function as a human being. They live in cabins built on the rear of their boats.

Floating theaters, also, are divided into two distinct classes, the theaters and the motion picture shows. The latter seat about two hundred persons and are towed by small gasoline boats. Electricity for the show and for illuminating purposes is generated on the gasoline boat. Their interiors are arranged precisely like those of any land motion picture theater. The living quarters for the owner and the crew and the people required to operate the show are in the rear of the theater. There is a small amount of advance work done by these shows—not many days ahead of the outfit. Then the advertising is confined to a few hand bills distributed at the general store at the landings, because the motion picture craft seek out the smaller places. They show there for one night, and go away with a slight profit. The principal advertising is done by a compressed air calliope when the craft arrives at the landing.

Floating theaters of the first class are towed by a steamboat. Usually it is large enough to quarter the performers and the musicians in about the same style as if they were put up at good hotels. Where the towboat is small, it quarters only the crew, and the performers and musicians live in rooms built on the theater boat.

The superstructure of a floating theater is a two-story affair, painted white and trimmed with aluminum paint to give the appearance of silver mountings. Large windows are left in the sides to provide ventilation. A gangway is built along its sides to give access to the rear when a performance is on, and it is impossible to go through the interior of the structure. The boat is heated by steam in cool weather; cooled by electric fans in hot weather; and it is lighted by electricity generated on the towboat. The outfit is steered from the roof of the theater. Lines are carried across the roof, and across the roof of the steamboat to the rudder. Signals to the engineer are given by whistles, and the lines to the whistles are carried back in the same manner.

At the front and rear ends the lower story is cut away to form a deck. The projecting upper story forms a canopy over these end decks, the forward canopy being a comfortable porch, and the rear canopy inclosing the kitchen and dining room. Behind the forward canopy are two medium-sized rooms on each side of a narrow hallway. They are the apartments of the proprietor or manager, who is a peculiar combination of showman and riverman. Beyond these rooms two or three others are built. They are occupied by performers and the pilot when the towboat is a small craft. Beyond these rooms is the balcony. There is no gallery on a floating theater.

Entrance to the theater is in the center of the front deck. At one side of the door is the ticket office; on the other side is the room of the star of the aggregation. A passageway between the ticket office and the star's room leads to the interior. From the passageway a flight of stairs leads to the balcony.

Except in decorations, there is no difference between the interior of a floating theater and a show house on land. The interior of the former is painted white, and there is no attempt to conceal the iron rods and braces that give stability to the structure. The seats are on an incline, and they begin near the door. The reserved seats occupy about half of the seating space. In the upper stretches of the Ohio, reserved seats pass under that name. Farther downstream there is a belt in which they are known as "set down seats," probably because they are insurance of a comfortable place in which to sit, and an unobstructed view of the show when the crowds overflow the seating capacity—which varies from 700 to 1,200—as is often the case.

The stage occupies the entire width of the theater at the rear end. The scenery is the work of skilled artists, and in variety it meets all of the requirements of any repertoire show, presenting dramas and comedies, or a show with a program made up entirely of

vaudeville. The dressing rooms face an open place behind the scenes. Most performers, however, prefer to dress in their own rooms.

River audiences prefer dramas with specialties between the acts, and a rollicking afterpiece, to any other program, and that is what they usually get. The plays presented are from the productions of the stock companies, and itinerant "ten-twent'-thirt's" that a few years ago flourished everywhere. However, the production that earned the most money for any floating theater proprietor was "Over the Hills to the Poorhouse," a weepy melodrama with a darkey comic relief.

And "Uncle Tom's Cabin" was presented for one season only to river audiences. In a way, the offering was appropriate. Not one, but many, Elizas did cross the river at Ripley, near Cincinnati, during the days of the Underground Railroad, and each time these fleeing women did it they had adventures that still are tradition in that neighborhood. The story was written on the hills at Cincinnati overlooking the Ohio River. But in the lower stretches of the stream the offering provoked a world of fights between the showmen and a sprinkling of town people who objected to it, because the Ohio in reality is the dividing line between the North and the South. These fights were so numerous that it was the custom just before the performance was over to loosen the lines that held the boats to the shore, and when the last straggler from the audience was clear of the gangplank the craft floated midstream, and was gone. In a good many places there wasn't time to release the lines before the fighting started, and these lines were cut by the crew when the wheel of the towboat made its first revolution to get under way. Many times the boats were followed by a shower of rocks and bullets. And because show boats usually make their way out of the Ohio into the Mississippi, and cruise through southern waters in the late autumn and early winter, "Uncle Tom's Cabin" was presented as far south as Baton Rouge, but that was the last place it was presented—the battle there was a classic in the annals of river shows. But the season was a profitable one, because thousands of persons on this route never had seen the play.

Show boat performers average up with the ordinary run of stock players. They are recruited from a good class of actors. Some of them never leave the river, while at the end of their winter land engagements other good performers "join out" with floating theaters as a pleasant way to spend the summer, and to improve themselves by study. There is plenty of time to do this, and it is one of the explanations for the general excellence of river shows, particularly the specialties. A good many vaudeville performers work out their notions for new acts and shape them up before river audiences during the summer. You will also find on any floating theater one or two really good actors, who for one reason or another stopped halfway up the hill of achievement on land, and dropped back to river shows, where life is easier, and engagements are never terminated for lack of business.

The same statement holds good with river show bands and orchestras. The music of a show, and its calliope, are nine-tenths of the advertising that is done, and it must be good. Even the rumor of a poor band and orchestra means the difference between profit and loss at a landing, because river bank dwellers have been taught to know and appreciate good music. If the calliope is an indifferent one, or poorly played, the show might as well be taken to some other landing before it opens its doors, for the attendance will be slim.

There is little advance work done. A few small "heralds," and a date line pasted on a barn or two at the landing a few days before the show is due is about all that you ever will see of it. And unless you go close to one of these indifferent stands of "paper" you never will know, unless you've seen them before, what it is about. In a good many instances there is no advance work at all.

Breakfast on a floating theater is served at 7 a. m. There is no excuse for non-appearance, except sickness. Discipline is rigid. There is no laxness in dress or deportment. There cannot be, because there is no place where you can do without your ambitions any easier than on a floating theater. Fines are levied for infractions of the regulations. The rule that is most cordially hated is the one that prohibits fishing from the boats.

Parade at ten o'clock is preceded by another calliope concert. Headed by the band, the men performers march up the landing, and parade the place, whether it has a dozen persons in it or a thousand. Whatever the population may be, there is a band concert on shore, with a program that is made up of standard and popular selections, with an instrumental or vocal soloist as the feature. While not more than six persons and a dozen dogs may listen to this concert, the smaller the crowd and the smaller the village, the more important it is that the concert be a good one, for the news of its merit will travel a long way before sunset, and

determine the size of the crowd. There are no matinees.

Parade over and done with, there is nothing to do until evening. After dinner the ambitious element among the performers and musicians practice, and the women sew. Others of the aggregation sit on the rear deck of the theater boat, or on board the towboat, and spin yarns or nap—and more often do neither. For there is something hypnotic about the river. You can sit for hours looking at it without a thought to disturb your quietude. If the town is large enough to offer attractions, the "troupers" stroll about it, but at mere landings it is seldom that any one goes ashore—there is nothing to be seen there.

The third calliope concert of the day begins a few minutes after six at the small landings. Before it is over the river bank is crowded, though the place may not have more than a dozen permanent residents. The crowd comes from the back country. When the calliope ceases to shriek, the band gives a concert on the roof of the theater, and follows it with a concert on the interior when the doors are opened.

In the larger places the concert begins a little later, and the crowd is more leisurely in coming to the river. The young people dance to the music of the calliope on the pavements up town, and they keep it up until the "steam piano" gives its sustained chord that is the wind-up of any music it furnishes.

The appearance of a floating theater at night is a revelation to the people who the year through never see a town that is larger than twenty-five hundred population. On the larger theaters boulevard lights are mounted on rows of standards bordering the roof. A powerful searchlight illuminates the landing from its top to the stage plank of the boat. The interior of the boat is garishly illuminated. And this display is appreciated—it is one of the few events in the year that will furnish something to talk about during the winter

Above, left—One of the largest floating theaters on the Ohio River. Above, right—Typical crowd on Bayou Teche, Louisiana, watching the arrival of a show boat. Below—This is a landing where thousands of barrels of apples are shipped out each fall, and show boats find it profitable to give their performances. At left—The only "paper" used by the floating theaters.

months. However, with the canalization of the Ohio River, and the heating of theater boats by steam, it is anticipated that next winter the craft will show these landings as many times during the year as they can do it at a profit. This is bringing amusement to people who otherwise would have none, except that of their own making, from autumn until spring.

How do these river crowds behave? Well, they are not unlike theater crowds at any other place. There are ruffians among them, to be sure, and these rowdies are looking for trouble from the minute their ears catch the first strains of the calliope in the morning. But they're whipped as soon as they offer sufficient provocation, and that much of the routine of a floating-theater day is out of the way.

Occasionally gangs will stand on shore and throw rocks through the windows. It's a dangerous pastime, for a floating-theater audience is made up of a large proportion of babies and children. Usually there is a constable at the landing, and where there isn't the gangs are taken care of by the showmen.

Once in a while, however, whole towns are involved in battles with the showmen through the antics of these gangs. At one river landing the trouble began when a gang shot out the lights during a performance. That brought on a panic that was hard to stop. When the audience was ashore, because some of the rowdies had been roughly handled their friends took up the fight, and their friends, in turn, joined them, until things were lively. Perhaps a hundred shots were fired at the boats by these town men before the lines could be cut, and the craft moved out of range. The curious part of the affair was that although most of the shots were aimed at the pilot, with the intention of killing him or crippling him so that he could not move the boats, not a window in the pilot house was broken, while the woodwork about them was pockmarked with bullet holes.

When autumn comes on, floating theaters leave the Ohio River, and make their way to the waters of the far South. Weeks are spent wandering from plantation to plantation, and when the show is in the lower coast country it is a mystery sometimes why people attend its performances, when you find plantations where even the darkeys speak only a patois, and attend a performance that is given in English. Late in the year the season is closed; the performers leave for their homes, and the boats shove their way upstream to Pittsburgh. Early in the spring their people reassemble; the Monongahela is followed to the head of navigation and back to the Ohio.

Briefly Told

President Harding has received a permanent pass to a chain of motion pictures in Washington. The pass is made of gold but under the law the war tax of ten per cent must be paid.

In Hungary service as a soldier at the front in the war is to receive recognition. The missing leg or empty sleeve will be a tax receipt, and bullet wounds will materially cut down tax assessments under new tax bills introduced in the Hungarian Parliament by the minister of finance.

Kansas had 87 public health centers for children in 1920, in which 9,930 cases were enrolled. They also cared for 1,500 prenatal cases.

The old battleship, Kearsarge, is being transformed into a floating-crane.

The Mexican Government has seized 3,700,000 acres from General Luis Terrazas because of the general's failure to live up to his contract which called for the division of the land into small tracts for the benefit of the peons.

Merely to obtain practice at climbing hand over hand, a fifteen-year-old boy ascended a suspension cable of Brooklyn Bridge with the skill of a sailor until he reached the tower three hundred feet above the water. Arraigned on a charge of disorderly conduct he was remanded to the children's court.

The Sociedade Brasileira Protectora dos Animaes is a Brazilian society recently organized to protect dumb beasts. It intends to combat vivisection, bullfighting, cock fights, canary fights and any other forms of cruelty to animals by publicly denouncing all offenders before prosecuting them.

A new steamer safe to contain valuables and registered mail is unsinkable. If cast overboard it floats about the sea ringing bells, shooting off skyrockets, flashing lights and blowing horns. Clockwork machinery, it is claimed, will operate it for more than a month.

Fairbanks, Alaska, is enjoying a real mining sensation. Gold running $5 a windlass bucket has been found on Cocomo Creek, within three miles of town.

The doors of Bryn Mawr College will be thrown open this summer to admit seventy poor girls and women industrial workers desirous of the "higher education." Everything provided for the comfort and convenience of the regular winter term students will be at the disposal of the scholar workers.

A gambling casino surpassing anything at Monte Carlo is to be built on an island in the beautiful bay of Rio de Janeiro. A modern ferry will be provided to make the run between the city and the resort.

The town of West Stockbridge, Massachusetts, is so healthful that no physician can be induced to settle there. The Selectmen are raising a special purse for a physician who will agree to live in the town.

The Prince of Wales is offering a reward of five pounds for the return of two old briar pipes he lost in his travels.

To supply the demand for "matadors" in Spanish bullfights, a school has been opened in Madrid by an expert. The pupils fight a dummy bull on wheels and operated by the instructor, and they must learn to avoid being "gored" by the rubber horns. But graduates must take real live animals before receiving their diplomas.

Approximately one-half of the population of the United States is of voting age.

For the first time since the day the United States declared war on Germany, the War and Navy Building has been opened to the public. Guides who relate true and near-true stories of documents in the library have begun negotiations for their reinstatement.

The municipal council of Paris has decided to place a memorial stone at each and every place where a "Big Bertha" bomb shell fell.

A new world record for parachute leaping was made recently when Lieutenant Arthur G. Hamilton dropped 24,600 feet at Champaign, Illinois.

An air flight to high altitude as prescribed by an Army physician resulted in restoring the power of speech to a former soldier, who for eight months had been unable to speak above a whisper.

Persons who believe they will be charged with evading the selective draft, but who did not actually do so, may escape the odium of being publicly branded as deserters unjustly by communicating all the facts of the case to Adjutant General Harris without delay.

The Mexican border at Matamoras has been closed to American hunters while Mexican soldiers are hunting down guerrilla rebel forces operating in that vicinity. The order states that any person found carrying firearms on Mexican soil be shot on sight by federal troops.

Madame Marie Curie, discoverer of radium, now visiting this country, was awarded the gold medal of the National Institute of Social Science recently. The award was made because of the great benefit of her discovery to humanity.

There is a movement among church associations of Pittsburgh to oust rent gougers from membership.

This month marks the sixty-ninth anniversary of the publication in book form of "Uncle Tom's Cabin." The story still lives on the speaking stage and in the cinema, as in literature.

Great Britain has perfected an entirely new type of seaplane which can either fly or cruise as a warship, so dispensing with airplane carriers.

America's Fastest Growing Weekly
Circulation This Week More Than 300,000 Copies

The American people are paying tribute to the one magazine in this country which has courage to print the truth—which is uninfluenced by the powerful interests that exercise such a tremendous pull on the newspapers and periodicals of the United States. Not only are we continuing the discussion which has aroused the entire country to the conditions which have been created by a highly-organized minority, but our plans call for the publication of further truth-telling, informative articles on subjects which for the most part heretofore have been denied the public.

Go Forth! and Greet the Spring!

HOW few go forth to meet and greet the Spring! She is here and settled with all her children before we are aware. It is long after her arrival that she gets as far as the factories and the offices, and by that time most of the first excitement of her coming is past.

How few go forth to meet and greet the Spring! But you cannot make that observation in the tone of one who says, "How few look up to see the stars!" Men are indifferent to the stars when blinded by the garish lights of a city night, but who is indifferent to the Spring? All would go forth to greet her if they could; all do who can. On a day that no calendar marks—for Spring is fickle in the keeping of dates—she comes; but for the most part men are busy in the cities, and though Spring has power to change the earth, she cannot work many wonders with city pavements.

If there were Spring holidays! If some new calendar maker should arrive and bless the earth with a new and popular and movable festival of Spring—movable according to the whim of the welcome maid! Some years the holidays would fall in April, in late and backward years in May; but every year, in honor of earth's arousal, a holiday long enough to liberate the people for a pilgrimage to wood and meadow.

The smell of the earth is at no time of the year so sweet as in Spring. The taste of the air and the feel of the wind on the face are luxuries that last in their perfection for only a little while.

There would be scouts sent out from the cities to report when the soil sent up anemones and violets, and when the sun on the moist earth began to stir the fragrance of the ground. Then cities would go out to greet the Spring. Spring fever would be no more; Spring joy would be an annual delight.

Cattle and Sheep Men in Despair Over Losses

Owe More to Banks on Stock Than Market Price for Animals

EIGHTY per cent of the live stock raisers of the West, the men who produce the meat for the nation, are potentially "broke." That is, if they were compelled to liquidate at present values of cattle they would be penniless, because their stocks and ranches, if sold or foreclosed on mortgage, will not repay the money they have borrowed on them. And the sheep raisers and wool growers of the West are in the same boat.

T. W. Tomlinson, of Denver, secretary of the National Live Stock Association, is authority for the statement about the cattle men. But one can find evidence of the truth about the cow men and the sheep men on every hand throughout the West. Many of them can't buy gasoline for their cars, while still others can't pay their garage bills.

Deflation and high freight rates are the immediate causes of the woes of the cow men. But previous to this they had to contend with a three-years' drought, which caused them heavy losses. Then came reconstruction, with the order of the Federal Reserve Board to deflate. The props fell out of the cattle market. Cattle men are naturally large borrowers of money, and they had borrowed on the high values of their stock. When cattle prices tumbled they were left high and dry, and that is where they are today.

It is useless for the banks to call their loans, because the cattle men can't pay; and if the banks should foreclose, what are they going to do with the cattle? They can't be marketed on an extensive scale at this time.

A little story of a big Texas ranchman is a good illustration of the present position of the cow man and the banker. This rancher owed his banker $280,000. When he obtained the money his ranch and cattle were worth perhaps double that sum. Eventually the banker notified the cow man that he would have to reduce the loan by one-half.

"Can't do it," said the cow man.

"We must have the $140,000," said the banker.

"All right," retorted the cow man. "Take my whole outfit and if you can get $140,000 for it, you're welcome to it."

The banker didn't take the outfit. That is just the situation all over the West.

The cattle and sheep men are not in the position of manufacturers, who can close their shops during a depression. They are in the position of a man hanging to a bear's tail. To let go would be far more disastrous than to hang on. Even if the stock men desire to sell out there are no buyers. Therefore, they are compelled to stick to the game and hope for the best.

Cattle and sheep associations of the various states of the West have been holding their annual conventions, and all have been doleful affairs. The cow and sheep men discuss their woes, relate their experiences, listen to speeches and suggestions designed to help solve their problems, adopt resolutions and adjourn. Meanwhile, the executives of the organizations are doing what they can in an effort to bring the industry out of its chaotic condition.

I attended the annual convention of the New Mexico Cattle & Horse Growers' Association in Albuquerque the last three days of March. These sessions were not unlike those held in other states, or unlike the national association convention in El Paso a couple of months ago. Some officers of the national association and a few members of other state organizations attended the New Mexico meeting, and told what their bodies hoped to accomplish. The "big five" packers were represented at the national meeting, and were unmercifully scored. They were accused of all sorts of things detrimental to the interests of the cattle raisers. The packers were not represented at the New Mexico meeting.

Western cattle like these were worth from $60 to $70 a head up to the time deflation began, now their market value is only about half that. The producer borrowed money on them at their higher value, and now he is potentially "broke."

The president of the New Mexico association opened the convention by declaring that one of the purposes of the gathering was to try to discover why the cow man can't get more than five or ten cents a pound for his cow on the hoof and must pay 50 cents a pound for a raw steak off the same cow or $1 for one pound, broiled, in a restaurant.

Some of the plans advocated by the cow men looking toward relief for their industry are:

Co-operative marketing, which would tend to stabilize the market, curb the commission man or eliminate him entirely, and have one fixed price for an entire day.

Reduced railroad rates on stock.

A protective tariff, which would keep out foreign frozen meats.

A change in the credit system.

Under the present plan of marketing, a producer may ship 3,000 head of cattle to Kansas City. A buyer there will say his firm wants only 1,000 head at the market price, say 10 cents a pound. The shipper will ask the buyer if he can't take another 1,000 head. The buyer says he will wire his firm. Soon he appears and says his firm wanted only 1,000 head, but it will take another 1,000 head at nine cents a pound. That leaves the shipper still with 1,000 head. The buyer agrees to wire again and ask his firm if it doesn't want the other 1,000 head. A little later the buyer goes to the shipper and tells him his firm will take the last 1,000 head at 8 cents a pound. There is nothing for the shipper to do but accept the reduced price, as he can't afford to hold and feed the stock at the stockyards. But when the market opens at 10 cents a pound, the cow man feels that he has a right to expect that this price will prevail all day. That is what he means when he says he wants one price for the entire day.

One crumb of comfort was handed the New Mexico cow men, and by the same token, it will be glad news to the stock men of the entire West. A traffic man of one of the big trans-continental railroads took the floor and announced that the 35 per cent increase in the cost of stock transportation, authorized in March, had been suspended until July 15. Even with this concession, the stock men say the rates are ruinous.

T. M. Rowe, attorney for the Texas & Southwestern Live Stock Association, composed of 5,500 members, attended the New Mexico convention, and paid his respects to the railroads. He recently returned from Washington, where he was in conference with the Interstate Commerce Board, relative to rates on live stock.

Mr. Rowe said that reduced railroad rates would go far toward remedying the present situation, not only in the live stock industry, but in other lines as well. He declared that the railroads may be justified in their present rates because of the high wages they are paying.

"But I think they are putting the cart before the horse," he said. "What they ought to do is to reduce their rates first and then reduce wages. If they follow that plan, the public would be with them. But they are going about it the other way. They boost rates first and want to tackle wages later. The result is that nobody is shipping goods who really doesn't have to, and earnings of the railroads will continue to drop as long as the lines follow that plan."

It has been claimed that the cow men during the war period made tremendous profits and lived accordingly. Some of them deny this. They assert they didn't make so much, because the wages of cowboys were doubled and that the price of everything needed on the ranch mounted proportionately.

On the other hand, a banker got right up at the meeting of New Mexican cattle men and told them they were traveling at too fast a pace when the money was rolling in.

"You bought high-priced speed wagons and you speculated in oil," he said, "and now you must go back to the old trail. The bankers will stand by you, but you must not borrow any more money than you absolutely need. In the end you are bound to come out all right, because a cow man never stays down."

Governor Merritt C. Mechem, of New Mexico, also addressed the convention, and he blamed the railroads for some of the present troubles of the cow men, but he said all in the industry were opposed to government ownership, as had been suggested. He said the stock men had a sample of government control of railroads during the war.

He mentioned the packers, but didn't criticize them.

"Whether there ever was a Philip D. Armour or a Gustavus Swift, we would have had big packers," he declared. "They simply had to come, along with the development of this country.

"Cattle and sheep-raising is a gamble, as I think every man in the business will admit," continued the governor, "which reminds me that I am being blamed for the recent passage of the drastic anti-gambling law in this state. To those people who don't like the law, I simply tell them that the stock-raising game is always open."

H. O. Bursum, who was named United States Senator from New Mexico to succeed Albert B. Fall, appointed Secretary of the Interior in President Harding's Cabinet, also is a stock man, and he was a speaker at the meeting.

He told the cow men the business is one of uncertainty.

"Today you may be riding in a limousine, tomorrow in a jitney and the next day you'll be looking for a job."

That about sums up the condition of many of the men in the industry.

During the convention in Albuquerque they told of a big cattle raiser who loaned money to ranchers. One could not pay when his note fell due and the former took over the outfit, moving 2,300 head of cattle to his own ranch.

Every sheep in New Mexico, and there are several millions, is mortgaged for $8, while the present market price is only $6 a head.

The second man who had borrowed from the big rancher saw the way things were going and went to him and said:

"I can't pay you what I owe, so go over and take my whole outfit; I'm going to get out of the country."

"I don't want your stock, I haven't any place to put it," said the prosperous one.

"Do what you like with it; I'm turning it over to you, to cover what I owe you," retorted the unfortunate one.

So the big rancher was compelled to take over all the stock on the smaller ranch, but he had no place for the cattle to graze. He leased grazing land in Wyoming, shipped the stock, and there it is today. He figures that he has $90 invested in each cow he had to ship to Wyoming. The present market price is around $30 or $35 per cow, which indicates the predicament he is in.

Mr. Tomlinson spoke before the New Mexico convention, saying that he had just come from Washington, where he had an audience with President Harding. He told the cow men that the President knows the condition the live stock industry is in at the present time and is keenly alive to the problems the producers are facing. He declared this explains why the Cabinet is so busy these days in considering plans for rehabilitating the industry. Mr. Tomlinson also told the cow men that there was no reasonable hope that an embargo will be placed on any commodity. The cow men had hoped some such action would be taken. Mr. Tomlinson told the cattle producers that the Federal Reserve Board was woefully wrong in its deflation plan.

The sheep raisers of New Mexico held their convention just prior to the cattle men. All had about the same stories to tell of how hard the wool and sheep market has been hit.

One man told of shipping a lot which was valued at $2,800 at the present market prices. After he had paid the freight on them to Chicago and other incidental expenses he had 32 cents left.

Another story was told of a sheep man trying to give a whole train load away without success. When the man to whom the sheep had been offered looked up the freight rate to Kansas City and his chances of disposing of the animals, he declined the gift. The sheep were an expense to the would-be giver, and he wanted to get rid of them.

The sheep men asserted that they didn't make big money during the war. They declared that the rag-pickers and junkmen of the East were the ones who profited, because they gathered rags from which shoddy clothing was made, while wool was allowed to remain in warehouses. The sheep men asserted, too, that even today it is almost impossible to buy an all-wool suit, even though the dealer says it is all wool.

For this reason the sheep men are greatly in favor of the French-Capper truth-in-fabric bill now pending in Congress. This bill provides that every garment made and offered for sale shall bear a stamp telling of just what the garment is made. If this bill becomes a law the buying public will know whether they are buying shoddy or wool.

This will help the sheep men, because wool that is now a drug on the market will have to go into clothing. The sheep men say the public wants wool, but cannot be sure of getting it under present conditions.

At both conventions the members were urged to sit tight, stick together and fight through organizations, for what they deemed a fair price for their product. The speakers said that while things were hazy now, the time is coming when there will be rifts in the clouds and the cow and sheep men will smile again.

But the cow men didn't get the answer to the problem of beef at less than 10 cents a pound on the hoof and 50 cents a pound raw, or $1 broiled.

To Save $200,000,000 Yearly on Forests

Louisiana Bond Issue Planned to Buy 12,725,000 Acres of Cut-Over Lands

Three-fifths of the primeval forests in the United States are gone. We must turn to the growing and harvesting of timber crops—Col. W. B. Greely, chief forester of the United States Government.

FOR some years—though it started too late to save billions of dollars' worth of the magnificent primeval forests of America—the idea has been growing in this country that lumber is a regular crop, just as much as wheat or corn or cotton or sugar; that it is a crop which requires replanting and scientific care, and that if forestry and reforestation do not receive the same study and attention from government and people that agriculture is being given, the day will arrive all too soon, when this nation will have to import all its lumber.

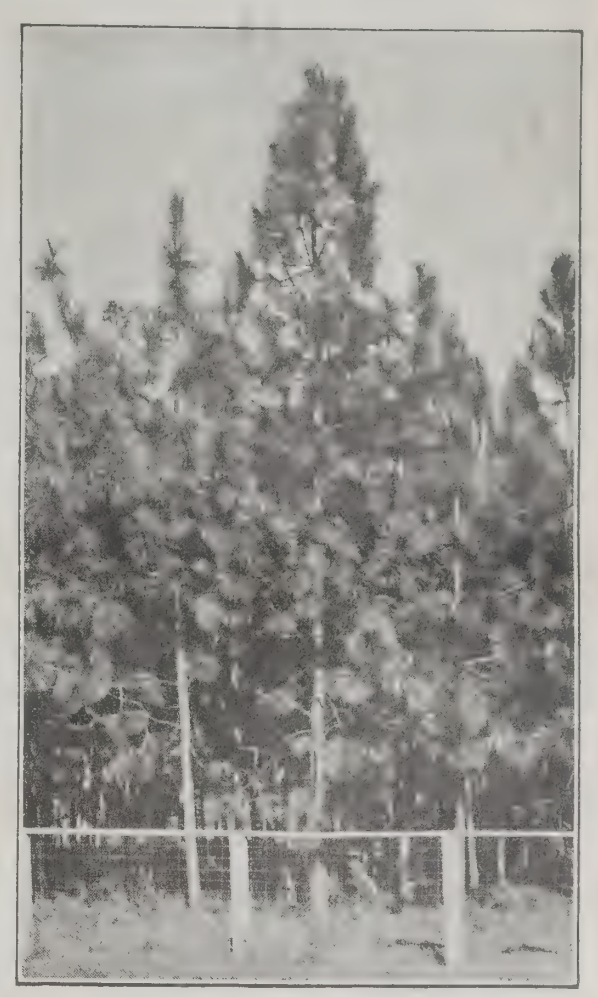
The states of the West, notably those of the Pacific Coast, came first to this realization, were the earliest to undertake the preservation of their standing forests and the reforestation of their denuded areas, and were the beginners in the noble science of making two trees grow where only one had been planted by nature. Yet it is out of the South, where men and state governments have been most wasteful of the natural resources of the land, that has come the most comprehensive, thorough-going and original project for the perpetual renewal of the forests of an entire state and the permanent preservation of the source of its output of incidental forestry products, such as naval stores, turpentine, rosin, and similar valuable and unreplacable commercial articles.

Louisiana has put up to the constitutional convention, now engaged in writing a new organic law—the ninth—for the commonwealth, a plan whereby every acre of cut-over lands in the state can be reforested without cost to state or people, through which the present timber crop, valued at $130,000,000 a year, can be made permanent, and in which is incorporated also the saving of all the trees from which every year approximately $75,000,000 worth of turpentine, rosin, pine oil and other by-products are taken. The ultimate object of this plan, which was devised by Henry Hardtner, the leading forestry student of the state, who has a large private forestry experiment farm at Urania, Louisiana, and by Professor William F. Polk, of Alexandria, Louisiana, is the purchase of every acre of cut-over land in the state and its reforestation by the state, under guidance of the forestry department of the Louisiana State Department of Conservation.

Governor John M. Parker and all his administration, the state conservation department, every lumber producing corporation and firm in Louisiana, and the officials of all the timbered parishes, are supporting the project. The first step outlined in the ordinance now being incorporated into the new state constitution comprehends the purchase of 400,000 acres of these cut-over lands, as the first unit of the new reforestation system. To buy these lands, the state is to issue $2,000,000 in "forestry bonds" paying three per cent interest and running for forty years. These bonds cannot be sold, and can be used for no other purpose than the purchase of cut-over lands for reforestation.

The bonds will be offered to owners of cut-over lands at par for the lands at the rate of $5 an acre, a trifle more than these undeveloped and uncropped cut-over lands are worth in the open market. In cases in which the owners refuse to sell these lands, the state is given the right to condemn and take them, provided they are not cultivated and have not been cultivated since the timber was removed from them. Since cut-over timber lands, especially pine lands, are of little value for agriculture until they have been fertilized, cultivated and cropped for about three years, there are few owners of these lands who would not be rather glad to get $5 an acre for them. The cut-over landowner who takes these bonds will get about fifteen cents an acre net annual income from the land represented in his bonds, instead of the nothing he was getting from the land, and, in addition, will have no taxes to pay on it, since it will have passed into the hands of the state. These idle cut-over lands today actually cost their owners from 20 to 25 cents an acre per year.

On taking over these lands, the state government, through the forestry section of the state department of conservation, immediately begins the replanting of every acre to the kind of trees which originally grew on the land. Foresters of the state estimate that, within 20 years, at the present rate of cutting of four billion feet a year, Louisiana's supply of standing timber will be exhausted. Within twenty years, however, by the method outlined in this plan, enough pulp-wood, fence posts and fuel wood will have been cut in the natural process of thinning out these reforested areas, to pay the interest on the "forestry bonds."



By the time the bonds mature, the timber on every acre of this reforested land will be worth, at the age of 35 to 40 years, at a low estimate $100 per acre, as it stands, uncut. This will pay for the land, by taking up all the bonds; pay several times over for the labor of reforestation and care, and will leave a surplus as a nucleus for future forestry bonds, so as to make the reforestation plan perpetually recurrent, until such time that the state is so thickly settled as to leave no room for forests, or a substitute for wood has been found. In this way, the state will have purchased, without a cent of cash outlay, virtually all the timber-bearing lands within its boundaries, and will have paid for them, as well as for all expenses connected with again clothing the state with forests, out of the products of these artificial groves.

Provision is made for the immediate issue of $2,000,000 in the bonds, sufficient for the purchase of 400,000 acres, but, as no limit is placed on the amount of bonds to be issued each year until all the lands are purchased, the Louisiana State Department of Conservation believes that it can plant and care for sufficient of these cut-over lands the second year to call for a bond issue of $4,000,000 for that twelve months, and for approximately $5,000,000 a year thereafter until all the uncultivated cut-over lands have been taken up. In other words, the department believes that, allowing for the issuance of bonds sufficient to purchase each year only such a quantity of cut-over lands as it can reforest and care for within that year, at the end of 14 to 15 years, it will have all these lands planted, and will be working right behind the lumber companies, replanting as rapidly as they denude the soil.

In preparation for this gigantic work of reforesting an entire state, the forestry board of the state department of conservation has issued a bulletin, "The Why and the How of Forestry in Louisiana," seeking to put the entire population of the state in touch with the plan and with the necessity of conserving and preserving the lumber supply of the state for all time to come.

Louisiana's forests today, according to this bulletin, are worth about $130,000,000 a year in lumber production alone, but in about 20 years, at the present rate of cutting, these forests will be destroyed, unless the people of the state stand solidly behind the forest conservation movement. The bulk of the work of saving this great state resource, it is pointed out, must be carried on by the forestry board, but nothing it can do will accomplish the desired effect, unless "the people of the state are actively in favor of, and work for, conservation of the standing timber, preservation of the growing young trees, and reforestation of tracts adapted to this purpose and not in use for other forms of agriculture." Fires alone are said to be responsible for the destruction of more than $375,000 worth of standing timber in this one state every year, while the failure of lumbermen to leave good seed trees standing in the areas from which they cut the timber is held to be responsible for the failure of the natural reforestation which would follow if one such tree were left in the middle of every acre cut over.

Further to aid in this work, the first summer forestry school ever held in the South will be opened at Bogalusa, Louisiana, in June, by the forestry department of Louisiana State University, aided by the forestry board of the state department of conservation. The course will last six weeks and will be open to men and boys only, with nominal tuition fees and with college credits given at the state university for work done. The school will be permanent and will be held in alternate years in the forests at Bogalusa and at Urania, each town being in the heart of heavily timbered sections of the state.

Properly planted for the farm wood lot. A growth of yellow pine, seven years old, planted on a Louisiana farm and now beginning to be ready for fuel supply or for fence posts and other small lumber. The reforestation campaign now being conducted among the boys of Louisiana seeks to cover the state with such reforested "back lots" as this.

Above—Monorail system for distributing lumber. Below—Fuel supply cut in thinning out reforested area, when trees are seven years old. This firewood and fence-post supply is expected to pay the interest on the "forestry" bonds Louisiana plans to issue.

Further than this, the state department of conservation, working with the state government, and with all the lumber companies of Louisiana, has offered a series of valuable prizes to the boys and girls of the state who will reforest each year areas ranging from one to ten acres.

Like the lumber industry, the turpentine and rosin (naval stores) production of Louisiana, now worth from $65,000,000 to $75,000,000 a year, is traveling at a rate which, as estimated by lumber and timber experts, will see the end of all turpentine and rosin-bearing pine trees in 20 years, or about the time the timber areas are denuded. These naval stores are taken from the pine trees by rough slashing, from which the sap, or crude turpentine, runs into clay or wooden or metal cups tacked to the tree below the slashing. The result of this "tapping" is that a tree which has been "turped" dies after about three years of giving up its sap.

Realizing that the good old free-and-easy American method of "using the tenderloin and throwing away the rest of the critter" had to go, modern naval stores interests have introduced the French method of "turping" trees in Florida, and now the state government of Louisiana, through the department of conservation, and backed by all the lumber and naval stores corporations, is putting in this method, officially, in all the pine lands of the state. It will extend the life of this industry, worth at the lowest estimate, $5,000,000, from about 20 years to a time when a fresh crop of pines, coming in on the state reforested lands will be ready to yield new crops of turpentine and rosin, and it will increase the life of each tapped pine tree from three to at least 50 years.

The difference between the French and American systems of tapping these trees is so slight that it seems remarkable no American naval stores producer had thought of it before American lumbermen and engineers went to Europe for the Great War. The American method consists of a broad, deep slash, made with a heavy, cleaver-shaped knife, about two feet from the ground, for the first year's drainage of the tree. The second year, the same size and kind of slash is made about thee feet higher, and the third year a third cut, still three feet higher. By this time, the tree is held to be drained of its turpentine, and is cut for the lower grades of timber, since a large part of the trunk already is dead.

By the French method, as brought back to the United States by the foresters of the Twentieth Engineers, there is no broad slashing, and no three-year unlimited drainage of the tree. Instead, up the length of the trunk, to the first branches, are cut long incisions, barely penetrating the bark, and not cutting the trunk of the tree beneath the bark. As the turpentine flows from these cuts, the tree's bark heals itself, the difference being the same as that in the healing of a scratch from a razor blade on a man's cheek and the healing of a blow from a hatchet in his arm or thigh. The trees in France are tapped by regular schedule. Rest periods are given each tree, and thus it is kept on producing for from 60 to 80 years, according to the report of Colonel W. B. Greely, chief forester of the United States Government.

The Mandates Don't Go

THE note in regard to the "mandates," addressed by Secretary Hughes to Great Britain, France, Italy and Japan, has the right ring. It is so luminously logical and so vigorously American that it should leave no doubt in the minds of either Americans or Europeans that the foreign policy of the United States is not lacking in backbone nor in brains. This without a trace of "big stick" belligerency.

Those who have followed the recent European attitude in regard to the United States must have been struck with its consistent disregard for American rights and American opinion. There has been something bordering on truculency in its assumption that our failure to ratify the Treaty of Versailles gave Britain, France and Japan a free hand to slice up the planet and hand out mandates without pretense of other consideration than their own selfish interests. The same game has been played to a large extent in the matter of the attempted imposition on Germany of indemnity terms, in which the outstanding feature is the requirement of a 12 per cent export tax to be handed over to the Allies and which would virtually transfer the German burden in large part to American consumers. This quite aside from a deliberate ignoring of American interest in world peace and economic stability, in fixing terms which every economist worthy of the name has declared to be impossible of collection, and then resorting precipitately to military measures for their attempted enforcement.

Now Secretary Hughes quietly and very distinctly and definitely reminds our recent comrades in arms that the United States surrendered no rights in the peace settlement by reason of its unwillingness to join the League of Nations. The United States is still one of the "principal Allied and Associated Powers," in favor of whom Germany, under the Treaty of Versailles, renounced all her rights and titles in her over-sea possessions, and Mr. Hughes points out that "a treaty to which the United States is not a party could not have affected those rights." As to the Japanese mandate in particular, Secretary Hughes makes the strong point that the United States not having entered into this convention, or into any treaty relating to the subject, it is manifest that there was no ground for conferring the mandate without the agreement of the United States, the League being "without any authority to bind the United States."

Altogether, the note is such a dignified and entirely proper assertion of American national self-respect as should jar the smug European assumption that we are to be fooled and browbeaten. And it suggests that an experience of a dozen years or so as a Justice of the Supreme Court may be a better preparation for the job of directing the nation's foreign relations than any amount of "diplomacy."

Helping the Farmer

IF THE farmer comes into his own, it will be a good thing not only for the farmer, but also for the merchant and the mechanic—for all of us. The hegira from the country to the city revealed by census returns has been felt in a vague way to be responsible in large measure for much of our present economic disturbance. There is an instinctive recognition that when the urban population of a nation exceeds that of the rural districts, an abnormal reversal of economic conditions is indicated. It is manifest that any considerable reduction of the number of food, wool and cotton producers with a corresponding increase in the consumption of these necessities means high prices.

It should not be less manifest that the abandonment of the farm for the factory, especially by young men, means that there is something radically wrong with the conditions of farm life and of farming as an industry. To hold the balance true between primary production from the soil and secondary production in manufactures, there should be approximate equality of profitableness and of attractiveness for the average man between the two classes of occupation.

The Federal Farm Loan Banks must prove an immensely valuable step in the direction of "evening up" the facilities of the farmer. On the technical side, the Federal Agricultural Department has proved its value in original scientific research work, as in stimulating interest in improved methods of tillage and disseminating important information.

But the worst drawback to agricultural progress and prosperity has been the farmers' dependence on middlemen for the distribution of agricultural products. It is cause for congratulation that the farmers themselves are waking up to the necessity of doing something more than growling in regard to this condition. Secretary Wallace, of the Department of Agriculture, has signalized his assumption of that post by an assurance that shows his appreciation of the need and his determination to help meet it. In a recent address at Chicago before the farmers' grain marketing committee, he declared that "There is just as much reason why the department should assist the farmer in developing methods of marketing his crops efficiently as that it should assist him in increasing his production."

Defective distribution is in itself a discouragement of production, especially when it results in prices to the ultimate consumer out of all proportion to those paid the producer. Improved distribution will prove beneficial all around.

China's Cry for Help

THE famine in Northern China faces humanity with a calamity which it would be difficult to parallel in piteousness or extent. It involves a population of 45 million people spread over an area of 575,000 square miles. More than 60 per cent of this population has been living in utter destitution for more than a year past; millions have already died and thousands are dying daily of starvation. Unless adequate relief is forthcoming, it is predicted that ten million people, most of them children of tender years, will starve to death during April and May.

It is fitting that, realizing the frightfulness of the emergency, almost the first act of President Harding should have been an appeal to the American people to give promptly and generously to the funds being raised to fight this famine. Here surely is the "one touch of nature" that "makes the whole world kin." We have been accustomed to thinking of China as far off and alien, perhaps. H. G. Wells in a recent article reminds us of the immensely important part played by improvement in transportation and communication when he suggests that 100 years ago it would have been easier to have governed California from Pekin than from Washington. This sense of distance bridged is reenforced by two contemporaneous events: one the President's approval of the consortium of American bankers for the financing of Chinese trade, and the other the announcement by the Department of Commerce that an American concern has made a contract with the Chinese Government for the erection at Shanghai of a wireless station larger than any now in existence.

"I shall never fully enjoy my loaf of bread," said Tolstoy, "until I know that no other human being on the planet suffers for lack of bread." Two dollars in Chinese money, about one dollar in ours, we are told, is sufficient to feed a Chinese adult for a month. This is about the price of an average business man's lunch. While the lunch we do without so as to give the price of it to feed these famine sufferers would probably do us more good than the lunch we eat ignoring them, it might also be possible that we would enjoy our lunch all the more if we made one of these little Chinese sufferers an "invisible guest." Not a single reader of THE DEARBORN INDEPENDENT will deny that the saving of a boy or girl from starving would be worth much more than the price of a lunch if it were his own child that hungered. Well, all these hungry ones are our own kin. Let us not wait for a typhus epidemic to remind us of the fact. He gives twice who gives quickly.

Two Ideas of Americanism

IT IS noted by a writer in the *Country Gentleman* that in the boisterous babel of selfish interests that smote the ambient air during the Congressional hearing on the Johnson Bill for the temporary suspension of immigration, it was difficult to catch a word spoken for Americans or from the American standpoint. There were special pleaders for every other nation and certain business interests, not noted for eagerness to maintain American standards of living among their workers, asked for endless concessions to immigrants from these nations. Representatives of transatlantic steamship companies pleaded for the continuance of the immigration flood. With steerage tickets at $125—all immigrants look good to steamship agents.

Among all these special pleaders, stands out one who as a corporation attorney and Jewish leader may be said to have discharged a double function. Ostensibly representing merely the American Jewish Society, Louis Marshall assured the committee that no harm can come to America from immigrants and that the Jews and Southeastern Europeans are no less assimilable than the English, Germans and Scandinavians.

"There is nothing sacrosanct in the English language," said Mr. Marshall. "It is perhaps well to have an official language in the United States, and English may be as good as any other for that purpose. But you can get your Americanism just as readily through any other language." And he went on to explain that Americanism was "merely a realization of certain ideal family relations."

Mr. Marshall's definition of Americanism calls for sharp challenge. It is far from accurate from the American viewpoint. With all due respect for the advocates of Yiddish, there *is* something sacrosanct about the use of the English language on the continent of North America. For the race that settled this land, conquered the wilderness and established in it the homes and industries of a nation of one hundred million freemen, the English language must ever be regarded as a precious heritage.

Our own history, especially our recent history, shows plainly that it is sheer nonsense to talk of assimilation among peoples that continue to speak different languages. The American farmer cannot be expected to explain in Yiddish to his hired man how to cultivate corn or prune apple trees. Out of difference in language it is easy for misunderstanding and antagonism to arise.

Americanism certainly includes realization of the family relation, and something more than medieval concepts of that relation. From these the Anglo-Celtic race has developed, especially on this continent, the town meeting, that democratic basis of our whole system of "government of the people, for the people and by the people." And this system is several thousand years beyond the patriarchal government of the Judean plains, so tenaciously held on to by the "People of the Book." The counterpart of the town-meeting idea in individual partnership in the affairs of government and the political responsibility of every man and woman, is far, far removed from the absolutism of the Talmud and the Ghetto.

Speaking of the recent stream of immigration to these shores, W. J. Carr, of the Department of State, tells us that from 85 to 90 per cent of these newcomers "lack any conception of patriotic or national spirit, and that the majority of this percentage is mentally incapable of acquiring it."

There is no place in American life for unassimilable aliens lacking conception of Americanism and "mentally and morally incapable of acquiring it."

Service That Serves

POSTMASTER-GENERAL HAYS is to be congratulated on a move which is plainly in the direction of placing the people's post office on a basis likely to serve the purpose for which it was created. In assuring post office employes of the fullest consideration for their rights and for the conditions of efficient and satisfactory service, he takes his helpers into his confidence and gives the public promise of much needed betterment.

Experimentation, having for its objective the making of this great government department a "paying business," has been the excuse in the past for stinting the workers, and other cheese-paring economies. Whether or not postal revenues will show an excess of receipts over expenses is a matter that should be made entirely incidental to maintaining a high standard of public service. If the postal service is to keep step with advancing needs and methods in the business world, earning a reputation for dependability and furthering rather than hampering the people's facilities for prompt and rapid communication, especially in the dissemination of knowledge, it will become a profitable institution in the best sense.

Mr. Ford's Page

GOVERNMENT never will be efficient through and through because that is not what Government exists for. But in its tasks, in the various things it undertakes to do as specific services for the people, it should be a model of efficiency. After all is said and done, Government is a business organization, and something more. In so far as it is the culmination of national purpose and aspiration, it is as foolish to require efficiency of a Government as of a poem. That is not the sphere of governmental efficiency. But if it is a matter of digging a canal, of surveying a road, of delivering a letter—if it is anything like the things men undertake in individual or lesser corporate capacity, then we have a right to expect of the Government a perfect performance.

These services, however, are but a part of the work of Government. They lie on the factory side of Government, so to speak, and should be organized under efficient superintendents who are held responsible for results. But there is a great region of policy and progress where efficiency, by the very nature of the case, cannot be maintained, but where wisdom is indispensable. Efficiency consists in doing in the best possible way anything which we already know how to do. But in the field of government there are some things which we have yet to learn how to do. We are still in the experimental stage.

Tariff is one of these experimental matters. Think of the many minds that have devoted themselves to this problem, of the party battles that have been waged over it, of the artificial prosperities and the needless distresses that have cursed whole populations as the tariff pendulum swung this way or that.

It would be most uncharitable to say that none of this effort to reach the basic principle of tariff has been honest; doubtless most of it has been; and doubtless the tariff idea rests largely on the confidence that a tariff is justified because it is serviceable to the people.

Perhaps there never will be a perfect tariff adjustment until the world itself is perfected, and then there will be no need of tariffs. It is because of the inequalities of the nations and the imperfection of the earthly federation that these walls are wanted. Formerly they walled each city apart from the rest; now they only wall each country.

It is all imperfect, of course, and tariffs are but a part of the general imperfection. We can perhaps tolerate them better for knowing that they are an effect more than a cause. Certainly the tendency of the times is toward less tariff restriction rather than more.

There was once a hope held by a party that the tariff problem could be solved on the principle of "tariff for revenue only," but if that rule were literally applied now, we probably should have the highest tariff wall in our history.

Tariff has always been relied on as a tax producer, and as a side line it served the industrial party—the greedy and short-sighted financial party—as a monopoly-maker. It is right to protect American industries when this does not mean protecting and coddling the greedy inefficiency of individual Americans. This country does not protect the individual that way; why should it protect a group of individuals formed into a corporation? If it is an American industry, it can meet the world. If it cannot meet the world, it should not be artificially sustained to represent American industry.

Taxation is another problem still in the experimental room of government. There never was an ideal tax because there never has been an ideal expenditure of taxes. There has never been a perfect basis of taxation because we have no basis of value. Many plans have been suggested to meet this lack. The single-taxer would make land the basis; others would take a certain percentage of the income. We try both after a fashion, and instead of people feeling that the tax is their contribution to the cost of the benefits they enjoy under their Government, they oftener feel that it is a burden. The very word has come to have an ugly sound.

The present administration must raise taxes, and of recent months most of the tax-producing sources have dried up. What happens then? What does the Government do then? Maybe the Government will go into production to earn its own money. We have 100,000,000 people here who never stop eating, who continue to wear clothes—it is a pretty good market and ought always to keep business pretty brisk, if there were not some kink in the money machinery which the Government says it controls.

It is easy to say, "Lower taxes." But to stop taxes altogether might mean to lower our Flag. How would you like a 50 per cent reduction in all your taxes? Well, that could easily happen, and still give the Government 40 per cent more than it is now receiving for the purposes of government, if we were not so dumbly tied up with a system that takes oceans of gold every year for the upkeep of our man-killing machinery.

If the tax system were even 50 per cent perfect; if people had a view of the course of their tax monies which should be half as clear as their view of the influence of their ballots—that is, if the people knew their government, or if the facts of government were such as would make the government desirous of having the people know them; then the payment of taxes would become a pleasant ceremonial, like unfurling the Flag or firing off firecrackers on the Fourth of July. Taxes provide the method by which people enter most closely into the work of Government, yet nobody knows it. Fundamentally there is a wrong, wrong principle.

Then, there is Transportation—that also is still an experiment. Nothing is more arresting than the service breakdown of the railways five years ago under increasing business, and their fiscal breakdown now under increasing income. When more business breaks a business, and more income renders it poorer, there's something deeper than mere mismanagement, there is something fundamentally wrong.

Of course, fiscally, our railroads are paying for multitudes of dead horses. Gamblers first controlled our railroads, robbed them till there was no more gamble in them, and left it to honest management to pay the I O U's. Railroads developed artificially because their gambling controllers strangled the railroad's side partner, the canal—the canal, which, had it been left alone to perform its functions, would have assisted the railroad to grow on a more natural basis. But, no, the gamblers filled the canals with rubbish, and today the railroads are breaking down for lack of waterways to help them.

Our railroads are striking illustrations of the retribution which overtakes even a national and international business which is victimized by speculation. By being regarded as mere financial devices, railroads were cheated of the mechanical development which today would have enabled them to meet the changed conditions. Worse than being inefficient, worse than being near bankruptcy, our railroads are not admirable even in the railroad sense. They are equipped wrongly and operated wrongly and they never will be efficient and they never will be profitable again until they have been changed from the bottom. You can't run railroads from a speculator's office.

There, then, are three problems, all of them touching our times pretty vitally—Tariff, Taxes, Transportation. Each of them a field for dreams that come true.

TO KNOW the proper balance between income and outgo—that is the problem of Tariff. To know the proper balance between service and cost—that is the problem of Taxes. These, with Transportation, constitute three of our big experimental problems. When Tariffs are a barrier instead of a gate; when Taxes are a burden instead of a privilege, there is something wrong, not in the method, but in the apprehension of the very principles involved. Transportation business grows weaker the more business it gets; its profits grow smaller the more income it receives; something else fundamentally wrong. This is a day for Dreamers Whose Dreams Come True. There are plenty of problems to solve which can only be solved by the Idea.

Texan's Magic Has Brought Beauty to City

SAN ANTONIO was a wide-open town and J. R. Lambert one of her best-known barkeeps. Situated within 150 miles of the Mexican border, within easy access of the vast stretches of plains and prairies where wandered countless herds of Texas long and shorthorns, San Antonio drew to her bosom the sons of the wide and wild stretches. Here they came to take a chance at faro or the cards and drink whisky straight. In the midst of this oasis was J. R. Lambert's saloon and he stood behind the bar and served the spirit-loving throngs.

Before he became a barkeep Lambert was a stone mason. He saved his money and finally accumulated enough cash to buy the saloon. Like many of his kind in those days Lambert also became interested in politics. Politics and the saloon were bed-mates before the Eighteenth Amendment went into effect. Lambert developed into a good politician. His power became felt in local elections. He was a man to be reckoned with in any local issue that was decided at the polls. His saloon grew more and more prominent as Lambert extended his political power.

There came a mayoralty campaign in San Antonio. It was a bitter contest and after the votes were counted Lambert's candidate was declared the winner. And then Lambert, who had exacted no political reward before, demanded one. He insisted on being appointed commissioner of parks and plazas of the city of San Antonio. Since the mayor was morally bound to give Lambert any political appointment he demanded, because of his services at the polls, he had to comply. This he did reluctantly. There was much protesting, much agitation, much denouncing. Giving a job like commissioner of parks and plazas to a saloonkeeper was preposterous. Much in the way of political graft had probably been attempted in San Antonio but this was too bold, too brazen, too horrid. The public wrath grew, the flame of public indignation swelled and the mayor was denounced along with Lambert. But the mayor was firm and Lambert kept his peace. The tumult subsided as such tumults always do. Lambert sold his saloon and settled himself in a downstairs corner of the city hall and went to work.

Today J. Raymond Lambert, or Ray Lambert, is the biggest man, as far as could be learned in one month's time, in San Antonio. Forty-six parks and plazas within the city limits testify to his greatness. In the opinion of the writer he is the most efficient city official in the country today.

Lambert has been commissioner of parks and plazas of San Antonio for a number of years and he will probably be able to continue as commissioner just as long as he cares to. During all this time he has worked with two honest aims, to do all the work within his power, regardless of time, energy, personal hardships and self-denials and to save as much money for the public as possible. In both he has been brilliantly successful.

San Antonio has her Missions and her Alamo, "the cradle of Texas liberty." San Antonio has her old churches, a wonderful country club and beautiful residential sections, but if you ask the average San Antonian what point he considers of most importance and interest he will answer immediately, "Brackenridge Park. Have you seen the Japanese Gardens out there?"

Brackenridge Park is the palace ground of San Antonio's 46 parks and plazas, and the sunken Japanese Gardens the palace. Of the 592 acres that are included in the park and plaza allotments, Brackenridge covers 305. Brackenridge Park is big and complete, a remarkable city playground, but the Japanese Gardens lift it to fame and the history of the gardens shows the creative genius of Lambert.

When Lambert became commissioner of parks and plazas, Brackenridge Park was little more than a large tract of waste land. It had few possibilities. Many landscape gardeners would have passed it up. Some of these experts said it would never do as a park. It contained an abandoned stone quarry and a garbage incinerating plant, also abandoned. It presented a dismal aspect. Not only was a large portion of it an eyesore, but most repulsive.

Lambert gathered his laborers and got busy. He dismantled the garbage plant and tore it down. He saved every part of it, stone and all. The tall chimney he allowed to stand. After everything was piled up neatly he sent his army of laborers into the stone quarry and hauled out all the loose stone that remained. The quarry cleared he began building and after much hard work the Japanese Gardens were created and the disgusting eyesore became a thing of unparalleled beauty in the way of landscape gardening.

In this garden are Japanese houses built of stone, lily ponds and flower beds, rustic Japanese bridges and tropical foliage. There are fish ponds and shaded nooks. Stone steps wind down into the gardens and the gardens are spotted with the same kind of steps and benches.

The stone house, the large one, was built of the loose stones picked up in the quarry. They also served for the steps and the benches. The stones, now fast, line the lily ponds, and the quaint fish ponds with their rare goldfish were made from the dilapidated vats found in the incinerating plant. The roof of the big house is made of thatched palm leaves. There are many palm trees in San Antonio. You find them in all the parks and plazas. Lambert had his men collect them and, instead of destroying them, they were hauled to the Japanese Gardens where they served for roofing. It is said that the only expense of this garden, outside of labor, was for wire used in attaching the palm leaves. And the quaint-looking steeple at one edge of the garden, the one covered with vines and looking so artistic from this distance? Why, that was the chimney of the incinerating plant, the only part of the plant that Lambert left standing when he dismantled the building. At night the gardens are lighted with thousands of globes and to view this spot from a place that

J. R. LAMBERT, and the ornamental lighting posts he is constructing for San Antonio from waste.

was once the edge of the stone quarry, gives a sight that will long be remembered.

It was a large stone quarry and after creating the Japanese Gardens, Lambert discovered he still had a lot of territory to convert, so he constructed a Mexican Village. This is a masterful creation but it will never appeal as such to the native or visitor because if one is faithful in reproducing a Mexican village it can have no appeal to the artistic sense. It is a thing altogether typical and true, and entailed much labor and a great deal of ingenuity. Instead of the thatched palm leaf roof we find tin roofs on the buildings of the Mexican Village. These roofs were constructed from tin cans found in and around the garbage plant. Lambert had his laborers flatten the cans and attach them.

Beyond the Mexican Village, Lambert still had a long bleak wall of solid rock, jagged by the many explosions of dynamite charges used in blasting the stone quarry. This developed another idea and he constructed a zoological garden. Like all of Lambert's other ventures it cost the city very little. By this time he had formed friends and admirers and there was much assistance. Many of the animals, most of them perhaps, were donated to the city.

There is probably not another zoological garden just like this one in America. Lions and tigers, bears and jaguars and dozens of other varieties of wild animals, are confined in homes here not dissimilar to their native haunts. Lions have their dens in caves; so have the bears and beyond them romp the deer, elk and moose. Beside them are the apes and the "cats" of many families. There yet remains rock wall where the zoological part of Brackenridge Park will receive additions.

Lambert still had part of the stone quarry to utilize and he constructed a mammoth floral star, representing the lone star emblem of the state of Texas. Many stars have been planted but probably never another as huge and striking as this one.

Other features were developed in the park. Artesian wells near by gushed constantly so Lambert corralled the supply of water from these wells and diverted it into a stream which winds through the park. In three places this stream is dammed and a "sunken bridge" constructed. These "bridges" connect the main driveway and automobiles passing over the "bridge" wade through a foot of water.

Lambert also constructed a swimming pool, the only one in these parts. He built dressing rooms and purchased bathing suits that can be rented very cheaply. He created waterwalls and sank glass tubes containing electric light bulbs. This light, coming through the falling water at night, creates an unusual effect.

Most of the buildings in the park are of stone. All of them will be before the year is out. Lambert can collect the stone free and a beautiful stone building costs him practically nothing for material. At present he is at work on a storage room for the menagerie, or zoological gardens. This building is copied after one of the famous ancient missions. Every feature is carefully reproduced. All the cost entailed is the labor.

There is a stone movie house in the park and instructive motion pictures, such as the Ford Weekly, are shown free of charge. There is a stone band stand where free concerts are given when the weather permits.

The children of San Antonio, like children of every other city, town, village, hamlet or crossroads in the country, are passionately fond of riding. So Lambert constructed a bridle path that winds around, up and down, for several hundred yards. He had the path but nothing to saddle and to overcome this little detail that was lacking one of the San Antonio's organizations presented the park with 25 burros. Now all the little boys and girls in San Antonio can learn to ride.

There came a public demand for marksmanship. The youth must be taught to shoot, they said, and Lambert built a rifle range. Every school in San Antonio has its rifle teams and expert marksmen are being developed among the boys.

Several army camps are located near San Antonio. The government encourages polo playing in these camps. It is a good thing, for no sport is as well suited for the development of soldiers as polo. But the camps and their polo fields were quite a distance away. Polo is a wonderful game for the spectator, dashing and thrilling with all the touches of the spectacular and picturesque. Since the people could not go to the polo fields to watch the teams play Lambert brought the teams to them. He built a polo field in Brackenridge Park and to make sure the teams would prefer to play at his park he built a field that is said to be better than any in the country. Of course, all polo matches are played without charging admission and the people of San Antonio can see the best army teams play free of charge.

Lambert saw the development of golf, noted the enthusiasm the game aroused and discovered why the average man cannot play golf, so he constructed an 18-hole golf course in Brackenridge Park. It is so popular that he is trying to find ways and means to construct another.

San Antonio is a great city for the tourists. They come to this historic town from all over the country. The large number of tourists taxed the hotels and it was impossible to take care of them all. Lambert solved the problem. He established camping grounds in his big park. Here the tourist can park his car and pitch his tent and live in the open. Meals are served at the Japanese Gardens and the Mexican Village. If the tourist wants to do his own cooking, Lambert furnishes the fuel. He also furnishes a spot where laundry work can be done, rather where the family washing can be accomplished. At times there are autos carrying the license plates of more than 40 states parked on this camp site.

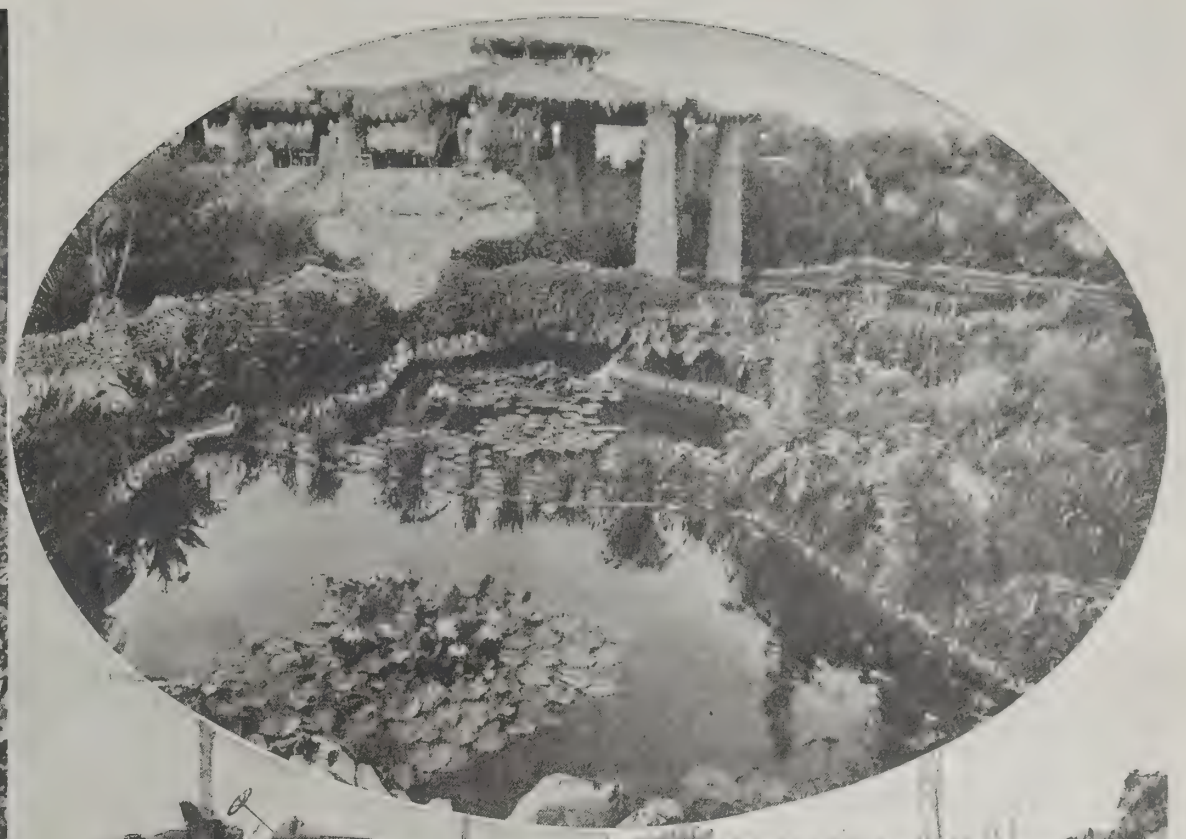
Also, there is a picnic plot. There are tables and benches. Some people like warm food, even when picnicking, so Lambert scattered fire places all over the picnic grounds and he furnishes the fuel free of charge. There are two baseball fields and four tennis courts and other features generally found in public parks.

Recently the public wanted a statue to commemorate the sacrifice made by San Antonians who died in the World War. Lambert asked for bids and the lowest he received was $10,000. So he set about to find material from which a statue could be made. He found it. Also he discovered a rock of ages in the stone quarry and the statue will be the Rock of Ages with a genuine rock of ages as the base. When completed this statue will cost less than $1,000. The amount has been subscribed.

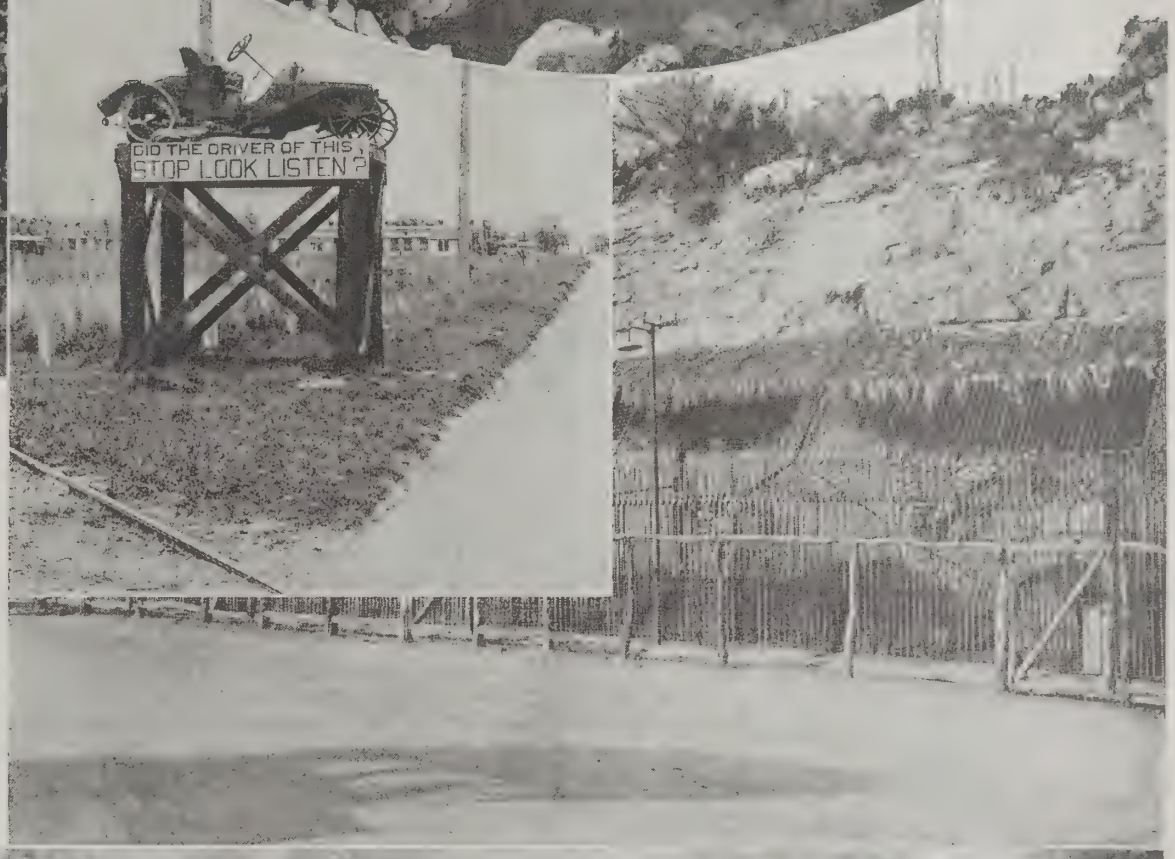
Not alone at Brackenridge Park did Lambert create a Garden of Eden from waste land and with abandoned material, but he utilized other waste matter to help the city and save the people's money.

In nothing that he has done does Lambert's ingenuity stand out with greater impressiveness than in his lesson of "Safety First."

Lambert instructed his men that whenever they discovered a wrecked car that was beyond salvage and had been abandoned by the owner, to bring it in. San Antonio has several dangerous railroad crossings and some fatal accidents occurred. The "Stop, Look and Listen" sign did not prevent deaths by collision and the crossings were quite often ignored in spite of the supreme danger.



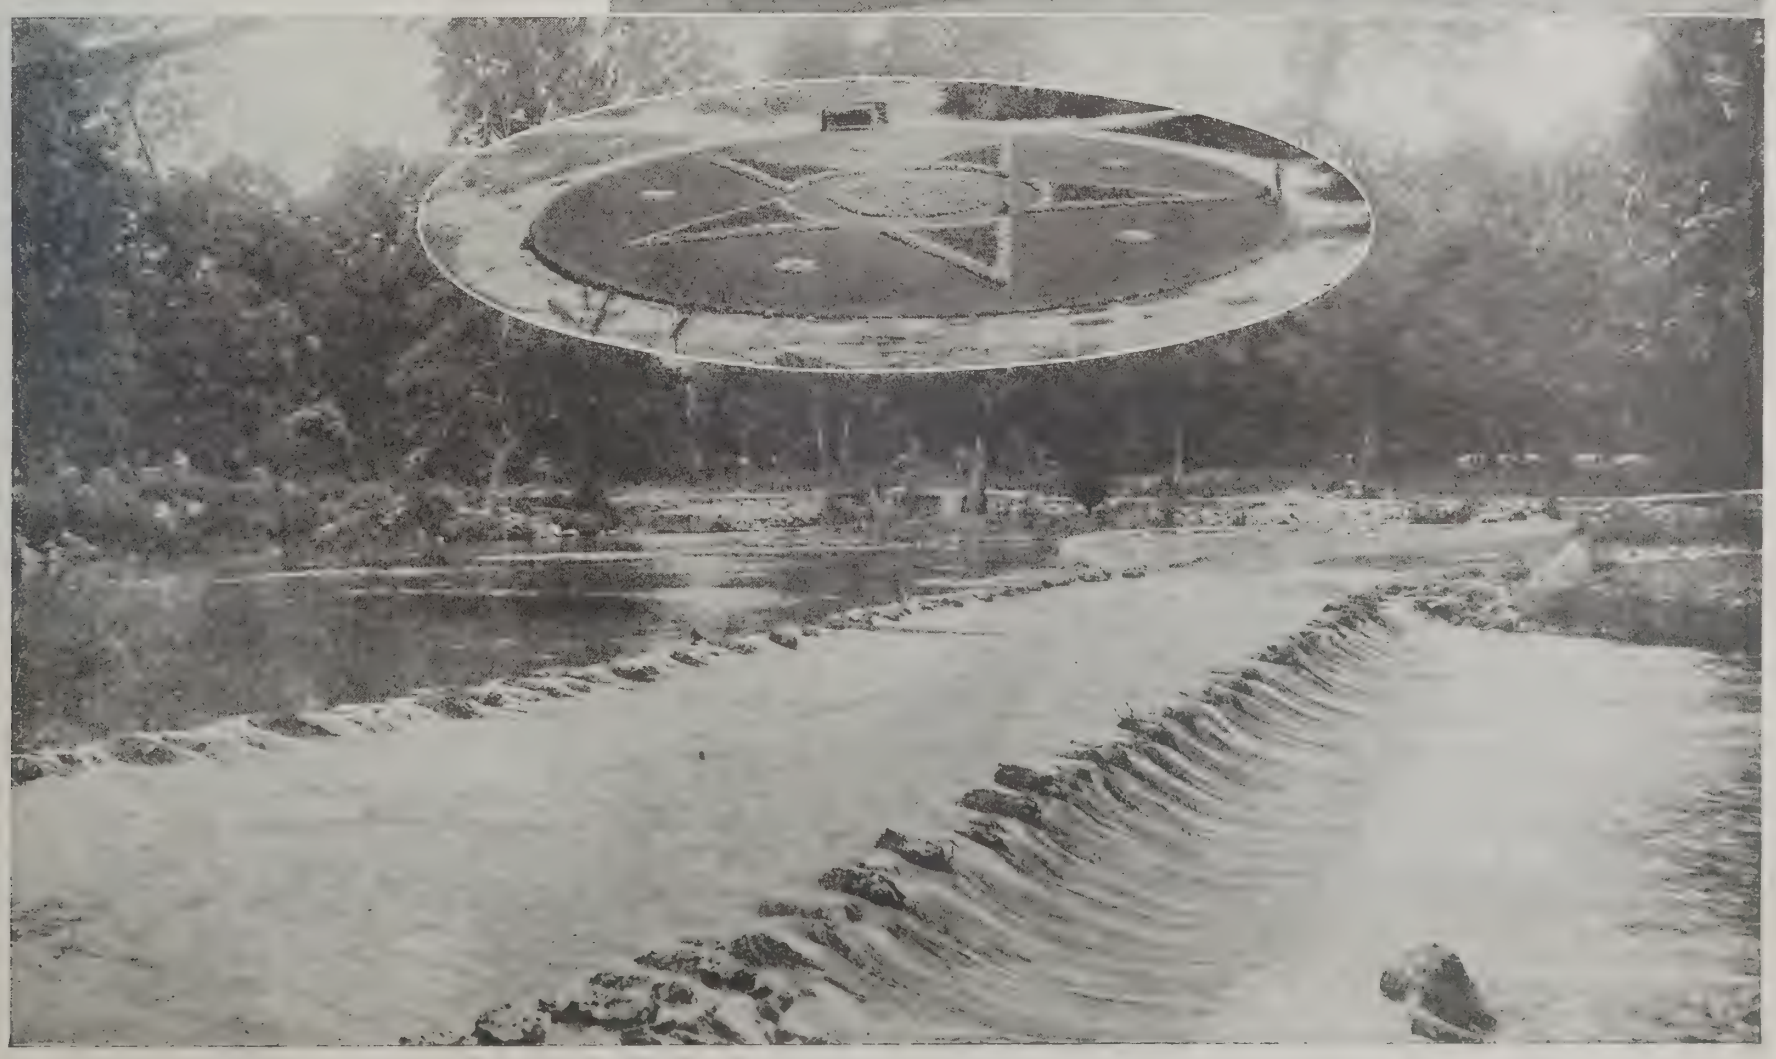
After collecting a number of smashed cars Lambert had platforms built beside the crossings. These platforms stand ten or twelve feet above the ground and are visible in each instance a few hundred yards before the crossing is reached. To these platforms were attached the wrecked cars and on the four sides of the platform are signs reading, "Did This Driver Stop, Look and Listen?" The list of accidents has greatly diminished in San Antonio since these platforms were built and the wrecks displayed.



San Antonio needed street lights. The people wanted lamp posts to help beautify the city. Lambert asked for bids and the lowest bid was $34 for each post. Lambert said it was much too much. He set about to devise a lamp post as good and cheap enough to make extensive use of the posts possible. This is what he did: He sent to the garbage plant and had hauled away all the tin cans and scrap metal dumped there. He sent to the dumping grounds and had his laborers gather all the cans and bits of metal they could find. Then he constructed a mold, filled it with cans and metal scraps and poured concrete over the filling. He set an iron pipe in the center and through this the post is wired. Completed, each of these posts will cost the people of San Antonio less than $7. Lambert is now having a machine built to be used as a mold. Every tin can tossed away by a householder of San Antonio, every bit of discarded metal, will be gathered by city laborers, collected, assembled and hauled to the municipal manufacturing plant. Soon San Antonio will be studded with artistic lamp posts, made of waste and costing less than $7 each.

Such is J. Raymond Lambert and such are his achievements. The story of his career as a public servant is one that could serve well as a model for any public office-holder as well as a lesson in economy and thrift, ingenuity and perseverance to every American.

Also, it shows that genius springs from queer spots, such as the riotous saloon of a wide-open town.



The Things That Lambert Does

Top, Right—The main Japanese house in the sunken gardens. Top, Left—A bridge in the Japanese Gardens. Center—How wrecked automobiles are used to keep others from being wrecked. Right—How the "hopeless" stone wall of the abandoned quarry was utilized in constructing a menagerie. Insert—The huge floral lone star in Brackenridge Park. Bottom—The artificial ford. They call this a "sunken bridge." There are three of these "sunken bridges" in the artificial stream that winds through the pet park of San Antonio. The fords connect the main driveway.

Jewish Hot-Beds of Bolshevism in the U. S.

"Needle Trades," a Constituent of the Kehillah, Examined: "Melting Pot" or Melting the Pot? The Kehillah's Link With the A. J. C.

BOLSHEVISM is working in the United States through precisely the same channels it used in Russia and through the same agents—Revolutionary and Predatory Unionism, as distinct from Business and Uplift Unionism, and Jewish agitators. When Martens, the so-called Soviet ambassador "left" the United States after being deported, he appointed as the representative of Bolshevik sovietism in the United States one Charles Recht, a Jew, a lawyer by profession, who maintained an office in New York. This office is the rendezvous of all the Jewish union leaders in New York, some of the labor leaders throughout the country, and occasionally of one or two American government officials known to be henchmen of Jewish aspirations in the United States and sympathizers with predatory radicalism.

The situation in New York is important because from that center lines of authority and action radiate to all the cities of the United States. New York is the laboratory in which the emissaries of the revolution learn their lesson, and their knowledge is being daily increased by the counsel and experience of traveling delegates straight out of Russia.

The American does not realize that all the public disturbances of which he reads are not mere sudden outbreaks, but the deliberately planned movements of leaders who know exactly what they are doing. Mobs are methodical; there is always an intelligent core which gets done under the appearance of excitement what had been planned beforehand. Up through the German revolution, up through the French revolution, up through the Russian revolution came the previously chosen men, and to this day in all three countries the groups thus raised to power have not lessened their hold—and they are Jewish groups. Russia is not more Jew-controlled than is France; and Germany, with all her so-called anti-Semitism, tries in vain to loosen the grip of Judah from her throat.

It is this fact of prepared disorder which makes the New York situation of interest today, because its lines of influence and authority reach everywhere throughout the country.

For that reason, and before showing how the Jewish organizations advance Bolshevism and revolution in the United States, the first step will be to describe the condition and extent of the Hebrew labor movement.

When Fifth Avenue Changed Color

MOST New Yorkers remember the "Save Fifth Avenue" movement. That avenue, from Fourteenth to Thirty-fourth street, with sections of Broadway, is historic ground. It is wrought into the history of America in a peculiarly intimate way. A little more than 15 years ago it contained the homes of the older families, the establishments of famous publishers, the stores of art dealers, and the famous shopping center. It was a district known throughout the United States as typifying American substance and good taste.

But presently, Americans who thought they were secure in their own city, were aware of an advancing shadow. A subtle atmosphere of deterioration became evident. In the top lofts of buildings, sweatshops had been installed, which noon and night poured into the streets an alien stream—not a glad, hopeful-eyed immigrant rejoicing to be in America and at work, but something darker.

It was the Russian and Polish Jew. He swarmed into this district, the most typically American of any outside of Boston and Philadelphia, from the first. Nowhere else would the sweatshops go except in the very heart of Goy respectability. There were protests and organizations; Jews were appealed to in the name of the city; they smiled and promised, but like a tide coming in, the invasion swept farther and stronger every week. New Yorkers hesitated to go down into the district to trade, and merchants lost their business. Real estate values dropped in consequence, and Jews bought valuable properties at low figures.

Today, at noontime, Fifth Avenue is packed from wall to curb with dark, squat figures in masses of thousands. They parade in dense throngs and make the street impassable. They make a strange un-American atmosphere, Slavonic with some Oriental admixture. Their tongue is alien, their attitude is one of sullenness mingled with a sense of power. You leave the New York of American meaning whenever you approach that alien throng. They have taken over the district as completely as if they had invaded it with the bayonet.

All this would be very hopeful, of course, if we could take and sustain the attitude of the unsophisticated young reader of fiction, and regard these people as "new Americans." There is a mass of moving stories (mostly written by Jews, by the way) pretending to describe the glowing hearts with which these throngs look out upon America, their intense longing to be American, their love of our people and our institutions. Most unfortunately, the actions of these people and the utterances of their leaders give the lie to this fair picture which, as Americans, we would fain believe. The resistance offered to Americanization, consisting in the limitations put upon the Americanization program, has been sufficient to convince all observers that, so far as the Jewish invasion is concerned, it is not their desire to go the way America is going, but to influence America to go the way they are going. They talk a great deal of what they bring to America, hardly anything at all of what they found here. America is presented to them as a big piece of putty to be molded as they desire, not as a benign mother who is able and willing to make these aliens to be like her own children. The doctrine that the United States is nothing definite as yet, that it is only a free-for-all opportunity to make it what you will, is one of the most distinctive of Jewish political teachings. If it be provincialism to insist that our alien guests become American and cease their endeavors to make America something alien, then there are hundreds of thousands of Americans to plead guilty to provincialism.

Melting the Pot?—Or Its Contents?

"THE Melting Pot," a term to which Mr. Zangwill gave currency, is not a very dignified name for our Republic, but aside from that, it is being more and more challenged as descriptive of the process that goes on here. There are some substances in the pot that will not melt. But more significant still, there are rapidly increasing interests *who want to melt the pot.*

So far as Fifth Avenue was concerned, it was the pot that melted. At least, not the most intrepid Jewish leader will shout much about the American characteristics of the most conspicuous Jewish colony in the world, that of New York.

The loft buildings in this district are filled with clothing workshops, of which the Jew has a monopoly in the United States. Coatmakers, pantmakers, buttonhole workers, ladies' garment workers, these men are engaged in the "needle trades" in which adult men of no other race participate.

Why the tendency of the Jew to the "needle trades?" It is explained by his aversion to manual labor, his abhorrence of agricultural life, and his desire to arrange his own affairs. Arriving in the city of his destination, the Jew would rather not leave it except for other cities. There is one Hebrew society whose charter would indicate that its work is the placing of Jews in the rural districts, but it does next to nothing in this respect. On the other hand, there is testimony that city colonization goes on apace. Widespread Jewish associations are on the lookout for likely towns in which to settle a few Jews, who in time become a larger colony, and in a little longer time run the place. There is nothing haphazard about it. The Jew is not an adventurer, he does not cut himself off from his base, but all his movements are made under consultation and direction. New York is the great training school in which the newly arrived immigrant receives his instructions as to the method of handling the American goyim.

Why Jews Choose "Needle Trades"

THUS, preferring any kind of a life in the city, and not taking to the trades which involve much bodily effort, the Jew gravitates to the needle, not in the capacity of a creative artist, as is the commercial tailor, but in the production of quantities of ready-to-wear goods.

Aside from the "white collar quality of the job," the "needle trades" appeal to the Jew because at such work he can practically arrange his own hours. For this reason, the Jew generally prefers piece work to day work, domestic industries to factories—he can arrange his own time. Many people wonder how the Jews of New York have so much time for revolutionary consultation, parades, meetings, demonstrations, restaurant debates and radical authorship. No other class of working people can get the time; other people work pretty steadily. The explanation is at hand: extreme Socialism and Bolshevism have a great deal of "time off."

Trotsky, the present head of Russia, lived that way in New York. His main arrangement was for leisure to work up his scheme. All the East Side leaders knew that Trotsky was to "take the Czar's job," even though he never had an extra dollar to spend. There was nothing haphazard about it. It was prearranged, and the appointed men went directly to their preappointed places. The East Side has other rulers ready now, and they live in the midst of the revolutionary "needle trades."

One point that should not be overlooked in all this, of course, is that the "needle trades" being exclusively Jewish, all their abuses are Jewish too. This is said for the benefit of those apologists for Russian Bolshevism who explain that the reason for it all is the way the poor "Russian" was treated in America. If Americans will ever learn to remember that the Russian is not a Jew, and that Bolshevism is not Russian but Jewish, and if in addition to that the American will ever learn to remember that every Russian-Jewish laborer in New York comes into contact with a Russian-Jewish employer, and every Russian Jew tenant pays his exorbitant rent to a Russian Jew landlord, it will then be clear that once more has the United States been made to bear a slander that does not belong to it.

It may be well to remember also that it was on account of these Russian and Polish Jews, while they yet resided in Russia, that the United States broke off her trade treaty with that country—broke off with the Russia that was a country and a government before America was discovered; and, having by that act contributed to the Jewish throttle on Russia through Germany, it is now proposed that the United States, on account of these same Jews, enter into trade agreements with the present Russian tyranny. Verily, the diplomacy of Judah has come very near determining our foreign policy. If they were strong enough, in spite of President Taft's refusal, to make us break with Russia, they may also be strong enough to make us shake hands with Bolshevism.

The Exclusively Hebrew Trade Union

THE Jewish trade union is exclusively Jewish for the reason that the trades affected are exclusively Jewish. That is, the Jewish trade union is not an American trade union, it is not a mixed trade union, it is Jewish. Like all other Jewish activities the purpose of the trade union is to advance Jewish interests alone. These unions are one aspect of United Israel.

This should be borne in mind with reference to the widespread strikes in the clothing trade and the rapid increase in the price of clothing to the 99,000,000 non-Jews in the United States. In spite of all the strikes, the profits advanced enormously; it may be said that the strikes were essential to the advance of profits; and the country as a whole paid.

Look at some of the figures of the "needle trades" before the war. In the entire United States, the men's and women's clothing manufactured in 1914 had a value of $932,099,000. In New York alone, $542,685,000 was produced. The rest was produced by the Jewish clothing centers in Chicago, Cleveland, New Jersey and Philadelphia.

The figures for the period of the war and since will be staggering. Clothing in the regular trade began to mount in price, until at the end of the war in 1918, it had attained an increase of 200 per cent and 300 per cent. Until well into 1920 the monopoly held up the price. This was done in face of the declaration by the manufacturers of *cloth* that the whole profiteering persistence was due to the manufacturers of *clothing.* Russian-Polish Jews, in this country only a few months, drew $50 to $80 a week. Threats of strike were used to get a five per cent increase in wages, which was met by a 20 per cent increase in the cost of clothing. The American public paid.

If, however, these statements were merely an attempt to arouse indignation that for once the workers got more than they earned, the attempt would be a failure. It is pretty hard to find anyone to regret the workers getting hold of a bonanza. The high wages

weren't of much use, as it proved, but people at least had the satisfaction of handling them.

These statements are made to show that during the war the Jewish unions waxed fat, a fact which has a bearing on their Bolshevik attitude today. Not all the wage was the gain of the man who earned it—there was the union to pay. Girls in the fur trade in New York earned $55 a week, of which they paid in $27.50 a week to the unions. Other workers paid in like proportion. There was great talk of what would be done. In Russia, of course, they had the government's gold vaults immediately upon the success of the revolution, but in the United States the preliminary funds would have to be supplied by themselves. A great revolutionary stroke was planned, of which the written evidence still remains.

There are two divisions of Jewish wealth and power centering in New York. The first is German-Jewish, represented by the Schiffs, the Speyers, the Warburgs, the Kahns, the Lewisohns and the Guggenheims. These play the game with the aid of the financial resources of the non-Jews. The other division is composed of the Russian and Polish Jews who monopolize the hat, cap, fur, garment and toy trades. (By the way—it is the Russian and Polish Jew who controls the American stage and movies also.) Between them, their grip and influence is far from negligible. They may sometimes have internecine quarrels regarding the division of the profits, and eager publicists may zealously call attention to these quarrels as evidence of the lack of unity among the Jews, but in the Kehillah and elsewhere they understand each other pretty well, and on the question of Jew vs. "goy" they are indivisibly one.

Between these two forces the attempt to hold up prices was continued until late in 1920. The heads of the Jewish clothing associations announced that the price of clothing would not be lowered. Solidly behind them were the associated Hebrew labor unions, so-called, which threatened dire things if the prices came down. The first great store to reduce prices in New York was Wanamaker's, a non-Jewish house. In fact there was no reduction of prices among Jewish manufacturers and merchants generally, until in the month of November less than a dozen Jews were called into the presence of a non-Jewish financier, after which a belated effort was made to save the buying market by sensational reductions. The Jewish controllers of the clothing business had just previously stated that not only would prices not go down, but the 1921 prices would go still higher.

The Open Eye Is Protection Enough

THERE is a distinction between what the Jewish coalition *would* do and what it *could* do, but its will and its power never so closely correspond as when the non-Jewish element is asleep, and never are Jewish will and power so widely divorced as when the non-Jewish mind is alert. When the non-Jewish financial mind made itself felt in November, 1920, the bottom dropped out of Jewish trade prophecies and policies. The only thing to fear is not the alert Jew, but the consequences of sleepiness among the Christians. *The Jewish Program is checked the moment it is perceived and identified.*

Ordinary people who for five years have been paying high tribute to the clothing trust are entitled to know who comprise that trust. But that is a trifling affair compared with the political uses to which the clothing trust has been put in this country. The clothing trust, being composed exclusively of Jews, most of whom have formed the ax-head of Jewry in the fight against certain Old-World governments, is today the heart and center of a movement which, if successful, would leave not a shred of the Republic, its institutions, nor even the liberty, which is every American's by inheritance.

What is the strength of these people? How are they banded together? What are the facts concerning them?

In New York City alone there are 2,760 Jewish cloak and suit manufacturing concerns; 1,200 Jewish clothing manufacturers; 2,880 Jewish fur manufacturers; 600 Jewish skirt manufacturers; 600 manufacturing tailoring establishments; 800 Jewish merchant tailoring concerns.

These employers have organized themselves into associations such as the following:

Associated Boys' Clothing Manufacturers of Greater New York.
Associated Fur Manufacturers.
Associated Shirt Manufacturers.
Association of Embroidery and Lace Manufacturers.
Children's Dress Manufacturers' Association.
Cloak, Suit and Skirt Manufacturers' Protective Association.
Cotton Garment Manufacturers of New York.
Dress and Waist Manufacturers' Association.
East Side Retail Clothing Manufacturers' Association.
Ladies' Hat Manufacturers' Protective Association.
Mineral Water Dealers' Protective Association.
National Association of Separate Skirt Manufacturers.
National Society of Men's Neckwear Manufacturers.
New York Association of House Dress & Kimono Manufacturers.
New York Tailors' Verein.
Shirt Manufacturers' Protective Association.

Where the Kehillah Gets Its Strength

AMONG the employed Jews, the unions are numerous but all gathered up into one central organization. For example, the International Fur Workers' Union of the United States and Canada, is made up of the following:

Feather Boa Makers' Union.
Fur Cap Makers' Union.
Fur Cutters' Union.
Fur Dressers' Union.
Fur Dyers' Union.
Fur Floor Walkers' Union.
Fur Hatters' Union.
Fur Head and Tail Makers' Union.
Fur Lined Coat Finishers' Union.
Fur Nailers' Union.
Fur Operators' Union.
Fur Pluckers' Union.
Muff Bed Workers' Union.

In the garment industry, the organizations include every operation in the process of making clothes. There are separate unions for buttonhole makers, vest makers, pants makers, coat cutters, coat operators, coat pressers, coat tailors, coat basters, lapel makers, knee pants makers, clothing turners, overall workers, palm beach workers, shirt makers, vest pressers, and even a washable sailor suit union. These together comprise the Amalgamated Clothing Workers of America.

In children's clothing we have another complete organization:

Children's Jacket Makers (three unions).
Children's Jacket Pressers.
Children's Sailor Jacket Makers' Union.
Children's Cloak and Reefer Workers' Union.
Children's Dressmakers' Union.

In women's wear, there are unions organized around every garment known to the wardrobe, some of which are:

Amalgamated Ladies' Garment Cutters' Union.
Bonnaz, Singer and Hand Embroiderers' Union.
Buttonhole Makers and Button Sewers' Union.
Children's Cloak and Reefer Workers' Union.
Cloak and Suit Tailors' Union.
Cloak and Suit Piece Tailors and Sample Makers' Union.
Cloak Examiners, Squarers and Bushelers' Union.
Cloak Makers' Union.
Cloak Operators' Union.
Cloak, Skirt and Dress Pressers' Union.
Ladies and Misses' Cloak Operators' Union.
Ladies' Tailors Alteration & Special Order Union.
Ladies' Waist and Dressmakers' Union.
Skirt and Cloth Dressmakers' Union.
Waterproof Garment Workers' Union.
White Goods Workers' Union.
Wrapper, Kimono, House Dress and Bath Robe Makers' Union.

These unions comprise the International Ladies' Garment Workers' Union.

Jewish Unions, Not With A. F. L.

THE reader will have an idea, after reading these lists, that the employes represented in these unions are women. The majority are men. It may require something of an effort to remember that, but it is essential. These organizations control an essential business which *before the war* produced over One Billion Dollars' worth of goods a year, and since the war has probably received for its products each year the amount of a big fat Liberty Loan; and these unions have received 30 to 40 per cent of that for wages and propaganda funds.

Now, let it be said at once that these Jewish unions are not to be confused with the regular Labor Union Movement, as we know it in the United States.

They are not Jews who have gone into the American trades unions. They have started unions of their own, which are Jewish in membership, control and purpose. It is true, of course, that the regular trades union movement which heads up in the American Federation of Labor is under the presidency of a Jew, Samuel Gompers, but the membership is mixed, the large majority being non-Jews, and the purpose is not racial.

These Jewish unions comprise a body by themselves and are to be reckoned with, not only as labor union groups, but as racial and political groups whose purposes can be determined by the character and utterances of their leaders, as well as by the actions authorized and approved by the unions themselves.

Now, *this Hebrew union movement is a part of the New York Kehillah.* Jewish leaders have sought to counteract THE DEARBORN INDEPENDENT'S account of Kehillah activities by saying that the Kehillah is such a little weak thing. Admittedly, however, the Jewish clothing trust and the Jewish garment workers' unions are among the biggest and most powerful aggregations in the country. Not even a Jewish leader would have the temerity to deny that. Well, the Amalgamated Clothing Workers of America and the International Ladies' Garment Workers' Union are affiliated with the Kehillah.

More than that: this Kehillah, which Jewish spokesmen with cool contempt for truth would have the public believe was weak and unimportant—*this same Kehillah, in its Executive Committee, constitutes The American Jewish Committee.*

Is the American Jewish Committee a nonentity? Ask any President of the United States, any Senator or Governor?

The American Jewish Committee heads up in District No. 12—New York City—and the Committee for District No. 12 *is also the Executive Committee of the Kehillah.*

The men who represent before the world the combined organizations mentioned in this article *are* the Kehillah, and they *are* the American Jewish Committee, and besides, they are the men whose failure in candor has left such an impression of dissatisfaction throughout the masses of the Jewish people.

The "Weak" Kehillah and Its Jewish Giants

WHO are they? Who are these men with whom the Kehillah is said to be such a puling thing?

Louis Marshall, of the law firm of Guggenheimer, Untermeyer and Marshall. Mr. Marshall is not only head of District No. 12, but he is also head of the American Jewish Committee. His headship of the A. J. C. makes him Jewish leader of the United States. His headship of District No. 12 makes him head of the New York Kehillah. Quite an important man? Yes; and an important place, in spite of lying Jewish spokesmen.

Who are the others? Eugene Meyer, Jr., formerly of the Capital Issues Committee of the United States war government.

Who else? Judah L. Magnes. Judah L. Magnes is the organizer and active leader of the New York Kehillah. The two bodies are linked up again. They are linked up by the Kehillah's constitution which is able to decree that its executive committee shall be the American Jewish Committee as far as District No. 12 (New York City) is concerned.

There are other names on the American Jewish Committee which also constitutes the executive committee as the Kehillah—Adolph Lewisohn, Cyrus L. Sulzberger, Felix Warburg, and so on, 36 in all.

In the current annual report of the American Jewish Committee this relation with the Kehillah is acknowledged in a note at the foot of page 123, just as in the constitution of the Kehillah its relation with the A. J. C. is acknowledged and explained.

Now to recapitulate.

The Hebrew labor unions, both of employes and employers, which are in complete control of the garment industry of the United States, represent one wing of Jewish aggression in the realm of political revolutionism. It is not a small wing in itself. Certainly it does not become smaller by its connection with the Kehillah, nor the Kehillah by its gain of these workers. The two unions mentioned above number over 337,000 members. That figure is conservative. Besides these there are associated with the Kehillah the members of 1,000 other Jewish organizations, such as synagogues, charitable societies and educational bodies, and 100,000 individual members who belong on their own account.

Link this organization with the powerful American Jewish Committee, and at once the protest of the editors and the spokesmen that the Kehillah is a weak, unimportant body becomes a deliberate falsehood.

And as for those "Gentile fronts" who are ready victims of Jewish propaganda, and who, without personal knowledge, are describing the Kehillah as a large and flourishing charitable society (bad teamwork there!) let them read in the next article what some of the Kehillah leaders are trying to do to the United States.

The man who really collects your taxes.

Naval Program May Waste Millions

THE House Naval Affairs Committee of the Sixty-sixth Congress was moved to an exhaustive and illuminating inquiry by two resolutions offered in the Senate by William E. Borah, of Idaho. The first expressed the advisability of the early convening of representatives of the great naval powers, Great Britain, Japan and the United States, with a view to arriving at an agreement for the mutual suspension of naval building programs for six months. The second resolution called for a thorough investigation of the question of "what constitutes a modern and efficient navy," with a view to ascertaining whether or not we are building a navy which when completed will in any sense be a modern fighting navy.

In a report of the General Board of the Navy dealing with the "naval holiday" resolution, signed by Rear Admiral Charles J. Badger, and approved by Admiral Coontz and by the Secretary of the Navy, the ground is taken flatly that, in view of the important facts regarding the naval operations of the war, "further delay of six months, or any other period, for the study of types of ships is neither necessary nor advisable."

Among reasons advanced for this conclusion is that concentration of power in attack is the fundamental basis of all warlike operations, ashore and afloat, and that "the strength of navies has always been based upon the number of their ships of the fighting line."

The board affirms that arguments against the expensive capital ships are based upon "the old fallacy" that war can be cheaply won by hitting, dodging and running. Speed without punch, it is declared, is insufficient to win a war. At the battle of Jutland, nothing was accomplished in the way of destruction of battleships by torpedoes. While admitting that during the recent war the submarine received tremendous development, and came very near winning the war for Germany, it is insisted that "as always, necessity and invention combined found means to meet the menace and reduce it to controllable limits," so that defense against submarine attack was at last developed to a point where it was successfully met, and "again surprise and dodging failed." As to the challenge to battleship supremacy contained in bomb and torpedo-carrying aircraft, we are told that these weapons will continue only to be "adjuncts to the fleet." While great things were predicted by the inventors and enthusiastic supporters of these new weapons, "predictions are one thing, actualities are another; and, as yet, the protected gun is the most generally effective weapon in existence for naval use."

Despite this defense of the battleship, the General Board reports that airplane carriers are a development of the war of highest importance. These ships are designed to carry airplanes in considerable numbers and to serve as a base from which aircraft may fly and to which they may return. Such vessels "should be considered as an absolutely essential type in a modern fleet."

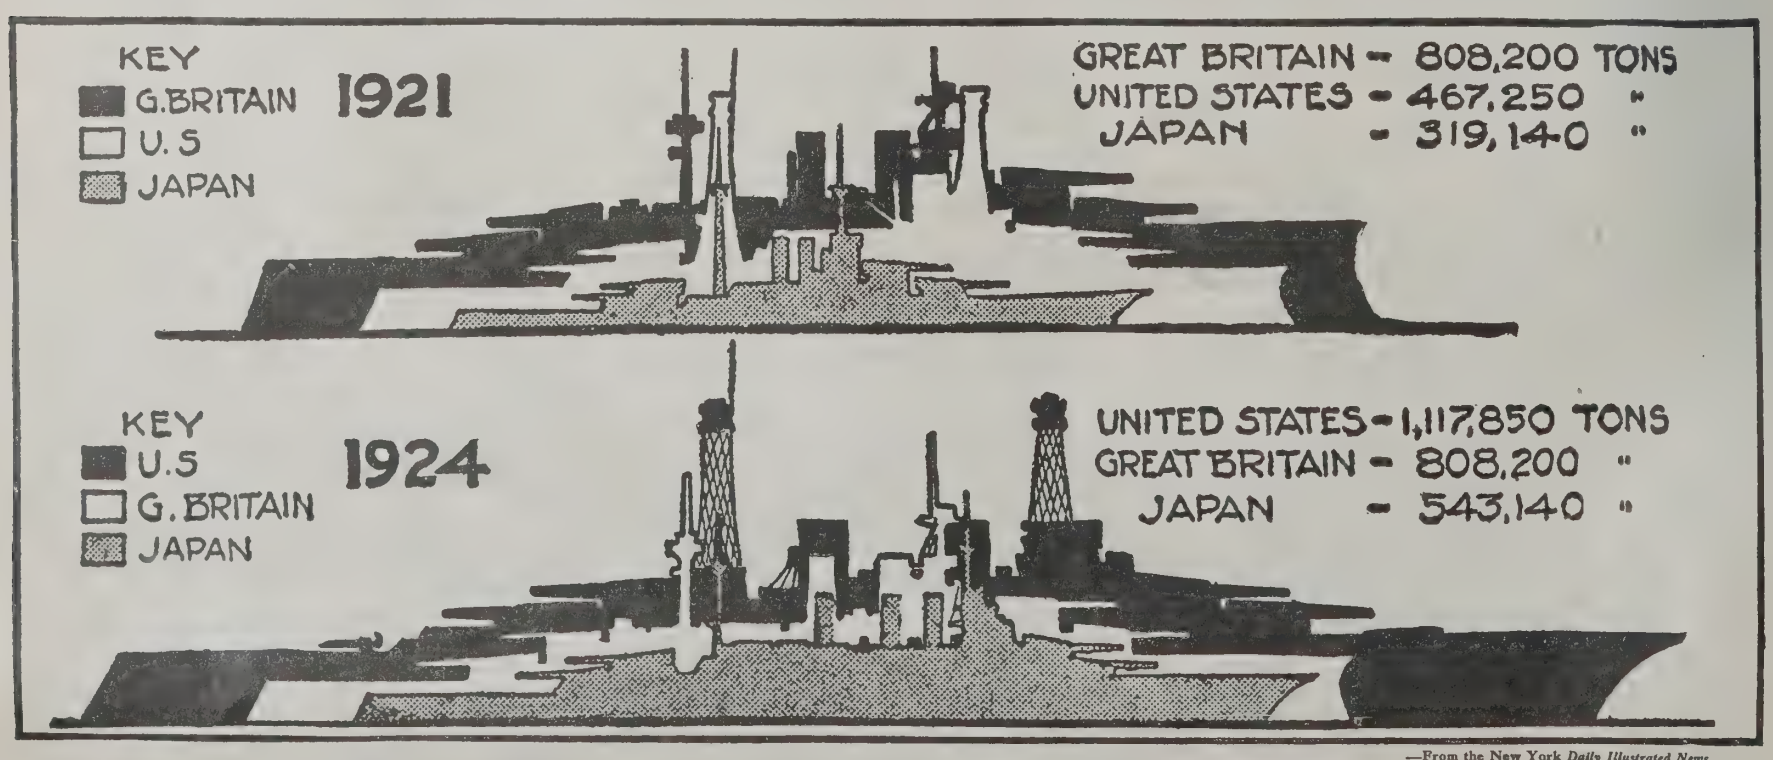
These airplane carriers are not regarded, however, as likely to displace or even diminish the need for battleships. Instead of reducing the cost of armament, they increase it immensely. The two called for in the estimates now awaiting congressional action are to cost $28,000,000 each!

Attention is called by the board to the fact that the building program authorized in 1916 will, if completed, give us, for the first time in the nation's history, substantial equality with Great Britain in power, if not in number of ships, for our battle fleet, and adds:

> In urging that this equality in power be the continuing naval policy of the United States, there is no thought of instituting international competitive building. No other nation can in reason take exception to such a position. In assuming it, the United States threatens no other nation or nations by the mere act of placing itself on an equality with the strongest. It cannot be justly construed as a challenge. There is no good reason why the United States should not enjoy the trust of other nations to the same extent as she is expected to repose trust in them.

Apparently, Mr. Daniels and the General Board of the Navy see no contradiction in asking that the United States take the initiative in an international disarmament policy and at the same time insisting on ourselves continuing a naval building program for three years in order to add 16 battleships and a swarm of complementary ships to our fleet. Will not Mr. Harding realize that a big fleet to bring about disarmament is a paradoxical idea? Britain might ask why we should be alarmed for our safety now that we rank second in naval power, when we felt no alarm during the generations we ranked a poor third. Surely we may win laurels all our own sufficient to satisfy all reasonable national ambitions, without bothering our heads to challenge the title of the world's champion sea-fighter. Let America be the champion builder and beautifier of the earth, the champion farmer, the champion industrial producer; the helper and healer rather than the bruiser of the nations! If other nations have other tastes, what is that to us?

This alleged necessity or desirability of having "a navy second to none" is put forward by our naval officials as the one great reason for urging that "no rest period of limitation of armament be agreed upon which will modify the authorized building program of 1916, in numbers, general types and *date of completion.*"



It is not merely that the completion of our present three-year building program would lay a heavy immediate burden upon the people. We are probably the only nation in the world today that has all the money needed for domestic development, if we do not waste it on militarism. Neither Britain nor Japan has the money to fight us, even if they wished to do so—and there is no reason to warrant the belief that either or both would be guilty of the madness of seeking such a war. We have no ambition to conquer anyone, and no one else is in a position to conquer or dream of conquering us. This world situation makes the present time peculiarly favorable for our initiative in a magnificent effort to procure world disarmament.

No nation lives or dies, prospers or suffers, to itself alone. As a matter of hard fact, it is probably true that if we want to have a bigger navy than the navies of Great Britain and Japan combined we can have it—and there is just as much reason for having such a navy as for having one "equal" to that of Great Britain alone, which is no reason at all.

We have the money to build mightier armadas than either of those nations now possesses or is ever likely to possess. But as we build, Britain and Japan, and every other nation with a navy, would have to try to come as near to us as they could, being forced to consider more and more the possibility of our attacking them.

Every ship we built would mean not only a tax on our own heavily burdened people, but also a tax on all the other peoples in the world. Such a course would be heading straight for another world war in a desperate and foolish attempt to escape universal bankruptcy. In the rebound, America, having most to lose, would be the greatest sufferer.

"You cannot make an A1 nation out of C3 men," said Mr. Lloyd George in a speech summing up obvious lessons of the World War; "and you cannot have anything but C3 men if you give them nothing better than C3 houses to live in." In both Britain and the United States, it was found that it was easier to train a healthy, well-fed and fairly educated man into an efficient soldier in three months than to work that transformation in six months in a man under-developed physically and mentally. Ten million dollars spent on giving men and women a fair day's pay for a fair day's work, and instilling them with the character-building practice of giving a fair day's work in return for a fair day's pay, will prove more effectual in the way of national "preparedness" than forty millions spent on a battleship. Our invulnerability to attack from within or without rests on the establishment of conditions that make for peace and contentment, productivity and orderly progress. Not big guns, high explosives, nor poison gas; but schools, playgrounds and athletic fields, and the intelligence and the leisure to enjoy them, must ever be the shield and buckler of this republic.

—From the New York *Daily Illustrated News.*

This comparative study of the three greatest navies shows what they are today and their rank three years from now, if building programs are carried out.

The Wonder Work Shops of Washington

Government Bureau Whose Task It Is to Find Standards Does Much to Aid Development of American Industry

MOST disputes, someone has said, are due to differing definitions and not to differences as to the principles involved. A person orders a bolt of blue cloth. What is received may be blue and cloth but utterly useless for the purpose intended. For there are as many kinds of blue as there are of cloth. If you wanted any particular kind of blue or any particular kind of cloth, it would be very difficult for you to state your need in specific terms.

If you were to ask the average man, What is a bushel of potatoes, he probably would reply that a bushel contains so many pounds, which as a matter of fact may or may not be a bushel. A pound of something to most of us is just sixteen ounces and an ounce so many grains.

Possibly you will be surprised to learn that there are practically no nationally decreed measuring instruments. The makers of our Constitution, who were very wise men, thought there should be, and empowered Congress to decree them. But when Congress started to do so, it found that bushels, gallons and pounds were different in different sections of the country. The English weights and measures system then and still in ordinary use was not a uniform system, even in England. The particular standards of weights and measures used in different sections of the country were in the main those used in that section of England from which the early settlers came. There wasn't much interstate commerce, and the need for uniformity was not pressing.

So Congress hesitated to disrupt local and sectional customs by decreeing national standards of weights and measures. It has never done so, although it has "authorized" the use of the metric system and established the troy pound for use in the precious metal trades. Within the last few years Congress has standardized a few containers, the barrel for certain uses and the berry basket. But despite insistent demand for uniformity Congress has refused to take more than a modest creep in the direction of standardization of even weights and measures.

It is held that Congress has the power to fix standards of virtually every kind, even of quality, but custom is beset by so much conflict and confusion that Congress refuses to enact virtually every standardization bill considered by it.

Despite Congressional hesitancy, uniform weights and measures have come into use, as far as scales and bushel, gallon and such measures are concerned. These weights and measures are now well defined by state laws which also provide generally for inspection. The weights and measures standards follow the standard decreed about eighty years ago for use by the Treasury Department in collecting customs. Not long after that decree was put forth, Congress directed that duplicates of the Treasury standards be furnished each state but left the use optional. A division of the Coast and Geodetic Survey was set up to keep in touch with the state authorities and help them to promote uniformity in weights and measures. That is as far as we got with national standardization up to twenty years ago, and is about as far as regulatory law has ever gone.

In 1901 Congress created the United States Bureau of Standards chiefly to promote uniform and accurate weights and measures. The bureau was and still is singular in the respect that it has no police powers. It is an experimental, advisory and propaganda establishment and is one of our wonder establishments.

Its original weights and measures work is now only incidental to its broad field of operations—a field that today includes almost everything. That field, succinctly, is the field of definitions—the definition, as an example, of what is meant by "navy blue," the determination of what kind of brick may be safely placed in the walls of a 20-story building, the lifting or holding power of a certain strip of steel. Its work touches upon the interests of every industry and upon the needs of every individual. It aims to find the truth and set up means by which things may be subjected to the test of truth.

If you don't believe there is a field for such work hearken to what an official said to the writer the other day:

"We want our work to be known and appreciated by the public but we can't take care of a large proportion of the appeals coming to us now and as for visitors, we haven't time to show them any attention. To put it bluntly, we don't need advertising."

The tests the bureau makes are only a small percentage of what might go there, if the need of standardization were fully appreciated.

A fascinating branch of the bureau's work is that having to do with colors. A few years ago we had no accepted standards, for instance, for shades of blue or green or gray, or other colors. Such a condition caused many court fights that resulted only in further confusion because there were no bases from which to work.

Finally the problem was put up to the standards bureau. The bureau took the spectrum and those never-changing shades of light duplicated on paper now furnish the basis for determining the accuracy of any shade of color. The spectrum supplies the base for several of the few absolute standards we have. If all the scales and all the measures in the world should be destroyed, even those made of irridium and buried in underground vaults in Paris, and their duplicates kept in vaults in Washington and never handled, it would be possible to create new standards of absolute accuracy. For the meter, key to standards of measurement, finds parallel in the waves of light that do not vary.

Light waves enabled specialists to evolve during the war a method for making gauges that are so nearly perfect that the mind cannot grasp their exactness. They were needed in quantity production of munitions manufacture. In many cases one piece of important munitions would be manufactured in one plant, one in another, a third in another. Then the parts would be assembled at some central point. It was important that each factory have gauges as nearly accurate as could be achieved. A man named Johansen in Sweden was the only person in the world, it was claimed, who made such gauges and all that we had used came from his factory. A man working with the Bureau of Standards discovered the Swede's secret and the bureau now turns out gauges considered by many superior to those made by Johansen. They are within millionths of an inch of accuracy, so perfect that when the surfaces of two are placed together no man is strong enough to pull them apart. They are tested by the unchanging waves of light.

Study of the spectrum has led to adventures in the science of photography. As every amateur photographer knows, ordinary camera plates are not sensitive to red light; yet the red rays of the spectrum penetrate fog better than other rays. A dye sensitive to red rays was developed for use in airplane photography.

"The time is not far distant when this method will be used in ordinary films because it gives better color values," says Dr. S. W. Stratton, director of the Bureau of Standards.

In finding standards the bureau has to deal with processes of manufacture. In its big plant on the outskirts of Washington there are mills in miniature to make many things like paper, textiles and glassware. Actual products are turned out. This leads to improvements in processes and to the development of entirely new ideas of manufacture.

There the optical glass industry, now in a flourishing state, began only a few years ago. Prior to the war every binocular, every camera, microscope and other optical instrument of precision made in America was dependent upon optical glass that came from Europe, chiefly Germany and Paris. It was made by a few foreign firms that kept the processes secret. When supplies were shut off, the Bureau of Standards determined to win the secrets. One of the most difficult had to do with the making of refractory pots. The molten glass would eat through anything we had been making in pottery. Abroad it took two years to make refractory pots. The Washington bureau found how to turn them out in a month's time. When we entered the war we were in position to manufacture all the optical glass needed and several American firms are now engaged in the business commercially.

When the airplane came into practical use it was necessary to determine how motor engines would work at altitudes of 15,000 and 20,000 feet. An appeal was made to the Bureau of Standards. Instead of sending men up in planes a device was created to duplicate atmospheric conditions as far as 40,000 feet from the surface of the earth. It was a cement inclosure, from which air could be pumped, and which also could be refrigerated to the degree of cold prevailing in the upper air. In that inclosure observations were made of engines in operation.

A curious implement is a testing machine with a capacity of 2,500,000 pounds for compression and about half of that for tension. Steel columns bend like sheets of tin under that pressure and the same machine tears in two like cotton rope great steel cables such as are seen holding up sections of bridges. From experiments made with that machine are now growing rules by which engineers may subject materials going into big structures to definite tests of strength. In the Pittsburgh laboratory of the bureau there is a compression machine with 10,000,000 pounds power. In it the strength of brick columns and concrete and hollow tile structures is tested not only for primary strength but for their behavior under high temperatures.

"If the bureau could have the money it saves to the people on fool inventions, it would easily be self-supporting and would never have to ask Congress for an appropriation," says Dr. Stratton.

The bureau has tested, for example, hundreds of nostrums intended to increase the use of gasoline in automobile engines. It has found most of them useless. Likewise it has found many cements put out for leaking radiators to be harmful, although some are safe and valuable.

A task of general benefit is now nearing completion with regard to the standardization of textiles. The bureau proposes to put forth a line of scientific standards for all textile products. When a person buys a piece of cloth he will be able to hold the seller to a definite obligation as to what the cloth actually is.

Like work is being done or has been completed with regard to roofing materials, concrete, many varieties of flooring and other things.

The business and manufacturing world takes more interest than the general public in the work of the Bureau of Standards. Everything in the way of scientific standardization helps honest business, removing as it does the causes of controversy, lessening means of deception, and facilitating quantity production.

Most of the work is done for the government itself. Materials purchased for the army and navy and the departments are tested and specifications for purchases worked out. What knowledge is developed in the government tests, or those for the states, is available free to the public. Tests for outsiders must be paid for, and are made as a rule only when the public will benefit.

"The use of exact standards enters into all industries and into the everyday life of each of us," says Dr. Stratton. "It was in the government service that the need for precision was first appreciated. It is absolutely necessary for the government to demand in its work the use of accurate measurements of all kinds. The public can hardly be expected to appreciate the need for exact standards in its purchases if the government itself does not set an example by demanding the highest accuracy.

"The Bureau of Standards, therefore, has aimed to take a leading part in the education of the public in the matter of standardization, and has always maintained the closest relations with state and municipal authorities, and educational institutions. It distributes a number of charts and pamphlets particularly designed to be of service in everyday life."

Work shops and laboratories of the National Bureau of Standards in Washington. Beginning with studies of ordinary weights and measures the work there has led to searches for many seemingly simple but yet very difficult truths about such things as colors, cloth, paper, brick and gauges that measure within a millionth of an inch of absolute accuracy.

"Cutting Up Old Circus Money" IV. Old-Time Acts

By HARRY BARNET

"YOU'VE seen the equestrian statue of Jackson in Jackson Square, New Orleans, haven't you?" suddenly said "Governor" John F. Robinson one evening, when we sat in easy chairs in the spacious second floor, southwest corner room of the family home at the Terrace Park, Ohio, winter quarters of his circus, and puffed contentedly at long, black, blunt-on-the-fire-end cigars.

This room was his office. In it for many years the "Governor" planned the campaigns of his show in much the same manner that a general outlines and oversees the operations of his troops. There were many pictures and curios on the walls. Each one of them suggested to him now and then during the evening a story from the unwritten history of the American circus that for several weeks he had been telling to me as the opportunity offered.

And there is no one more able to tell that history. For seventy years the "Governor" was a tent show performer and owner. He assumed the ownership of his father's circus well more than a half century ago, and "toted" it into every part of the United States during that time, building it until in its heyday it was one of the largest aggregations in America. That is how he came by his title; he was the ruler of a wandering city. In the fullness of time he turned the show over to his son, completing three generations of circus owners in one family—something that up to this time no other circus family has done. During the seventy years of his active business life the "Governor" helped to make the greater part of the traditions that have been handed down only by word of mouth from generation to generation of the followers of the White Tops.

"How's that, 'Governor'?" I queried.

He repeated the question, and indicated a picture of the statue that hung above his great, old-fashioned desk.

"Many times," I replied.

"Well, pa's horse was the model for that statue horse that Jackson sits on," he said.

"You know, in the old days of the circus," the "Governor" continued, "every showman of any prominence at all had a trained horse—that is, the principal performers. Pa had a famous stallion, the color of old gold. His mane and tail were white. His name was 'Champion.' One of his principal tricks was walking around the circus ring on his hind legs.

"That Jackson statue is the first equestrian one representing a horse rearing without props. Jackson is in full uniform, as though he is entering New Orleans with his chapeau raised in a salute. The statue was erected by the state of Louisiana in memory of Jackson and the battle of Chalmette Plains, and the old people around Jackson Square say that the forepart of the horse is hollow. But it isn't. He stands on his hind legs perfectly balanced, and he has stood that way for many years, during all of the tropical storms, and never moved an inch.

"Well, when the sculptor started to make his statue, his idea was to put a prop under the horse, or a brace, like every other equestrian statue, and then later he wanted to leave out the brace. And he wanted a good horse for a model. After several months investigation —maybe several years, I don't remember now—he hadn't found either a model or a way to get rid of the props. One day Champion was being exercised, and reared, while the sculptor was standing in a doorway watching him. The jamb of the door made a line from the horse's feet through the body to the crest of the neck. The sculptor saw the legs of the rider and the front half of the horse, but the hind parts, and the body of the rider were behind the post. While the horse was reared that way the sculptor saw that he just shifted his weight so as to bring the center of gravity on his hind feet when he balanced for the jump. And he made the statue horse that way. It isn't even bolted down; it stands balanced.

"But people have changed since the days of Champion," the "Governor" went on, "and so has the fashion in circus acts. Of course, a good many of those old-time acts would fall flat in a three ring show—there are so many wonders going on that one of them alone could not arouse the enthusiasm of the audience that the old acts did.

"When I learned to ride, the performance always wound up with some kind of a pantomime, or spectacular production, like 'Mazeppa,' or 'Scenes from Donnybrook Fair,' and the riding acts also represented something. There was but one ring, you know, and that made the audience an intimate friend to every performer before the show was over, because they were so close together.

"Pa rode four horses at that time. He was one of the few four-horse equestrians in the world. One of his acts was named 'The Bottled Imp.' When I was a small boy, that act started a tradition among the Negroes around Booneville, Missouri, that we always carried the King of Hell with our show. And, I don't doubt but that you can find that tradition still in circulation around that town, if you find some very old darkies who always have lived there.

"In that act, pa was dressed as the devil. When he rode his four horses he would whoop and yell like the devil himself. That got the audience so excited that they started to yell and whoop with him, and the act closed in an awful fuss.

"There was a flourishing Negro church in Booneville, and, strange to say, when the members found that we were coming to town, and especially when they learned that we were to show next to their church, they went to all of the white folks in the community to try to keep the circus out.

"Now, a darkey will sell his cook stove to go to the circus in that country, and all the rest of the darkies in the town were pleased as Punch to think that we were coming. But a revival had just closed in this church, and the ones who had religion had it awful bad. Of course, they had no effect on our showing the town. To scare the unrepentant darkies, the church-going ones told them frightful tales—that the circus was a thing of the devil, and that the Old Boy himself traveled right along with us.

"Well, that stirred darkey curiosity and fear to an awful pitch. The night of the show, the band and the little cracked church bell ran a noisy race to see which could pull the biggest crowd. The devil story pulled an awful crowd of darkies to the show, and they waited and watched every act, wanting to see the devil, yet half afraid that they would see him.

"Finally, pa came into the ring, dressed as the devil, and making more noise and fuss than usual. Then the darkies began slipping down through the seats, and out under the sidewall at a terrific rate, and scampering off in the direction of the church. They'd seen the devil himself, and were seeking safety. When pa finished the act there were but few darkies left on the colored seats—we always separate the whites and the blacks in that country.

Above—"Governor" John F. Robinson, as an officer in the Federal Navy, when he discovered "Negro Lewis." This is a rare picture. Below—Jackson monument, New Orleans. "Champion," famous trick horse of John Robinson, I, was the model.

"Pa walked out toward the dressing room, and concluded to slip across the lot and look into the church. He didn't stop to take off his make-up. He stood by the window for awhile. The old preacher was going on like only an old darkey preacher can.

"'Oh, Mister Debbil,' he yelled, and danced around like a crazy man, 'come heah dat Ah may choke yo' breaf frum yo' scahlet body. Ah nevah wuz so strong wid de power uv de Lawd,' he screeched, 'an' Ah will tear yo' jaw frum yo' haid, an' slew yo' lak Ah would a lion.'

"Then all of the aunties, and old fat mammies, chipped in with amens.

"'Ah seed him; Ah seed him,' one of the darkies who had been to the show ran in and yelled.

"'Whar dat debbil? Whar dat debbil?' a lot of big darkies began to yell. 'Show dat debbil to me.'

"The aunties and mammies weaved in their seats, and prayed loud for the devil to appear that their men might annihilate him.

"Pa let them go on for a while, until they worked themselves up to an awful pitch; they drowned the noise of the band next door to them, he said. Those who had visited the circus, and saw the devil in person, got awful brave then, though they had sneaked out and joined the church crowd just a few minutes before.

"Then pa stepped into the room without being noticed.

"'Here I am,' he said, 'and I've got a bigger crowd than you have.'

"The darkies turned and saw pa. The preacher dived headfirst through a window back of him. Three or four others tried to follow. The first one was a mammy so fat that she stuck half way in the window, and hung there, squealing like a shoat fastened under a fence. Pa stood in the doorway, but no darkey would look at him, much less try to pass him. They finally got the mammy through the window, and the rest of them followed. Then they broke for the woods as fast as they could scamper.

"For years afterward, when we went into that section of the country the darkies came to the show fearfully, expecting to see the devil—they believed as much as they believed anything that he really traveled with us, and paid them a visit in their church.

"Yes," the "Governor" mused, "those were great days. Especially did the clowns have a warm personal following to greet them wherever they went. From the ticket wagon standpoint everything else around the old-time wagon show could be left behind in the last town, just so the clown—there never was more than one real clown with the show—got in on time. The clowns did 'talking acts.' They were close to their audiences with the one ring shows, and became favorites in the territory we made every year—so much so that they used to have benefits in the towns where they had the most friends. And they got a lot of extra money that way. The most famous of these clowns was John Lowlow, who was with us for years. He quoted Shakespeare to his audiences, and was, in reality, a finished Shakespearean actor. But when we got three rings, 'talking clowns' went out of business; their audiences were too far away from them.

"But one of these 'talking clowns' gave me my financial start in the world," the "Governor" went on.

"It began when I fed a bag of cats to our elephant, Boliver. He was one of the first elephants in this country, and pa was awful proud of him. We hadn't had him more than three days when he got loose. He roamed the wilderness in the South for three days before we caught him, and what he did while he was loose started some awful hair-raising tales in that country about a terrible monster that came down from the skies, and tore things to pieces in little settlements.

"I wasn't more than six or seven years old, and that day mother bought me my first suit of clothes with long pants. The coat, I remember, was more of a man's coat, but I felt awful dressed up. After the matinee I went up town and bought some cakes and candy, and when I came back to the lot I was still eating them as I walked into the tent. I passed Boliver. We carried no menagerie tent then, you know, and the animals were grouped around one side of the ring, and the seats around the other side. Boliver reached out his trunk for some of the goodies, but I didn't give him any.

"As young as I was, I had been riding for a year or more, and when I came into the canvas, pa was practicing some horses.

"'Jack,' he yelled to me, 'come over here and get ready to ride. Where have you been all this time?'

"I didn't answer him, because he worked me hard, and if he thought I'd been idling around he'd have given me a whaling before I started.

"So I stuffed what was left of the candy and cakes into the pocket of my coat, and hung it on a stake near the end of the string of animals and dens. Then I went into the ring.

"It wasn't long before I looked around, and there was Boliver, with my coat twisted in his trunk, shoving it into his mouth, cakes, candy and all. He had reached over and lifted it off the stake.

"Well, I didn't yell at him. Neither did I jump off my horse. The damage was done, and I was heart-broken.

"When pa noticed what was going on, he yanked me off the horse, and gave me a good thrashing for hanging my coat where Boliver could get it. Then he tossed me on to my pony, and gave me a double dose of practice.

"Now, I'm not a vindictive man, but I've always felt that if a man or a beast got the best of me he was about due for something. I wanted to get even with Boliver and pa. So I began to study it over.

"Our principal clown was Sam Long. He was subject to cramp colic, so his nickname was 'Colicky.' Sam was going to have a benefit that night, and, as was the practice, he tried to get up something extra. He was going to have a cat piano, a narrow box, with each side notched, and six or eight cats put in it with their tails sticking out on one side, and their heads on the other. When Sam pulled their tails they yowled, and Sam called that music.

"To be sure of having enough cats, 'Colicky' advertised that every boy and girl bringing him a cat that afternoon would be put into the show that night on a free ticket. The result was that there was nothing but cats all over the dressing tent.

"When I got through practicing, I went into the dressing tent to think about the elephant and the licking. I noticed a couple of cats squirming in a bag alongside of me. So I picked up the bag, got two or three ears of corn, and carried them into the show canvas. I stood where the elephant could see me, and dropped the corn into the bag. Then I twisted the end of it on the stake where I had hung my coat, and walked out into the ring.

"It wasn't many seconds before I heard a terrible screech and a yowl. I turned and looked at the elephant. One of the cats was up against the top of the canvas, and the other one was walking through the air, just like he was walking on the ground, and he went that way clear across the top of the canvas. For-

A Crisis in the English Mining Industry

Government's Return of Mines to Owners Precipitates Controversy That Threatens Involving All Great Labor Bodies in British Isles

By W. P. CROZIER

Manchester, England, April—(By Mail).

GOOD times in England brought us strikes and threats of strikes in the great industries, as wages were forced upward to meet the rise in the cost of living and to share in the abounding profits of the employers. The good times have gone and bad times have succeeded, and they, too, are bringing the imminent menace of industrial crises.

The cause is always the same. For the last two years wages in every industry have sprung up by leaps and bounds. In the mines, as in the textile trades, engineering, railways and the like, wages have been doubled and trebled beyond the pre-war standard. Often, it is true, these increases have not meant an advance in "real wages"; they have been given simply and solely to meet the rise in prices. Often they have done no more than raise the workingman to a decent standard of comfort from the miserable existence in which he and his family were living. But often, too, they have been based on an industrial condition, on a standard of profits, that was quite abnormal. As long as the abnormal profits were maintained, the abnormal wage-increases were secure. But now that the profits have disappeared and been succeeded by infinite depression, a momentous issue has to be fought out—whether or not, and how far, wages are to fall.

Labor declares for the most part that in so far as wages were not increased to meet the cost of living, they have not done more than establish the decent standard of daily life which the workingman and woman ought always to have enjoyed but never did until the last few years. Profits or no profits, says Labor, men and women ought not to be asked to work for less than this minimum standard of life, which ought to be a first charge on every industry. We cannot maintain this post-war standard, say the employers, and if Labor insists on it, we must just shut down. There is the crisis. The first great instance has arisen in the coal industry, in which it takes a special form.

Government "Passes Buck"

ON MARCH 31, the state "decontrolled" the mining industry. Some weeks ago it established decontrol in two important respects; it no longer fixed the price at which coal should be sold and it no longer fixed the distribution of the coal supplies throughout the country. But it was still responsible for the financial management of the industry and it was not expected to begin decontrol of this until August 31. Until that time it should, in the normal course, have continued to fix the wages of the men and the profits of the owners. Owners and men bargained not with each other but with the state. All the great increases in wages during the last two years have been granted to the men by the state. The state has imposed these increases on the owners. This was an easy task so long as the mining industry was making vast profits out of the export trade. The state pooled the proceeds of all the mines in the country, lumping the most profitable in with those that do not pay. The exported coal was sold, for a time, at enormous prices in the French, Italian and other markets, so that it was possible to sell coal comparatively cheaply at home and still to pay large increases in wages. With a surplus profit in the "pool" of many millions sterling, the government could cheerfully continue to "control" the financial side of the industry. But with the end of 1920 the picture underwent a change. January showed a loss of nearly five million pounds sterling or twenty million dollars. Thus:

	Total £	1 ton s.	1 ton d.
Net costs	34,468,733	40	3.02
Proceeds of sales	29,597,412	34	6.51
	4,889,321	5	8.51

When these results are analyzed into districts it appears that only the Derby, Nottingham and Leicester coal fields (where the output per man was highest) made any profit at all, and on sales amounting to nearly four million pounds the profit was less than fifty thousand pounds. The other fields without exception showed a loss and the greatest of all, the South Wales field, a very heavy loss indeed. These are the figures:

	Deficit £	Ton s.	Ton d.
Northumberland	238,313	6	4.81
Durham	386,756	3	3.78
South Wales	2,203,995	14	5.77
Yorkshire	749	0	0.06
Cumberland & Westmoreland	116,854	17	11.59
Lancs. Cheshire & N. Wales	776,540	9	7.39
Staffs, Shropshire, Worcester and Warwick	331,230	4	6.83
Other English counties	100,756	8	8.16
Scotland	781,226	7	4.52

With the coal industry losing money at the rate of five million pounds a month, the position of the government, and of the state as controller, was fundamentally changed. The government was in a dilemma. It might maintain the wages of the men, which make up 78 per cent of the whole cost of production. But in that case it would have to call on the taxpayer for heavy subsidies to the miner and at the present time it is frankly impossible for the state to demand from the overburdened citizen large subsidies for anything or anybody. Or it might order large reductions in the men's wages. But that would mean the most serious trouble—almost certainly a great coal strike in which the railway and other transport unions, the other members of the great industrial Triple Alliance, would very likely join. So the government chose a discreet but very unheroic course. They decided not to wait for August 31 but to return the industry to private management at the end of March. Thus they would escape the heavy financial loss and transfer it to the mine owners, evade the difficulty and danger of reducing wages and throw them on to the employers' shoulders. The mine owners recover their own at a time of heavy loss when only reductions of wages can save the situation. Evan Williams, president of the Mining Association of Great Britain, thus sums up the position:

Position of the Mine Owners

"THE industry would have to maintain itself, and owing to the enormous drop in the volume of export trade, the depreciation in values, and the depression in home industries, the position created was one of extreme gravity. Week by week from the first of January the industry had been losing money very heavily. A typical colliery undertaking had converted a credit of some thousands of pounds in December into a loss of over £50,000 in January. It seems to us that the position cannot be met in any other way than by reductions in wages. Increased revenue can only be obtained by an increase in the price of coal, and that, we consider, is entirely out of the question. We can only restore the position by a reduction in wages. The owners are in no way desirous of doing this, but it is inevitable that wages must come down if the industry is to continue to work at all. Dramatic changes have taken place in the position of collieries in many parts of the country. The owners have to bear the brunt, and they cannot continue working the collieries at a loss. There must be a decrease in the cost of production."

The employers therefore set out with the idea that wages must come down and as the basis for a new settlement they suggested that the wage rates should be settled district by district, inasmuch as the output and the profit of the mines vary greatly from one district to another. The miners absolutely refuse to agree to this solution. They demand that the coal industry as a whole should be unified in a financial sense, that the more profitable pits should be made to support the workmen at the pits which are losing money, that these unprofitable pits should be kept working so long as there is a demand for their coal; and that, in fine, a national minimum wage should be established and maintained out of a common pool. The whole industry, in the miners' view, is to be regarded as one and the work in every district, being similar in character, should be similarly rewarded.

Would Close Unprofitable Workings

THE employers, on the other hand, say bluntly that the more unprofitable mines must be shut down, with the result that the employes will be thrown out of work; the industry, they declare, can no longer be conducted on grossly uneconomic lines and every district must settle its wage rates according to what it can afford. The miners, of course, are reaching forward toward their ideal of nationalization. It is a first step toward that end if they can compel either the state or the employers to regard the industry as a whole and to legislate for it as such in respect of wages. Frank Hodges, the miners' secretary, has summed up their contention thus:

1. The only guaranty of peace is a national settlement. Local negotiations would result in infinite strife.

2. For uniform expenditure there should be uniform reward.

3. A national wages board, by a small levy upon all tonnage, could maintain poor collieries as long as the coal was in demand at all.

At the same time Mr. Hodges declares firmly that where wages advances have been granted to raise the standard of living they must not be altered, whether the profits of the owners be great or small, and that where advances have been granted in order to meet the rising cost of living, they should be maintained until the cost falls so much as to justify their removal or reduction. It is on these lines that negotiations have been conducted for some time, the owners insisting both that wages must come down and that they must be settled district by district, the men demanding that the settlement shall be national and therefore by implication that the state shall continue some measure of financial control, for it is quite certain that the mines can only be "unified" in respect of wages and profits by the state continuing to regulate the conditions and manage the negotiations. That is, indeed, one of the objects of the miners in this controversy. They have by no means abandoned their project for nationalizing the mines, and they know that if they now allow the state to withdraw entirely from the control of the industry and it reverts completely to private management, they will have lost the ground which they gained during the war and will have to begin the struggle over again.

Labor Demands Nationalization

THE miners have some ground for feeling aggrieved. The commission presided over by Justice Sankey, in the spring following the armistice, pronounced formally that the existing system of private, scattered ownership was wasteful and inefficient and ought forthwith to be altered. No one doubts that this judgment was perfectly accurate and that the system should be changed. The only question has been. What should the change be? The miners were for nationalization, the government was for grouping (or "unifying") the mines in the various coal areas in order thereby to enforce a more efficient and economical working. But now apparently nothing at all is to be done. The government, frightened by the financial losses of the industry and the extreme division of opinion among its followers and in the country, will simply hand back the industry to the wasteful and inefficient methods which responsible opinion of every sort condemns.

It is not this prospect, however, which menaces us with the prospect of a great strike or lockout. (The owners have already given notice to the men of the termination of contracts and if the men refuse to accept reduced wages in April a strike or lockout there will be.) Industry in general looks on this dispute as a test-case with regard to the reduction of wages. The railwaymen, for instance, do so. Their wages also have been raised greatly during the last year or two and now, in the trade depression, the railways cannot stand the strain. At the end of August the government will cease to control the railways and the men anticipate, with good ground, that as soon as control ceases and the railways have once more to "stand on their own legs," the managements will announce substantial reductions in wages. Had the control of the mines been continued till August 31, the two great unions would have stood together against the government and it is widely believed now that the government only decided to decontrol the mines on March 31 to escape from this joint attack.

Railwaymen Involved, Too

BUT the railwaymen are watching jealously the present troubles of the miners. They see their own interests imperiled and it is quite likely that if the breach comes over the mines, the railwaymen will intervene in the struggle. They are not in a combative mood. No part of the Labor world here is pugnacious at the present time, for the trade depression and widespread unemployment have sobered it. No one—certainly not the railwaymen—wants a great strike. But the railwaymen may think that they and their friends in other industries are being taken and beaten in detail—first the miners, then the railwaymen, then the textile workers and so on. And if they come to that conclusion, the danger is that they may think it better to stand together at once and to fight the issue out alongside of as many unions as they can gather to their side. Much depends on the sobriety of the leaders on both sides and on their power to persuade their followers that the two sides must and can agree together amicably—that it is reasonable for wages to vary with profits, after a proper standard of living has been provided for, and that the principle of the sliding scale is one of which, if it be reasonably administered, Labor should not be afraid.

There are some signs of reasonableness in the mining dispute. There is a suggestion that the mine owners may agree to limit their profits to a certain maximum, and this, if it were settled, would both placate the miners and introduce a new and startling principle into industry. We should soon hear much about an extension of that principle to other trades. We hope that neither the government nor the owners will take advantage of their present strong position to force a breach. Their position is, of course, very strong, for great stocks of coal have recently been accumulated and the present demand is very small. But if the breach is made, it is impossible to say how far it might extend or how much of British industry it might not involve in serious disaster.

Improving Farms Through the Youngsters

30,000 Minnesota Boys and Girls Engaged in Club Work

ONE of the boys in a potato club wrote to the Minnesota College of Agriculture this significant statement—

"When father saw that I was able to grow 400 bushels of fine potatoes to the acre on the same kind of land on which he grew 135 bushels an acre of rough, scabby ones, he was anxious to get my seed and to use the methods I used as a club member."

That's the kind of thing boys and girls' clubs are doing in Minnesota. Thousands of boys and girls are learning the best methods of farming and home making, and discovering that it's play. But more than that, they are inducing their fathers and mothers to introduce improved methods. Reaching the farmer through his son, might be the title of an illuminating story, written from the experiences of these boys and girls.

Perhaps no state in the Union has developed so extensively the extension work among boys and girls as the Minnesota College of Agriculture. Fully 30,000 boys and girls are actively engaged in these clubs, raising improved live stock, or corn, or making better bread. That's a tremendous educational force, when you stop to consider it.

Last year alone, the members of these clubs raised half a million dollars' worth of products. But the educational value of the work to the state can't be measured in money, according to T. A. Erickson, state leader of boys and girls' clubs.

"Let me tell you a story," Mr. Erickson said. "I went down to Sleepy Eye to a county show a year or so ago. I was looking at the calves entered by the members of the boys' club there, when I noticed an old German farmer, who seemed to be much interested in the calves. So I spoke to him about the show.

"'See those two boys holding that calf,' he said. 'Those boys are mine.'

"Then he went on to tell the story.

"'This club work has meant a lot in my home,' he said. 'My boys were dissatisfied with things. Then a teacher here started a calf club, and the boys went into that.

"'The first year the boys didn't do so well. You see, I had just ordinary cattle. Well, the boys found out that if they were to compete with other boys we would have to have better cattle. So last fall I went up to an Aberdeen-Angus sale at St. Paul. The first bull calf put up sold for $700. That looked like a fortune to me back in those days, and I was ready to go home without buying a calf. Yet I knew I couldn't disappoint those boys. So, I staid and bought a calf.

"'Then the boys went into the pig clubs, and they found that we had to have better hogs if they competed with other boys. So we bought improved hogs. They went into corn clubs, and they found that we had to have better seed if they raised corn better than that raised by other boys. So we got better seed corn.'"

Mr. Erickson stopped to let his point soak in.

"That's the way it works," he continued. "Well, one of those boys had the grand champion calf at the state fair that year, and I can see yet that farmer and his wife, standing there watching that calf with the blue ribbon. Oh, but they were proud of that boy. I happened to come along while they were standing there.

"'This is the best thing that ever happened in our home,' he said. 'We thought we were doing right when we taught the boys to work. We failed to teach them how to play.'

"I can remember those boys the first time I went down to Sleepy Eye. Why, they were so awkward, they wouldn't even go in swimming with other boys when we were out on a field trip. Lots of farm boys get little time to play, but think of it, a boy who never has gone swimming! That day these boys went off to themselves and ate their baked beans from a bag.

"I wish you could see those boys now. They are intelligent, wide awake and take an interest in everything about the farm. The boys and the father are partners, and the father says all he has to do is to watch the boys run the farm. To me, it's worth working years to develop boys like that.

"It is amazing sometimes to find the influence these boys and girls have in getting their parents to improve their methods. You can reach the boys and girls when you can't reach the parents. The boys and girls are competing with other boys and girls for prizes, and they want to know everything. A boy will study the government bulletins when the father won't. Take the case of these potato diseases. The ordinary farmer doesn't know anything about them. But the boy in the potato club knows all about them, believe me, and he knows how to prevent them.

T. A. ERICKSON,

State leader of boys and girls' clubs in Minnesota, who has built up an educational army of boys and girls.

"I was up at Mora, Minnesota, recently and was looking over the fine pens of hogs there, and this is what they told me. 'The most valuable thing that ever happened here was the beginning of the pig clubs.' All the fine herds started then. Down at Anoka the other day, three farmers told me they started to build pure bred herds because their boys got interested in a calf club. Down in Todd County, the owner of a fine bunch of hogs said, 'That's what we started when Harold was in the pig club.

"The same thing is happening in all lines. Now, take the case of bread. The bread-making clubs have been among the strongest of the projects. Five thousand girls are engaged each year in these contests. That means 5,000 girls learning to make bread in accordance with the best methods.

"When we started this work six years ago Minnesota ranked fifth among the states of the Union in the amount of bread baked at home. The Department of Agriculture made a survey of the states in 1913-14 to find out about home bread making. Then it made another survey in 1918-19. On the second survey Minnesota stood first among the states of the Union in home bread making, largely due to these bread-making clubs, according to the Federal Department.

"A large yeast company, finding its sales jumping so rapidly in Minnesota, sent representatives to the state to seek the reason, and arrived at the same conclusion. This company sells more dry yeast in Minnesota than any other state in the Union."

Especially in the case of persons of foreign descent, are the boys and girls' clubs agencies of great power. When it comes to Americanization, Mr. Erickson backs the members of his clubs for first place. At the university farm school, they tell a story of a county in Northern Minnesota, where the settlers were about to give up their homesteads.

The population was foreign. In fact, English was spoken but rarely in the county. In one school, with 84 pupils, there were 18 nationalities. The settlers, dissatisfied with meager returns and the hardships of the north country, were ready to quit. Here was a fertile field for the agitator.

Then some one started a pig club. The boys and girls caught the fever, and borrowed money to buy more pigs. The boy who owned the best pig that first year came down to the state fair with his entry, his expenses paid by the state. This boy lived twenty-five miles from a railroad and felt he was going off on a trip to a foreign country. But when he got back home, he had a lot of new American ideas to tell his companions.

That pig club gave the farmers a new attitude toward the government, the field men of the extension department reported. Incidentally, it started a perfect influx of blooded hogs to that county. There wasn't a hog in the county when that first pig club was started. Now, the farmers couldn't be persuaded to leave; their live stock is too productive. One farmer is buying a quarter section of land from money brought in by his hogs.

Incidentally, a little Finnish girl, Mayme Jyring, 13 years old, of Sandy, Minnesota, was the champion potato grower of the boys and girls' clubs of the state in 1919. She raised 664 bushels of potatoes to the acre, the record crop in the history of the state, and made a profit of $528. The Finnish Government has obtained a picture of the Minnesota girl, so far has her fame traveled, and is to publish her story in Finland as an inspiration to boys and girls there.

The extent to which this work among Minnesota boys and girls has grown may be seen from a few significant figures compiled by the college of agriculture. Every year, more than $40,000 is spent in prizes to the boys and girls participating in the different contests, and every penny of it is worth while, according to the state officials who make the appropriations. Boys and girls' club work is one thing that gets unqualified support when it comes time to make appropriations in Minnesota.

A thousand boys and girls are given free trips to the state fair, a short course at the college of agriculture, or the International Live Stock Exposition every year. Bankers in the state, promoting the calf and pig clubs, loaned $100,000 to boys and girls last year, bringing in new and improved blood to hundreds of herds.

But these boys and girls, besides engaging in contests and learning new methods, are getting practical results as farmers and home makers. The boy is required to keep an accurate and systematic record of his work, showing his expense and his income. At the end of 1920, reports of the boys and girls completing the year's work showed the total value of the products to be $321,275.48, while the total costs were but $147,426.82. In other words, the boys and girls made a profit of $173,848.66, which isn't bad farming.

Counting the products of those who did not complete the year's work by sending in the final reports, Mr. Erickson put the value of the year's products at fully $500,000. So much for accomplishment in the mass. Of individual achievement, he has stories galore, stories eloquent of the personal value of this work to the boys and girls who are to be the farmers and home makers of tomorrow.

"There was the case of Virginia Scanlon," Mr. Erickson said. "Her mother died when she was five, and Virginia, who lived on a farm down at Belview, Minnesota, missed some of the things that play their part in the lives of other girls. One day she got the idea that she wanted to enter the baby beef contest. So she picked out a steer and fattened him for the Junior Live Stock Show held at South St. Paul.

"That calf won the Hereford championship and was the second best calf in the show, winning the reserve grand championship. Her animal, a yearling, sold at the auction after the show for $558.90, or 46 cents a pound. With prize money, this made her return $625, not so bad for the first effort of a girl. But more significant still, the venture opened up a new vision to her, and gave her a new outlook entirely.

"Iver Barnell joined one of the corn clubs and now he has become a seed corn expert in his own right. In fact, he has established a business in seed corn at his home at Sacred Heart, Minnesota. He is only sixteen years of age, but last year he sold $500 worth of seed corn on the side, as it were, while going to school and attending to other work.

"Albert Schultz, a 15-year-old boy of Rochester, thought he would give up his chicken raising, but wrote in that he got too lonesome without his chickens, and had to buy some more. Of 88 hatched chickens, he raised 79, won the state championship and made a net profit of $300 on his flock. His costs were $72.

"Up at Grand Rapids, there is a potato club, whose average yield has never been less than 316 bushels an acre, and last year the members averaged 400 bushels an acre. Clarence Bunnell, of Grand Rapids, who won the state championship in growing potatoes, got a yield of 486 bushels of potatoes to the acre."

The Junior Live Stock Show, held at South St. Paul each year under the auspices of the college of agriculture and the Minnesota Live Stock Breeders' Association, is a unique institution. There, boys and girls who have fattened their own calves gather with their prizes, and have a live stock show of their own, quite like the grown-ups. More than seven hundred boys and girls took part in the preliminary contests for the show last fall, and more than a hundred animals, selected from the contestants, appeared at the show.

MISS HILDA THURSTON,

Blooming Prairie, Minn., winner of state bread-making championship '20

After the show, there is a public auction, and the prize winners command the highest prices. Carl Oelke, a Faribault boy of 13, who won the grand championship last year with an Aberdeen-Angus yearling, received 80 cents a pound for his calf, or a total of $854.40. Consider what that means to a boy, and you'll see the value of the show.

But the stock show is only one feature of the work. There are thousands of exhibits at the fairs, culminating in the final contests at the state fair, with the free trip for the winners. For instance, here are some figures for 1920 that will show the amazing extent of this work—club members put on 1,951 club exhibits at the state fair, 6,250 at the county and district fairs, and 12,468 at the community fairs. School fairs are held, hundreds of them, where the boys bring in their potatoes and the girls their bread, and prizes are awarded. Boys and girls join in the exercises on achievement days, the winners of the contests telling how they accomplished their results, and parents as well as children benefit. Indeed, it is a new kind of rural school which has come with the institution of the little school fair and the boys and girls' club work.

Clubs have been organized throughout the state in a dozen different projects, so extensively has the Minnesota system been worked out. There are corn clubs, and pig clubs, calf clubs and poultry clubs. There is a garden club, including city and country children, which had 14,000 members during the war. There are more than 3,000 girls in canning clubs, who last year canned products worth $34,000, making a net profit of $23,000. Dairy clubs raised products worth $74,000, and having a net value of $34,000. And so on down the list.

But money can't measure the products of the clubs, according to Mr. Erickson.

Doing a Work Whose Value Is Inestimable

1. Virginia Scanlon, Belview, Minnesota, said she could raise a prize beef steer with the best of the boys. She won second place at the Junior Live Stock Show, getting $625 for her efforts.
2. Ruth Bohn, Winona, Minnesota, is a most effective advertisement of the value of boys and girls' club work. She won the canning championship in 1919, and was captain of the winning team last year.
3. Carl Oelke, 13, of Faribault, Minnesota, cried when the judge first put his calf in 16th place. Later the judge began moving it up; finally, it landed in first place, and sold at 80 cents a pound. Hence the smile.
4. Verne Stiehl, Albert Lea, Minnesota, and his champion dairy calf.

"Cutting Up Old Circus Money"

Concluded from page 12

tunately, neither one of the cats was hurt, but they didn't linger around the show after they came down.

"In a minute or two I walked along in front of Boliver, sort of gloating over what I had done. He watched me, and when I got pretty close, he made a swipe at me that would have killed me if I hadn't dodged it. He never did cease to bear malice against me. If I walked along on the outside of the canvas for years afterward, and my shadow fell across the sidewall, that elephant would make a charge and a swipe at it.

"Well, 'Colicky' told pa about the cats, and I got a licking—in fact, there seldom was a day that I didn't.

"We had no candy and lemonade butchers in those days. 'Colicky' sold lemonade and candy while he wasn't in the ring, both outside and inside the canvas. Pa charged him nothing for the privilege, though it was a valuable one. And he made his lemonade from citric acid. But 'Colicky' was stingy, and I knew if I could hit him in the pocketbook I could hurt him worse than in any other way, and get a more satisfactory revenge for telling about the cats.

"Next day I borrowed a dollar from mother, went up the street and got an old Negro mammy to bake some gingerbread for me; and I also bought some real lemons.

"When I got back to the lot I made real lemonade, and set up my stand. I sold it for five cents a glass, and threw in a slice of gingerbread as lagniappe. 'Colicky' sold his acid juice for a dime, and gave away no gingerbread.

"The result was that I had to buy all the lemons in town to supply the demand, and I cleared $40 the first day. Next day I went into the business as a regular thing, and took all the trade away from 'Colicky.' He complained a lot about it, and finally sold out to me for $30. Then I bought a horse and wagon, and in two months I had earned $600. Since that time I've been in business for myself.

"Of all the acts, however, that ever traveled with circuses in the United States, we were the first show to have a famous Negro bareback rider. He never had any other name than 'Negro Lewis,'" the "Governor" continued, though I couldn't see the connection between cats and Negroes at the time. But the conversation is here set down as it took place, because this is an interview, and nothing else.

"When I was an officer in the Federal Navy during the Civil War, we were ordered to put a check on the practice of guerrillas firing into our boats on the Mississippi River, by landing and burning plantation buildings.

"One day, near Island 63, we were fired upon. We stopped at the next plantation, and set the buildings afire. On our way back to the boats, I glanced into a burning cabin and saw a small colored boy asleep in the ashes in the fireplace. He had nothing on but a cotton bag, with a couple of holes cut into it to put his arms through, and one hole for his head. He was probably about three years old.

"I didn't want him to be burned so I took him in my arms, and shook him. He followed me all the way to the boat, and aboard it. There was some argument about keeping him; no one seemed to care anything about him. So I said I would take care of him. When I left the service and went back to the circus, I took Lewis as my servant. One winter I was training a Shetland pony for a little white boy to ride. A cold, nasty morning the boy failed to show up, so I wanted Lewis to run out into the training ring, and jump up on the pony. But at the start, do everything I could, by punishment, by fear, pleading and jollying, positively I couldn't get that boy to run. He didn't know how to run, and apparently I couldn't teach him. He was the most awkward thing I ever saw.

"I talked the matter over with some of the performers practicing there, and we called Lewis to us. We told him to take off his shoes, and we gave him a pair of pumps to put on. When he got them on we told him to run out and jump on the pony, but not to use too much exertion, because there were springs in the pumps, and they were so strong that if he used very much exertion he would go up through the roof of the ring barn, and probably never come down again.

"Well, we started the boy off, and the pony off, and, by George, he went out to that pony like a deer, and grabbed the surcingle. Sure enough, he went clear over the pony, and landed on the outside of the ring, gave one bump, and landed against the side of the barn. After that we tried for five or six hours to get him to run again, but he wouldn't unless he had the pumps on. He believed there were springs in them. Of course, there were none, but the thought gave him confidence and his start at riding. Afterward he became one of the most skillful bareback riders that the circus world ever has known, and the only Negro rider I ever knew.

"Lewis stayed with my show for ten or twelve years. He went to Europe, and rode in some of the biggest circuses there. He was gone several years, and during that time a Hungarian baroness fell in love with him, and followed him all over the continent. But Lewis displayed unusual strength of character. He remained true to his wife, who was a colored minister's daughter living in Zanesville, Ohio.

"But he couldn't stand prosperity. At one time he was quite wealthy, and had several fine ring horses. Every circus in Europe wanted him. But he dissipated, and got rid of his wealth and his health. Then he returned to the United States. I found him in New York, a perfect wreck; not a dollar to his name, and in the last stages of consumption. I bought him some warm clothes, and paid his way to Zanesville, so he could be with his wife and his children. Within a few days after he got there he died."

This is one of several stories by Mr. Barnet, on early circus life. The next will appear in an early issue.

The Magic Ministry of Mud

POOLS of brown, brackish water where the bitter oak leaves steep in the autumn; pools of clear cold snow water where the first clouds of Spring mirror themselves; and all around them Mud. Mud when the Autumn rains fill the water holes to keep the earth from thirsting through the winter; Mud when the returning sun unlocks the icy doors—doors which give off rusty creakings in the first notes of the purple grackle.

Blessed be Mud!—it is the nursing mother of the year's new life. Indeed, they say that if one follows words far enough toward their source, the word Mud will be found to spring from the same idea as Mother, the generatrix of life.

Of what magic ingredients Mud is made! When first Mother Nature sought to make this fruitful mixture, she had a recipe that no one but she could follow: First, take one sun and set it shining day on day until the air is brought to the right temperature. Then take one earth and turn slowly before the sun, being careful not to turn it oftener than once a day, until the earth begins to radiate the solar rays. Then take a skyful of clouds, press them gently of their rainy juices and sprinkle the earth liberally; stir till dry.

That is all that is required in this simple recipe for Mud. A Sun, a Planet and a Meteorological system tolerably complete, and any one may easily produce a mud puddle.

A very useful article is Mud. It is the first mortar; the art of building may be said to have grown out of mud. Wasps first turned it into cement; birds used it as foundations and anchorage for their nests; human pioneers daubed it in the crevices of their log huts and plastered their chimneys with it as protection against fire; it was from mud beginnings, indeed, that the great cathedrals began to rear their spires into the sky. Our modern motor roads are built of marl, which is an aristocratic name for mud.

But best of all, Mud is the safe deposit of the year. Nature is a wise old dame, though she put all her eggs in one basket, but that basket is the wide, wide world. And it is a mud basket after all. Spring begins anywhere from September to November, not, as many think, in April or May. For from September through November, Nature gathers the myriad eggs out of which the Spring shall come, and packs them away in mud. Hers was the first and remains till now the only perfect cold storage system, wherein a failure of refrigeration means not loss but gain.

One confesses that one has not gathered the statistics on the subject, but all the seeds of all the things that grow from seed are gathered by the winds of Autumn and given over to the custody of the clinging arms of Mud, which gathers the seeds in motherly, and folds them safely till the sun-up of the Spring, when she dresses them in stalk and foliage, brightens them with blossom and sweetens them with woodsy odors, and sends them forth. The magic ministry of Mud!

Mud is the yielding of Earth's heart to her lord the Sun; he makes her to bloom in the ardor of his fire. Yet like all lords of virile nature, his touch would sere and harden were it not transformed by maidenly clouds into a light that is tenderly bearable, fitting it to be the sire of all the life that lies sleeping in the seeds. Like all the yieldings of modesty, Mud is protective even in surrender.

Give then to Mud its honor. It is a mystic mingling of three spheres, the earth, the sky, and the solar heavens. Beautiful as is the Moon, she has no such mellow substance as Mud. Wonderful as is the Sun, yet for all his lordliness, he is forever forbidden the blessing of Mud. But this favored planet of Earth is the Mud Star. Therefore are the trees tall and billowy with foliage, verdant bouquets on the bosom of the world. Therefore is the grass green, a strongly woven carpet upon the floor of the soil. Therefore is wheat brown, and bread sweet, and roses red and the soil mellow—because basic among natural industries is the production of Mud.

What a cosmic joke it would be on our perceptions if our dislike of stepping in mud were really a subconscious sense of its sacredness to life! For what the seers see, all men dimly know; what the poets sing, all men dimly feel, and at least one seer, a poet, too, has said:

" 'Tis not in the high stars alone,
Nor in the cup of budding flowers,
Nor in the redbreast's mellow tone,
Nor in the bow that smiles in showers,
But in the mud and scum of things
There alway, alway something sings."

Pomona Cleans Up Movies—Restores Sunday

A Town of 14,000, Near Hollywood, Too, Biffs Vulgar Dialogue and Lurid Sex Plays by a Very Simple Expedient; Screen Beauties Fizzle

POMONA has done it. Pomona has shown itself to be as "intolerant" and as "bigoted" and as "narrow" as may be necessary to preserve the decency of an American community. Pomona has voted

"AN ORDINANCE

making it unlawful to keep open any theater, motion picture theater, public dance hall, pool or billiard hall, skating rink or other place of public amusement within the City of Pomona, on Sunday. Provided, that said ordinance shall not apply to programs, concerts and entertainments given by religious, benevolent, fraternal, patriotic and charitable societies, or other societies of like character where no admission is charged."

This is the answer of Pomona, California—by no means a Puritan community, by no means given to the "blues"—to the forces that ripped Sunday decency to shreds and then turned on the public opinion of Pomona and said, "What are you going to do about it?"

For, you see, they thought they had public opinion with them. The anti-American forces seldom become bold until, after a long preparatory course of propaganda, they think they have public opinion with them.

And in Pomona they did have a certain proportion of public opinion, nearly 50 per cent. The vote was 2,079 for the kind of an American Sunday the ordinance represented, and 2,025 against it. The margin is 54 votes. *That is more than five times the number that could have saved Sodom and Gomorrah.*

Pomona's action is something of a wallop, because the town is only 14,000 in population and is within "the sphere of influence" of the great motion picture center of California. No one ever expected Ponoma to raise her hand against the pace that is being set by "the Fourth Largest Industry" in the land. Pomona wouldn't dare!

Maybe, under ordinary circumstances, Pomona would not have dared. But there are some things that even a "liberal" community cannot stand. Pomona likes fun. It had three movies and vaudeville houses which always played to capacity audiences. It was a "good show town." Until a short time ago the theaters there had been in the hands of Pomona people—home folks who didn't have the nerve to shove indecency before the eyes of their neighbors.

POMONA'S experience tells one thing: that commercialized indecency in the amusement world fears the restoration of the American Sunday just as much as it fears the erection of a community censorship. In Pomona, the theatrical ring threatened that if they could not go the limit on Sunday, they would close down on week-days too. Sunday is both the goose and the goat; goose that lays the golden egg for the producers of vileness; goat of all the propaganda to make the people think that decency and the "blues" are synonymous. The Pomona Punch delivered at the polls is an object lesson to a number of indignant and apparently helpless communities. Pinch them in their Sunday profits and watch them wilt.

And then the situation changed somewhat. Gore Ramish and Sol Lesser came along and bought out two of the three theaters. Gore Ramish and Sol Lesser do not live in Pomona, but they are able to exert a great influence on a number of places where they do not live, because they own a chain of theaters on the Pacific Coast.

With the change of ownership certain other changes occurred. The price of theater tickets went up first. Then came a series of lurid sex shows, such as had never been seen in Pomona before. A series of vile vaudeville dialogues followed them, such as had never been heard in Pomona before. Pomona people went to their theaters, expecting to be "amused," and as the audiences had formerly been composed at least one-third of children under 16, lots of fun was expected! But instead of amusement came amazement. What did these men mean, setting those scenes before children? What did they mean, bringing on all that filthy talk for young girls and their mothers!

The manager of the vaudeville theater—a non-resident, of course, representing Messrs. Ramish and Lesser—was called before the city council and publicly reprimanded.

Public officials and welfare workers began to notice new manifestations in the conduct of young boys and girls, and the investigations led straight to the new class of plays that had come to town.

POMONA is not a Puritan community, but it does illustrate the statement that if you want the old Americanism that made New England a sturdy liberator, you must now go to the western coast. The American conscience and the American sense of what is right and fit have moved west, they say. It may move back east again. Even in New York there is a silent host that has not acquiesced in the de-Americanization of that city. The spirit of Pomona may yet happily be seen in the Bronx. It is a fight, but it is a fight that can be won.

There was protest, of course—the helpless protest of the decent public who can simply say, "It isn't right; such things should not be allowed!"

The break seemed to come with a display of religious antagonism on the part of the theater management. It had always been the custom in Pomona whenever a public function, like graduation exercises, fraternal society home-talent show, or similar entertainment was given, to hire one of the theaters, and the theaters were always at the disposal of the people. So when there came revival meetings to Pomona and the interest grew, it was decided to hold noon-day religious services in one of the theaters.

The management was approached to make arrangements for the meetings, but the committee of citizens were thunderstruck to hear that the theater was denied them. They were told that not only could they not have the theater that time, but unless the churches stopped attacking the character of the pictures given at the show houses they need not expect any favors from the theaters in the future. There is something very characteristic about that ultimatum.

Pomona at last had its eyes open to the kind of force it was up against. It saw the whole scheme from beginning to end. The question went back and forth, "Who's running Pomona, anyway? Who has got hold of our town? Are we going to put them out, or are we going to let them put us out?" Pomona's liberalism began to tighten from that moment.

An initiative petition was circulated, the legal machinery set in motion; Pomona was prepared to deal with the anti-American forces in an orderly way.

It was a great campaign. Hollywood poured out its studio beauties to win Pomona back to normalcy. A number of dirty tricks were played, as is always so when a certain force in this country is antagonized. But the campaign went on.

It was conducted by two organizations—The Civic Betterment League, which was in favor of the ordinance, and The American League for Freedom, which was against it. The Civic Betterment League was the organ of the decent business men of Pomona. The president was a merchant and the secretary was a real estate dealer. It was financed by contributions from the churches and citizens who believed in a clean town.

The head of the American League for Freedom was the manager of the theatrical houses of Gore Ramish and Sol Lesser. The secretary was the manager of one of the theaters owned by Gore Ramish and Sol Lesser. Where its finances came from no one especially inquired, because everyone thought he knew.

Now about the Pomona newspapers—where did they stand? Well, for once, the forces represented by Gore Ramish and Sol Lesser did not have an easy getaway with the newspapers. This may not be wholly due to the newspapers themselves; there was a peculiar set of circumstances in Pomona just then. You see, the business men who advertised in the papers were in the Civic Betterment League; and the theatrical advertisers were in the American League for Freedom. The newspapers immediately rushed for neutral ground. It was rather a novel situation, that advertising should be so nicely balanced. In the great cities the forces represented by Gore Ramish and Sol Lesser, control 85 to 95 per cent of the advertising, thereby prohibiting the poor newspapers from supporting decency or even remaining neutral toward it.

The old arguments were used, of course. The "personal liberty" plea was lugged out of the old stockroom of previous "wet" campaigns, and worked to death.

The defenders of "freedom" hysterically told the people that if the ordinance passed there would be no more Sunday bathing, automobiling—no train service, no mail, no cigar stands, no drug stores. It was a doleful picture they drew. Anon they waxed heroic and declared the proposed ordinance to be a dastardly conspiracy to wreck the nation.

Gore Ramish and Sol Lesser, be it said, were represented in the campaign by people not of their race, but the Civic Betterment League, apparently desirous that there should be no confusion on that point, prepared a cartoon showing a Jewish gentleman wearing a halo and bearing the label "Till after election."

The Saturday night before election the movie studios at Hollywood poured out a small army of screen beauties who invaded Pomona in 50 automobiles. These light-hearted damsels chided the folk of Pomona on their old-fashioned ways. This was probably deserved, for there are still in Pomona hundreds of mothers of families who do not smoke cigarets at the family supper table. "Take the 'moan' out of Pomona and keep the 'sun' in Sunday," was the slogan of these women. They had their lines very well prepared.

And there was a great meeting in the interests of Gore Ramish and Sol Lesser, a very great meeting, and the Municipal Band, and—who do you think?—why, Doug Fairbanks, Wallace Reid, Jackie Coogan, Anita Stewart, and a lot of others who tried to pooh-pooh Pomona out of the idea of making the town clean. And who else do you think?—why Rupert Hughes!—you know Rupert Hughes, the author. He is under contract with Goldwyn, you know, another Jewish gentleman, and it was only natural that he should oblige. But he hardly seemed to be in the right place after all. Rupert didn't make a good argument—how could he? But it was a great meeting and it drew a monster crowd, with Anita and Douglas and Rupert and everybody, and with Gore Ramish and Sol Lesser discreetly absent.

The people of Pomona had a meeting too, but it wasn't so large. There were only the people of Pomona present, you see—no great movie stars to attract the public. Besides it was raining, and meetings for the public welfare always suffer from bad weather, as you doubtless have observed.

Well, the vote came, and Pomona won by 54.

Of course, there are threats of what may yet be done. Gore Ramish and Sol Lesser, through their representatives, have announced that they may take their shows right out of Pomona and leave the town flat! If they can't have shows on Sundays, they won't have shows on week-days! The answer to that is the installation of moving picture apparatus in the churches, and the fitting up of a theater in a Y. M. C. A. building.

Pomona is also told that the ordinance is unconstitutional—a trespass upon personal liberty. But people with sense know better. There is such a thing as personal liberty and there is such a thing as public rights. People have the liberty on Sunday to conduct themselves personally in any manner they like, so far as the fact of Sunday is concerned. They can fish, work in their gardens, tinker with their cars, ride, swim, play games—do anything that would be within their personal rights at other times.

But there is such a thing as public rights too. The right of an American community to a Sunday that is not destroyed as a day of rest and recreation by the commercialized activities of a bunch of people who do not believe in Sunday and who want to abolish Sunday—the right of American people to protect their own day and to maintain its character, is undisputed, and is written into the laws of most of the states. Personal liberty to the limit consistent with public rights—that is constitutional. Pomona has exercised its constitutional privilege as citizens of an American and Christian Republic to preserve its public rights on Sunday.

THE terrific reaction which has followed the use of the movies, the press, and the stage in propaganda derisive of the American Sunday, has been one of the most impressive recoils of this generation. The crowd of foreigners who control the stage and the movies overstepped their bounds, they imposed on good nature. Americans are now ready to practice a little intolerance; that is, to be less and less tolerant toward influences that are manifestly bent on turning the United States into a lower European state of thought.

The idea is spreading. What Pomona can do, other towns can dare. The town of Laverne, four miles from Pomona, has drawn up an ordinance which will forestall the establishment there of a theater known to be destined for the control of the same Sunday-defying forces which brought Pomona to an issue. And all about that region there is a feeling that the country still belongs to the people, if they have interest enough in it to insist upon it.

Government Success on Waterways

Barge Lines on Mississippi and Warrior Rivers Show Profit for First Time in History of Revival of Shipping

M. J. SANDERS, Federal manager of the Mississippi Warrior Service since its inception.

THE largest and most important experiment ever made in inland waterway transportation—an experiment which has been watched not only by every state in the Union, but by every civilized nation on the globe—has been brought, in these first months of 1921, to the first stage of success by returning a financial profit. The commercial, scientific and transportation study results have not been tabulated; so far only the money end of the experiment has been considered; but what has been done must be of tremendous influence on all forms of transportation henceforth, and especially on the transportation systems of those states and nations which possess navigable inland waterways.

The experiment was and is the revival of inland waterway traffic, north and south on the Mississippi River, and east and west along the Gulf of Mexico Coast between New Orleans, Louisiana, and Birmingham, Alabama, via Mobile and Mobile Bay. The result is embodied in two reports, one issued late in March from the headquarters of the Federal Government Mississippi-Warrior Barge Line Service at St. Louis, and the other presented about the same time by J. R. Hagan, agent of the Warrior River division, stationed at Mobile. The first report says:

"For the first time in its history, the government-operated barge lines on the Mississippi and Warrior rivers show that receipts exceeded expenditures for the month of February."

The report issued by Mr. Hagan says:

"Warrior River barges handled almost twice as much cargo in 1920 as they did in 1919, exact figures being 124,797 tons for 1920, and 73,733 tons for 1919."

Following these announcements, the Federal Government is now installing on the Mississippi River new towboats and barges, all constructed of steel, at a cost of $6,500,000 and new towboats and barges on the Warrior River division, with self-propelled towboat-barges for operation between New Orleans and Mobile, the whole cost for this division being rather more than $1,500,000. General Frank T. Hines, who, until his recent resignation from the army, was chief of the inland waterways service, estimates that, with this equipment, and the present rate of growth of business on these lines, net earnings in the neighborhood of $1,000,000 a year, or 12½ per cent on the money invested, will be obtained.

This is the largest investment ever made in any inland waterways project by any government in the world; the hauls are the longest of any inland waterways service yet attempted, and the cargoes on the new barges handled by the new towboats—all of which will be in operation by the time this is published—are the largest ever offered for such transportation lines. But the great big fact of national and international interest and importance is that Uncle Sam has proved that inland waterways traffic can be carried on along large lines at a profit. The law giving the railroads equal long and short-haul rates when in competition with water-borne traffic, which some 30 years ago retired the big packets from the Mississippi River and tributary streams, is still in effect, but new methods of handling inland waterway freight have met this condition, and the success of the barge line is now a fact.

Remarkable as is this result from an economic point of view and from the angle of national interest in transportation, it is of still greater value to the individual shipper, to the manufacturer, and to the 29 states of the Mississippi Valley, all of which are tributary to the great water lanes of that vast area, for the freight rates by this barge service are from 20 to 25 per cent lower than rail rates for the same distances, and, in some instances, as much as 30 per cent lower. The time in transit is virtually the same; occasionally, the barge time is better than rail time, and, with the new equipment, schedules of arrivals and departures at all the ports along the Mississippi will be even more regular than freight train schedules.

Chicago's "Panama Canal," for which $20,000,000 has been appropriated, to connect Lake Michigan with the Mississippi River, was started in March under the supervision of the Division of Waterways of Illinois. This canal will follow the route of the Chicago Drainage Canal and the Illinois River for 65 miles from the lake to the river. The channel ranges from 200 to 270 feet in width, with a minimum depth of nine feet at low water. This means that, with the completion of this canal, the Gulf of Mexico will have direct waterway connection with the Great Lakes, and thence eastward, through the canal and the St. Lawrence to the Atlantic. All that is now needed is the completion of the Inter-coastal Canal, running from a point above Boston, to the mouth of the Rio Grande, and the endless chain of inland waterways will be complete.

The statement that receipts of the barge lines exceeded expenditures in February, coming at a time when the equipment was old, worn out and far from complete, was considered in all transportation circles as the more significant because of the contrast with the railroad situation. The recent slump in traffic throughout the country has affected seriously the earnings of the railroads, in spite of the increases in both freight and passenger rates, granted to the rail lines last year. Now comes the barge line, operating at least 20 per cent under rail rates, and with only antiquated equipment, and shows a profit. Despite the comparison with the business of the rail lines, the success of the barge line does not lie in any competition with or fight on the railroads, but in its complete co-operation with them, co-ordination at river and rail terminals at all the principal shipping points, and the extension, through a proper division of rates, of the territory the barge lines may serve.

The success of the experiment is well epitomized by Brigadier General Frank T. Hines, formerly chief of the Inland Waterways Service, when he said to the writer:

"The whole undertaking, often referred to as 'an experiment,' contained interesting possibilities for peace-time as well as war-time commerce. And it actually was experimental, at least so much so that no organization outside of the Federal Government could be expected to take these projects in such an uncompleted stage and carry them to a point where it could be definitely shown whether or not they were profitable.

"The questions to be answered were:

"Is waterway transportation actually cheaper than rail transportation for moving certain classes of merchandise?

"If so, what are those commodities, and how much cheaper can they be handled over rivers and canals?

"With cheaper water rates, cannot communities located away from the river banks also share in these reduced tariffs?

"All three questions have been answered, the first and third in the affirmative, and the second in detail. The service thus far provided includes operation of towboats and barges on the Mississippi River between St. Louis, Memphis and New Orleans, with joint river and rail rates between New Orleans and interior points in Arkansas, Illinois, Missouri, Indiana, Iowa, Kentucky, Michigan, Minnesota, Ohio, Tennessee and Wisconsin applying through Memphis and St. Louis.

"There is also provided out of New Orleans another service along Mississippi Sound to Mobile Bay, thence up that bay to Mobile and from Mobile up the Tombigbee, Warrior and Black Warrior rivers to Port Birmingham, within a few miles of Birmingham, Alabama, with joint through water-rail rates to the southeast, including Atlanta, Chattanooga, Selma, Montgomery and other points. Weekly sailings are made between St. Louis and New Orleans. Downstream trips, with as much as 10,000 tons of freight, are made in eight days, and upstream trips, with 5,000 tons of freight, in 15 to 18 days. The new type of towboats and the new barge equipment will reduce this time largely and, if sufficient business is developed, sailings will be made twice each week from both New Orleans and St. Louis."

Above—The government steamer Barrett, and three ofthe present-type barges operating on the Mississippi River. Both steamer and barges will be replaced by modern all-steel towboats and larger, all-steel barges.

Below—All-steel, fireproof towboats built to replace the wooden steamers now used for handling barges on the Mississippi River. These are the largest and most powerful towboats ever built for inland waterway service anywhere in the world.

The new equipment mentioned by Brigadier General Hines is the largest, most powerful and most modern yet devised for use on inland waterways. Three types of towboats and two types of barges are to be used on the Mississippi-Warrior river service. Two of the tugs are for towing exclusively, and the third is a power-barge, of large capacity, propelled by steam and capable of towing five or six barges as well as handling cargo on its own after-decks. The three types of towboats are in three distinct services. The largest and most powerful is to be used in the Mississippi River, one of them, the "Natchez," having been delivered this spring and the others probably in use by the end of April. A smaller type of the same kind of towboat is to be used on the Alabama rivers, while the self-propelled barge-towboats will be installed between New Orleans and Port Birmingham, crossing the Gulf of Mexico between New Orleans and Mobile Bay. Large steel barges have been constructed for use, with the present steel and wooden barges, on the Mississippi River, while wooden barges will be continued in use on the Tombigbee, Warrior and Black Warrior rivers in Alabama.

Forty steel barges for use on the Mississippi have been delivered and are in service. They are of the deep-hold, cargo-box type, 230 feet long, 45 feet molded beam, and 11 feet deep, with a cargo box 184 feet long, 37 feet wide, and nine feet above the deck. The hull is divided into eight hold-compartments, and the total cargo capacity is about 125,000 cubic feet, or 1,800 tons on an eight-foot draft. Some of the barges have been fitted to carry liquid cargo in the wing compartments, which have a capacity of 15,800 cubic feet. Others have been equipped with full decks, with portable sections at the main deck level, so that cargo may be carried in the boxes independent of the holds. These combinations make it possible to handle all kinds of freight from dry goods to molasses. Six powerful towboats of the tunnel-stern type are being provided for the operation of these modern barges on the main line on the Mississippi River. One of these, the "Natchez," is in service; a second was ready for work on April first, and four are to be delivered soon to the War Department. These boats are provided with the same size and type of engines used by the Shipping Board in the equipment of deep seagoing vessels of large tonnage constructed at the Hog Island yard, and these are the largest and most powerful boats ever built for inland waterway service in any part of the world.

These towboats are 200 feet long, 40 feet beam and 10 feet deep, with draft of six and one-half feet. Constructed throughout of steel, they are virtually fireproof, and are given ample strength by a system of trusses and bulkheads. Double bottoms are fitted under the engine and boiler rooms. Oil will be burned under the boilers, and the oil tanks on each towboat have a capacity of 12,750 cubic feet. Water tanks with capacity of 1,460 cubic feet are built in on each towboat. Old Mississippi River steamboat men declared when plans for these boats were first shown that they would be unwieldy and could not be handled to advantage in the current of the Mississippi River. This seeming disadvantage was overcome when the designers provided two sets of rudders, two forward and two aft of the propellers, enabling the boats to be turned almost in their own lengths.

The six towboats for the Mississippi River have been named "Natchez," "Baton Rouge," Vicksburg," "Memphis," "St. Louis" and "Cairo." The "Barrett," an old government river packet, has been rebuilt, and will be

(Concluded on page 12)

The Sales Turnover Tax

THE proposition to substitute what is known as a "sales turnover tax" for the present excess profits tax is being energetically pushed by means of widespread and insidious propaganda. Back of this propaganda, on their own admission, is a Wall Street group led by Otto H. Kahn, Jules Semon Bache, and Meyer Rothschild.

Summed up in a sentence, the scheme is one to shift the burden of from $800,000,000 to a billion dollars of taxes now paid by those best able to pay it to the shoulders of those least able to pay it.

What is worse, the form of the tax is such that by the time it came to the ultimate consumer it would be very likely to have been "loaded" as well as "pyramided" to such an extent that it would be increased anywhere from 25 to 50 per cent at each turnover. That is, in order to get one billion dollars into the national treasury, the already overburdened consumer would be bled to the extent of four or five billion dollars yearly, or approximately $40 for every man, woman and child in the United States—$200 for the average family of five.

In the hearings before the House Committee on Industrial Taxation, the iniquity of this proposed measure was made plain by the testimony of scores of competent tax experts and adversely reported on by Mr. Houston, then Secretary of the Treasury. After thoroughly and impartially pursued investigations, it was rejected as unjust and impractical by the National Industrial Conference Board, representing the greatest industrial organization in the country, through a committee of qualified experts. It was also unqualifiedly and unanimously condemned by the United States Chamber of Commerce through its committee of nine authorities of national reputation. In fact, the Kahn-Bache group of "financiers" are its only sponsors.

Congressman James A. Frear, of Wisconsin, is ably and fearlessly fighting the attempt of these bankers and brokers to relieve profiteers, who are able to put their millions into tax-exempt bonds, from their just share of the tax burden and to place it upon the country's productive workers. In a speech which should have the widest possible circulation, he mercilessly analyzes the measure and exposes the true inwardness of the motives of its chief backers. He should have the hearty support in this fight of every man who does not wish to see imposed in this country an utterly undemocratic sales tax on the necessaries of life, which, in the words of one of the greatest international authorities on taxation, "would evoke a political struggle the like of which we have never seen in this country, representing as it would an attempt to put an undue burden upon the consumer, instead of on the possessor of wealth."

There is a better way—a way which we must come to eventually, much as the tax dodgers and shifters may dislike it.

The Message

BEYOND the confirmation of a general expectation that the policy of the new administration would include the scrapping of the League of Nations and an immediate ending of the anomalous continuance of a technical state of war between the United States and the Central Powers by the obvious method of the Knox resolution, President Harding's first message to Congress confines itself largely to accepted generalities.

The message starts out promisingly with an accurate and impressive reminder that there is "no more pressing problem at home than to restrict our national expenditures within the limits of our national income, and at the same time measurably lift the burdens of war taxation from the shoulders of the American people. Announcing that "the staggering load of war debt must be cared for," and that "we shall hasten the solution and aid effectively in lifting the tax burdens if we *strike resolutely at expenditure*," the President goes on to declare that the burden imposed by current expenditures of raising five billion dollars a year is "unbearable." There are two agencies, he tells Congress, to be employed in correction of this evil: *"rigid resistance in appropriation* and the utmost economy in administration."

This, surely, reads as if it were meant to lead up to a definite pointing out of the duty of Congress in the matter of reducing the military and naval expenditures that consume some 90 per cent of the five billion dollar Federal revenue which the people are so sadly burdened to provide. But the President does not indicate the fact that there is one way in which such a lightening of "unbearable" burdens is possible; that is, by radical revision or suspension of the naval building program. As has been frequently pointed out, disarmament means, at the start, simply reduction or restriction of *additions* to the present naval forces. And the naval powers of the world are waiting for the United States to take the initiative in calling a conference for the arrangement of such reduction or restriction.

After directing the early attention to the Army and Navy appropriations as "unfinished business inherited from the preceding Congress," and declaring the government to be "in accord with the wish to eliminate the burdens of heavy armament," the President says:

> "We are ready to co-operate with other nations to approximate disarmament, but merest prudence forbids that we disarm alone. The naval program, which had its beginning in what seemed the highest assurances of peace, can carry no threat after the latest proof of our national unselfishness."

This expression is friendly to progress, but is only passively assistant. It may be a tentative intimation of further overtures to be made by us, or it may be a notice to the nations that if they wish to restrict disarmament it is up to them to take the initiative and tell us so. The President's tone is inviting but not leading, and it has this superior moral advantage that when he announces the integrity of American intentions, the world must incline to believe it. That we cannot disarm alone is true; it is just as true that no other nation can; but will we all disarm together? If so, how are we to find it out unless some one in authority puts the direct question?

The Peace of Riga

"THEY made a wilderness and called it peace" was the classic comment on an official proclamation about a century ago that "Peace reigns at Warsaw," following the last partition of Poland. Is history likely to repeat itself in connection with the peace treaty signed at Riga between Poland and the Russian Soviet Republic? At the very moment of the signing of the treaty, according to press reports, from eighteen to twenty Bolshevist divisions with artillery and an aviation corps were advancing against Poland in the districts of Smolensk, Vitebsk, Orsha, Mohilev and to the north of these points.

It will be remembered that, as one of the conditions of entering into a trade agreement with the Soviets, Britain originally demanded guaranties of a cessation of hostilities with Poland. This the Bolshevists rejected, insisting on their readiness to make a fair and square peace with Poland directly and countering with an expression of a readiness to participate in an international conference of the Great Powers and the nations of Eastern Europe! In the negotiations at Reval, resulting in the treaty now signed at Riga, a serious hitch was caused by the Bolshevist attempt to dictate to Poland the administration in detail of her own internal affairs, such as racial status and privileges and the pensioning of her own soldiers. Although, under the treaty, the Bolshevists agree to respect Polish independence and the integrity of her frontiers as fixed in the Treaty of Versailles, binding the Poles to respect the boundaries claimed for Bolshevist Russia, numerous loopholes were left for the continuance of Bolshevist machinations in the neighboring states of Lithuania, Lettonia and Ukrainia. Such machinations may make it easy to frame pretexts for charges that, in this, that or the other particular, Poland has violated the treaty and rendered it null and void.

The whole situation has been vastly complicated by the Wilsonian policy of refusing to recognize the various small nations created by secession from the Greater Russia, insisting that, with the exception of the elision of Poland and Finland, Russia's old frontiers shall remain intact, yet insisting also on the rights to self-determination of the small peoples that had formed part of the Russian Empire.

Mr. Lansing's Explanations

OSTENSIBLY written to explain the reasons for the breach between President Wilson and himself that resulted in his resignation, Mr. Lansing's book also explains many other things of transcendent public interest. It therefore has historic value beyond its exposition and defense of the personal opinions of the former Secretary of State as opposed to those of his chief. This opposition of views, by the way, enters wholly on the peace negotiations. It may even be said to condense itself into a difference concerning Article X of the League Covenant. Mexico is not even mentioned.

In the light of what has occurred since the signing of the Treaty of Versailles, it is easy to see that in a literal sense, Mr. Lansing was entirely right in opposing the article guaranteeing the political independence and territorial integrity of member-nations in the League: a guaranty inevitably implying resort to force. Even ardent admirers of Mr. Wilson and advocates of the League in the last electoral campaign must have become persuaded by the logic of such recent events as the Allied occupation of the Rhineland and the British, French and Japanese imperialism revealed in the mandates, that this incorporation of a virtual transfer of the authority of the American Congress to declare war, or to control the use of American military and naval forces, constituted the fatal flaw in the League plan. However illustriously right Mr. Wilson may have been in the passionate idealism of his battle for the League, he was here practically wrong.

On the personal side, Mr. Lansing makes it plain throughout his book that there was from the first so pronounced a temperamental incompatibility between himself and Mr. Wilson that one wonders why his resignation was so long deferred. Of a severely legalistic and official turn of mind, the Secretary of State knew the impossibility of writing international contracts in misty language that might have its value for oratory but lacked strength to serve as the foundation of international understandings.

There is some reminder of the French proverb to the effect that "he who excuses accuses himself" in Mr. Lansing's assumption of a suspicion in the President's mind that the former helped in the Senate's defeat of ratification. As to the Shantung clause, the ex-Secretary of State gives us no light on President Wilson's repeated assertions that Japan had solemnly promised to return Shantung to China.

Probably the most important revelations in Mr. Lansing's book are those picturing the very remarkable part played in the peace negotiations by Colonel Edward M. House, who, it is more than suggested, really influenced Mr. Wilson against his own better judgment and who is indicated to have been the real author of the fourteenth of the famous Fourteen Points and of Article X of the League Covenant, which follows its language.

Makers of Music

IT HAS been asserted that the first mention of music is at the creation of the world when, according to the Bible, the morning stars sang together for joy. From that day down to the present, those who have made music have been honored and beloved.

When a few weeks ago, Caruso lay upon his bed facing death, people all over the world watched for the bulletins which were issued by his physicians, and prayed that the singer might recover and once again make music for the multitude.

And while we laud those who have given to the world their masterpieces of music, let us not forget those who, in another manner, have put music and song into the lives and hearts of others, whose names are unknown and for whom no monument ever will be raised.

There is the woman who is obliged to care for her parents through years of sickness and adversity, but through all the years is filled with song and at the same time strikes chords of happiness in the hearts of those near her.

There is the invalid, suffering and chained to her chair, who maintains a sweetness of character and serenity of spirit which fills each day with brightness and song.

And there is the man from whom fate has snatched all that is dear and seemingly worth living for, who still "carries on" with a smile, and gives to others the music which he himself has been denied.

These are the real musicians who make the walks of life easier because of their music. They are the persons who, when the winds of adversity blow, amid the tumult keep a clear head and a brave heart.

Mr. Ford's Page

MANY a man thinks he has lost faith when he has only lost his illusions. It is one of the penalties we pay for not making proper distinctions between values. The power of illusion is so great, that when the illusion vanishes we think that the bottom has fallen out of reality; the truth is that only the mists have been dispelled. The mists sometimes give illusions of flowery meadows beyond; when they lift we see a hard road.

Illusions can be lost, but faith cannot. A good deal of credulity can be turned into skepticism, but faith cannot. A man may lose many things, but he cannot lose anything that he once possessed as part of his very self; and faith is such a part.

It is perhaps impossible correctly to see illusions until they have vanished, because they fill so large a part of the foreground of our minds while we have them. They are like the dreams of youth which are very real while they last, and even after they pass leave fragrant vestiges behind, but which in the clearer light of reality we see to have been wrongly placed. They were beautiful, but they were not true; at least they were not *yet* true. They may have been foregleams, as when a sunny day foretells the Spring, but is succeeded by weeks of raw and changeable weather.

Illusions are numerous and take their color from the man himself. Perhaps the most common of them all relate to ourselves and society. There is a comfortable feeling which most of us possess at some time in our lives and which is based on the supposition that all men are good and unselfish. This feeling seems to be confirmed during youth, for as a rule the world does not show its hard side to young people. A great defect in ordinary education is the teaching that everyone is all right, when later experience, if it be normal, cannot but show that everyone is not all right. There is a sort of education which tends to make us soft and overdeveloped on the conciliatory side, so pathetically anxious for harmony that we are afraid to stand up for the truth which comes like a divisive sword and cuts men into parties.

Society is suffering a reaction from that attitude now, because of the weakness in ordinary thinking which leads the ordinary mortal, for a time at least, to say to himself, "Everybody is for himself alone; I will therefore be for myself alone, and the devil take the rest."

There are people who in their reaction turn to a deeper dye of the thing which they thought was not there and have found to be there; their reaction is not toward the actual condition as a real condition but incomplete, and then goes still further toward the condition that ought to exist. That is, men disappointed in their illusions as to human society often turn defensive and predatory, instead of constructive.

That is the cause of what is called "class consciousness" today—a predatory attitude toward a class to which one conceives he does not belong. It is seen at its most fateful development in Russia, and its existence is a warning to all men.

There is enough good in society to preserve it for all social purposes, but it is not of the ice cream party or missionary kind. It doesn't go out in large and generous waves, but it is there, waiting to greet its own kind when it comes along. But some men's bitterness upon the loss of their illusions is so strong that they miss the very thing for which their natures are searching. In the great social upheaval in Russia, there is a terrible lack of idealism. As one who has been through it says, the idealists become rapacious hypocrites as soon as they come into power. No political or social philosophy can be blamed for this; it is simply human nature.

Illusions are fine things to keep up afloat until we find our feet, and the best thing that can be said of them is that they trend mostly in the right direction. If they were not mainly tinged with the right color, they would not last long as illusions. Uncomfortable illusions depart sooner than any other, for truth drives them out; if truth is kindlier to our comfortable illusions, it may be because these are more akin to truth itself. However, illusion is at best a mirage, while faith has something solid about it—it is perhaps the solidest thing in the world. All faith at last is one faith, though the expressions of it may vary.

People do not commonly think of faith as solid and substantial; they regard it as an airy fairy nothing, colored balloons which one sends up for one's own amusement. This is because they have confused faith with something else.

Faith is know-so more than hope-so. Faith may begin as a conscious preference; it ends as an ironclad proof. The man who has faith *knows*. There may be still much work to be done on the drawing board or in the experimental room to make his faith articulate, but nevertheless he knows just as assuredly as if the thing were the commonplace of everyday agreement.

Faith is a higher grade of intelligence and is accessible even to those whose brains do not move easily in routine methods, who do not manufacture their thoughts according to the rules made and established by the professionals.

The rule ought to be, the less illusion the more faith, because illusion may be balmy, but faith is dynamic. Illusions are sedative, faith is stimulative. A man rests on his illusions, he climbs on his faith. Illusions grow less and less as life goes on; faith grows more and more. Illusions are many, faith is one.

Faith is the material out of which all the things that are yet to be are made. It is an invisible and plastic substance capable of taking upon itself the reality of visible form. Not only is it substance, but it is force as well. It probably does not create anything that already does not exist, but it has power to bring the invisible things into the visible plane where all men may use them. Faith is the matter out of which new pattern things are made, and after they appear, then commonplace men may make the same things out of wood or laws or systems, or whatever it may be.

We talk about having faith in ourselves. Well, if we know what that means, it is true; but too often it means only a stimulated self-confidence, the assumption and presumption of a "front." But plainly and simply, faith must be in ourselves, because there we make the only contact with reality that we can make. It is faith in ourselves as having become at last a useful part of the whole, that the term really signifies.

We sometimes talk about faith and sight as if they were opposed; they are the same thing. The only man who walks by sight is the man who walks by faith, for he is the only man who can see. Nobody sees anything until faith has brought it within the sphere of vision.

Faith is the sixth sense that completes all the others and it shows itself chiefly in loyalty to Duty, for Duty sums up all the creative work we do. Our career is our duty, and our duty is our contribution to life. Creative work is not a fine and pleasant frenzy; it is often doing what we would not choose to do, for we are chosen oftener than we choose. A man plodding along at what he knows to be his duty is an agent of the universe, in his right place. Not only is he doing something, but something is being done for him. Faith works changes both in the agent and the objective. It is the creative medium, without any limit that has been found.

A MAN is always losing his illusions, but not his faith. It is the nature of faith to grow and increase, for faith is a higher knowledge—an advance copy of what soon will be current knowledge. Illusions are lost because they are outside the man, but faith is inside, a personal, undetachable possession. Faith is a sixth sense which apprehends invisible things that are yet to be brought on to the visible plane. Faith is progressive because it is positive; unfaith is negative and therefore unproductive. Faith is its own guaranty, for while a man may have wrong illusions, his faith cannot take root except in the soil of truth. A man may have many illusions; he can have only one faith.

MARIA FLORES de ZAPATA,

The little Indian girl of Southern Mexico, who was left a widow by the killing of the Master Bandit.

A Master Bandit Passes

IN THE autumn of 1910, the federal government of Mexico, celebrating the centennial of the nation's independence, released from military prison, and from penal service in the army, several scores of prisoners. Among them was a tall, thin, sharp-faced, eagle-eyed Guerrero Indian, named Emiliano Zapata, consigned to the army nearly ten years before for highway robbery.

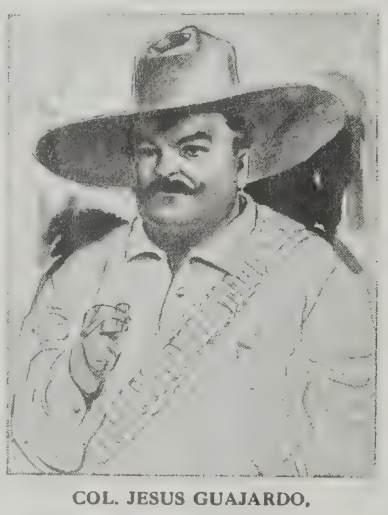
In the autumn of 1920, ten years later, death came to this descendant of the Aztecs, in a machete battle with an officer of the federal army, Colonel Jesus Guajardo, near the village of Calixto. Two days later, the head of Emiliano Zapata, perched on a pikestaff, looked out over Mexico City from the arched doorway of the main barracks.

During the decade between 1910 and 1920, Emiliano Zapata, starting in revolution against the elder Diaz, won control over approximately one-sixth of the 800,000 square miles of Mexican territory; dominated three large states, ruled more than 2,000,000 of the 16,000,000 inhabitants of the country; named two presidents and had a hand in naming the third; came twice into control of Mexico City, which he once looted; destroyed 27 towns and villages; distributed more than 10,000 square miles of arable land among the poor of the states he ruled, after seizing it from its rightful owners; and, finally, came to his end in as spectacular a battle as ever was fought in the days of Knight-errantry, with weapons not unlike the broadswords of the time of the Crusaders.

Here is the story of the Master Bandit, sometimes called "The Attila of the South," told in part by an American who campaigned for several months with Zapata, at the height of the latter's power, and in part by the widow of the Guerrero Indian, who, by chance, was a witness to his death.

EMILIANO ZAPATA,

Highwayman, bandit, revolutionist, president-maker and modern Robin Hood, of Mexico, whose death in a machete duel removed the most picturesque character Latin-America has produced since the Age of Piracy on the Spanish Main.



By HARRY H. DUNN

EMILIANO ZAPATA is dead, dying, as he lived, by the sword. To thousands to whom the names of Ghengis Khan, Attila, Captain Kidd and Geronimo are familiar, this message from the jungled slopes of Southern Mexico will mean little. Yet with the going of Zapata passes a bandit, disguised some of the time as revolutionist, whose victims numbered thousands, whose loot was millions, to whose torch more than a score of towns and villages smoked in ruins, who made at least two presidents of Mexico and unmade half a dozen, and whose word was law in nearly one-sixth of all the national territory of the mainland of Mexico. At one time, not so long ago, an army of 20,000 well-armed and mounted men rode at his back, and for ten years, one decade out of the book of history, he was the most dangerous factor in all of restless Mexico, albeit Francisco Villa, Venustiano Carranza and half a score of lesser looters received more space in the newspapers.

There is no myth about Zapata. I rode with him to the loot of Cuautla, to the sacking of Jojutla, to the capture of Huitzilac, to the occupation of Cuernavaca, and I saw the smoke of his campfires in the jungle to the south of Vera Cruz, when, during the days of the American occupation of that port, he moved his army 200 miles to strike a blow for Mexico at the invader from the North. The first picture I have of Zapata is that of a tall, thin, dark-skinned, black-eyed, black-haired Indian, with the eyes of a snake, leaning over a huge boulder, watching me make my way, in the midst of six members of his Death Legion, up the slope of El Jilguero—the Hill of the Linnet—to meet him. The last time I ever saw him, a stooping *peon*, the brass tag of a *cargador* on a chain round his neck, hailed me as I passed through the Calle Flamencos (the street of the Flamingos) in Mexico City, and pointed to a bulletin, posted on the corner of the high wall of the Thieves' Market. The bulletin read, "Fifty Thousand Pesos Reward for One Emiliano Zapata, Rebel and Bandit." The peon was Zapata, and before he left the beautiful capital to rejoin his troops a hundred miles to the south, he, with his own hands, posted a bulletin on one of the Ahuehuete trees in the park of Chapultepec, the presidential residence, threatening to hang the then president—Madero—to one of these same trees.

Such was Zapata, a grim practical joker, in the midst of his murders; a man who allowed his followers to carry off every pretty girl they desired, yet who himself sent fifty of his best men to deliver one little American woman missionary over 200 miles of mountain trail to the headquarters of her church in Mexico City; a man who bound priests to huge cacti, sprayed them with oil and burned them alive, yet gave every cent of his loot of hundreds of thousands of dollars from the Catholic church to people of the villages; a man who drove more than 5,000 landowners from their properties and divided nearly 10,000 square miles of arable lands among the poor Indians of three states; a man who killed Spaniards as one would rattlesnakes, yet who never harmed one American, one Briton, one German, one Frenchman, or any other foreigner.

In 1899, Zapata was a highwayman, operating on the trails of the states of Morelos and Guerrer. In 1900, the Rurales of the Diaz Government caught him, and he was sent into the federal army for fifteen years. By good behavior, and the making of friends where friends would do him the most good, he was released at the end of ten years. Meanwhile his father had died on the family hacienda at Villa Ayala, not so far from Cuernavaca, the beautiful capital of the state of Morelos, about 75 miles south and west of Mexico City. To Emiliano Zapata and his less crafty, though not less cruel, brother, Eufemio, was left the estate. To it they returned, built upon it a stone fort, and, in the restless days of late 1910 and early 1911, turned highwaymen again. As the Madero revolution gained in the north of Mexico, this pair gradually resolved themselves into "revolutionists," captured and sacked two or three villages, and soon had a following of nearly 1,000 men.

COL. JESUS GUAJARDO,

Who killed Emiliano Zapata in single combat with machetes. Guajardo afterward revolted against the government, and, early in 1921 was killed from ambush by federal troops.

The federal army was occupied in the north; there were plenty of men, mainly German importers on both coasts of southern Mexico, who sought the dollar wherever the dollar rolled, without consideration of the manner in which they caught it. These men supplied the Zapatas with rifles, machine guns, automatic pistols and ammunition, until the stone fort at Villa Ayala resembled an arsenal. The unfortunate Madero, either misled by Zapata, or not caring by what means he overthrew the government of his country, gave recognition to the bandit leader, and the latter started on a career of slaughter and loot without a parallel in the history of the New World. Within six months he had gathered and organized an army of 12,000 men, which within the year became 20,000, as nearly as I could estimate it by watching it ride past in review. Before the first of June, 1911, on the seventh of which month Madero, at the head of a triumphant revolution, entered Mexico City, Zapata was in complete control of the large states of Morelos and Guerrero, as well as of parts of the states of Vera Cruz, Puebla and Hidalgo, and had his spies scattered in every walk of life in Mexico City. To himself he attached a former schoolmaster, named Ismael Palafox, to whose clever trickery Zapata owed in large part the nearly ten years of his mastery of Southern Mexico.

When Madero became president, Zapata turned against him, claiming that the Coahuila Dreamer had broken certain pledges made to him in the height of the revolution. Since Madero made such preposterous pledges that it was impossible for him to keep them, this is probably one of the rare instances in which Zapata told the exact truth. By striking rapidly from his mountain headquarters at Villa Ayala, Zapata, within fourteen months, laid in ruins and, for the most part, burned, 27 villages and towns, dynamiting the public buildings and destroying all records of land titles, marriages, births, deaths, wills and similar documents necessary to the security of life. In the same period he drove 5,220 landowners from their properties, and amassed a pile of gold and silver coins at Villa Ayala, which, his widow told me in New Orleans a few days ago, totaled more than 2,000,000 pesos, or approximately $1,000,000.

Then, with all these vacant farms and all this money on his hands, Palafox conceived the idea of creating a national hero for Mexico. Over night, Zapata issued decrees distributing lands and money to all the poor of Morelos and Guerrero, with further distribution of other lands and moneys promised to the poor of other states, provided they would give aid to the army of Zapata, who commenced signing his proclamations, "El Atila del Sur"—"The Attila of the South." Being a pronounced infidel, Zapata scarcely could call himself "the Scourge of God," but he scourged and ruined an area larger than ever the Hun looked on when he crossed the Apennines and beheld the Roman world beneath him. Federal armies sent after him, if too large, were eluded until their generals broke them into small divisions, the better to operate in the mountains of the southern states. Then each division was lured into ambush and destroyed. It was difficult, if not impossible, for the Madero government to find 20,000 men in all Mexico who would remain loyal in the face of the lures Zapata offered them, and hundreds deserted to him from the federal forces, some of them officers quite high in command, who gave him the benefit of their military knowledge.

Victoriano Huerta, commander of the federal armies for the Madero government, then gave personal attention to Zapata—and, being as wily an Indian of the North as Zapata was of the South, tricked the bandit into battle at the Hill of the Horseshoe, inflicted the first, last and only defeat the Zapatistas ever met until the death of their leader a few months ago. About this time came the uprising of Felix Diaz, Manuel Mondragon, Bernardo Reyes and the army against Madero. Zapata lay quiet in Tlalnepantla, a suburb some ten miles out of Mexico City, with about 8,000 men while the Decena Tragica reigned in Mexico City. It is history that Huerta's defection to the side of the military revolution doomed the Madero government. Then the United States intervened at Vera Cruz to get a salute to the flag, and Zapata suddenly showed an odd phase of his many-sided character.

Gathering all his forces save a small guard left in the larger towns of Morelos and Guerrero, he moved to the gulf coast of the state of Vera

How Senator-Scientist Views Farm Problem

SCIENTISTS have had little if anything to do with law-making. You could probably count on the fingers of a single hand all the real men of science who have served in the United States Congress.

There is one of international repute in the Senate today. He is Dr. E. F. Ladd, from North Dakota. Elected by the Non-Partisan League and a so-called radical, conservatives say privately they are glad that he is now one of them.

The doctor will probably be, more nearly than any other man has ever been in Congress, the accepted spokesman there for the agricultural interests of the country.

In this interview the Senator-Scientist tells of some of the agricultural problems as he sees them, and points how they are of more importance to people in the cities than to those on the farms.

DR. E. F. LADD,
Non-Partisan League Senator from North Dakota

"UNLESS there comes a change in the nation's views on farming, we may look for a crisis that will be the worst and the costliest the country has ever known. France faced such a crisis fifty years ago; so did England; and in each of those cases the trouble was due to causes like those which are now coming to a focus in this country. The chief cause was and is concentration on the growth of what we call business and industry, to the exclusion of agriculture. When I say 'business and industry' certain things come to your mind as symbols of what the words mean. These symbols are factories, stores, warehouses, perhaps ships and railroads and mines. The words don't suggest farming, for they haven't and don't yet mean farming. That's the chief error in our national view of farming. It can be corrected only by bringing farming into the group of activities you think of in terms of 'business and industry.' For farming is now as much of a business or industry as any of the others and it will survive only in case it is so viewed and treated by the nation."

The speaker was Dr. E. F. Ladd, new United States Senator from North Dakota. Dr. Ladd is not by occupation a farmer. But his election was due distinctly to the demand of the farmers of his state that they have in the United States Senate a spokesman who could talk with absolute authority. Not the authority merely of an official commission, nor even that of the plow-handles or the pitchfork, but of scientific knowledge of the problems of agriculture. It probably has been a long time since Dr. Ladd rode a harvester, grasped the handle of a hoe, or even looked after plowing up a field. Yet for twenty-five years or more he has been accepted as an authority, beyond probably any working farmer, on agriculture. What he knows has been gained by lifelong laboratory studies out of reach of the man who must make his living in the fields. For many years he was head of the North Dakota Agricultural College, and in addition to looking after the training given youths, he carried on fight after fight for the farmers and the public generally of his section.

"In the last quarter of a century," he said to the writer, "I haven't gone to bed a single night without being a defendant in one or more court fights arising from my work. Among others, I have on my hands just now a libel suit for one hundred thousand dollars. In no case, so far, has the final court decision been against me." The doctor has had tugs of war with most of the big trusts, for he was one of the earliest advocates of laws putting crimps into monopolies, and protecting the public against such things as impure foods. He was one of President Roosevelt's advisers in the pure food fight of fifteen years ago. Being a chemist as well as an economist of wide fame, he has sometimes even been summoned abroad to give expert advice on food problems, as in the fight over bleached flour in England.

His Coming Pleases Senate

ODDLY, Dr. Ladd is one of only a very few men of science ever elected to Congress and probably the only one of his type ever to sit in the United States Senate. Though his election was due to the Non-Partisan League, the run of even the most conservative Senators viewed with pleasure his coming to Congress. For whatever you may say about it in other respects, Congress always has a warm welcome for the man who knows what he is talking about, even though the bulk of other members don't agree with all he has to say. And those who know look upon Dr. Ladd as such a man. Hence, to an extent greater than has been the case with any Senator of the past, Dr. Ladd is likely to be accepted as the senatorial spokesman and authority for the farmers of the country. During most of an afternoon of one of the first days he spent as a Senator at the capital, Dr. Ladd talked over with the writer the problems of agriculture as he sees them. There was one striking thing about the way he dealt with the subject. Rarely was he local and then for purposes of illustration only. Behind what he said there was clearly a national, even an international, conception of the subject.

"Just as farming is no longer a mere calling to which a person is born, it can no longer be viewed as a local or state, or, in many senses, a national subject alone," he said. "What the farmer of Australia is doing is of big importance to the farmer of North Dakota. Likewise the cotton farmer in the South has vital interest in what the Egyptian fellah on the Nile or the Hindoo on the Ganges is doing. For a big or a short crop of wheat in Australia or the Argentine or, in normal times, in Russia, may mean whether my neighbor in North Dakota will be able to pay his debts when the fall harvest is put in the market. What goes on among the non-farmers of England, or Germany, or China, is of importance to the American farmer, too. For his interests are affected by world consumption just as well as by world production.

"One of the first things we should do for our farmer is to see that he is supplied with the world information he needs for planning his work. At present he gets none, which condition is made worse by the fact that those who buy his products do get it in very large part. There is one distributing concern in the United States that gets world data on grain crops and on meats, and you may be sure it doesn't share the information with others. It has every advantage in buying from the farmer, who must plant and harvest and sell altogether in the dark as to the forces that shape the prices of his products.

"What the farmer must be enabled to get is not high prices in the strict sense, but the prices that are due him. He should have the benefits as well as bear the penalties going with the law of supply and demand, which is not the case at present when he has to bear more than his share of the penalties and is not allowed a full measure of benefits.

How Conditions Have Changed

"THIS state of affairs is due, as I said, to our national view of farming. After the Civil War the country turned very wisely to developing what we know as the country's industries, mining, manufacturing, transportation. At and prior to that time we were a nation of farmers. We had an endless amount of cheap land because there were immense areas of free land. Farming was a simple process and life in the farming districts was equally simple. Local equations in great measure controlled. We assumed, if we thought of it at all, that farming conditions would always be as they were, and we put all of our national thought upon the development of other phases of the national life.

"Meantime, farming conditions changed. The free lands were taken up and settled and the old areas became so populated that the farmer could not, as had been the case before, get at small price new and virgin soil whenever that he had been tilling was exhausted.

"The means of distribution also became much more complex. Instead of a local market, the farmer had to deal with a national and even an international market. And all of this had come about not with the view of helping the farmer—as I said, he didn't seem to need help—but for aiding in the growth of other parts of the national make-up, like the cities which did seem to need help.

"It was assumed that the farmer's end would take care of itself. Hence on the road from farmer to consumer there grew up a vast mechanism in shaping which the farmer had nothing to do and over which he had no control. This mechanism in time came to exist largely for its own sake rather than as an instrument for either producer or consumer. And it has reached the point where it devours a fearfully large part of production. Its toll isn't limited to the support of the terribly large number of persons needed in manning the mechanism of distribution, but in great part is a tariff taken by speculation. That tariff is comparable to the extortions exacted by the robber barons of old, because for the tax of speculation on production no service whatever is rendered, not even the protection which the robber barons gave their victims.

"I know of many farmers who, during the last year, have sent products into the markets and instead of getting a money return, no matter how small, have received bills for sums covering the excess cost of distribution over the price allowed for the article.

"The wheat farmers of the country received for the wheat exported in 1920 about $210,000,000 less than they got for wheat exported in 1919, the volume being about the same for each year. Yet those who consumed the wheat exported last year paid about $90,000,000 more for it than for what we sold them in 1919. A toll of about $240,000,000—I allow for increased railroad rates—was taken on the road from producer to consumer above what was taken the year before.

"That the American farmer can survive a system of distribution which permits of what I had said, is an impossibility. But it alone isn't the farmers' chief handicap in the race of life. Without the toll of speculation, distribution costs more than producers can bear even when consumer shares, in the form of high prices for foodstuffs, a due proportion of the burden.

"During the past winter, Danish dairymen laid down butter in New York at prices below the cost of production, with that of distribution added, to the American dairymen. And you will be more astonished when I tell you that much of that Danish butter came from cows fed with feed grown in my state, 2,000 miles from seaboard, and shipped across the Atlantic.

"The reason why Danish dairymen could export butter made from North Dakota feed into our markets cheaper than mid-western dairymen could do, is because Denmark, like France and England, many years ago reached the crisis now facing us in America, and solved it. Today when a tub of butter reaches Liverpool, a Dane, perhaps the direct representative of the farmer that produced the butter, is at the dock awaiting it. The tortuous route between producer and consumer, even when separated by the seas, has been shortened and simplified for the Danish farmer, with the result that he can buy our feed and ship us butter very often for less than our dairymen can get it to our consumers.

$1.50 Worth of Wool in Suit

"A SHEEP-GROWER friend of mine recently, while packing his marketless crop of wool into a warehouse, noticed a tailor's sign across the street from where he was working. He went over and asked what a good suit of clothes would cost him. He found that it was all a strong man could do to lug to the tailor shop at two turns the amount of virgin wool he would have to sell to get money enough to buy one suit of clothes. And for the wool actually used in the suit he would have received less than $1.50. All the rest of the wool that he would have exchanged for the suit of clothes would have gone to the vast number of persons on the road from farm to consumer, and only a few small portions of it to the workers in the factory and to the tailor who transformed it into clothing. There were probably a thousand miles and scores of handlings on even the road from warehouse to the tailor shop across the street.

"Why should a steer or a hog grown in Minnesota or North Dakota have to travel alive to Chicago and be shipped back in parts to the vicinity of production before it is available in Minnesota or North Dakota for food? Why should a pound or two of cotton pass through dozens of hands on the way from Oklahoma to Maine and then back again, before the farmer who produced it can get it back in the form of a palm beach suit? And why should a dozen or more men who contribute nothing to the growing of the cotton, the making of the cloth or the manufacture of the suit—who never see or touch either of them—take tolls from cotton, cloth and suit, and often in the form of speculative profits only?

"The answer to all those questions and numerous others are hard to find, but they must be found if farming is kept from falling into the hands only of old men who are passing from the stage and children who

Jew Trades Link With World Revolutionaries

Only 600,000 Communists in Russia; More Than 300,000 in Two Jewish Trade Unions Alone. The Kehillah a "Clearing House"

THERE are more Bolsheviks in the United States than there are in Soviet Russia. Their aim is the same and their racial character is the same. If they are not able to do here what they have done there, it is because of the greater dissemination of information, the higher degree of intelligence and the wider diffusion of the agencies of governmental authority, than obtains in unhappy Russia.

The power house of Bolshevik influence and propaganda in the United States is in the Jewish trade unions which, almost without exception, adhere to a Bolshevik program for their respective industries and for the country as a whole.

This fact is proving most embarrassing to the Jewish leaders at the present moment. It is bad enough that Russian Bolshevism should be so predominantly Jewish, but to confront the same situation in the United States, is a double burden of which Jewish leaders do not know how to dispose.

Yet it is difficult to see how the International Jew can be absolved either from the necessity of being confronted with it, or from the necessity of bearing sole responsibility for it. Russian Bolshevism came out of the East Side of New York where it was fostered by the encouragement—the religious, moral and financial encouragement—of Jewish leaders. Leon Trotsky (Braunstein) was an East Sider. Whether he was a member of the New York Kehillah is not known. But the forces which fostered what he stood for centered in the Kehillah, and both the Kehillah and its associated American Jewish Committee were interested in the work he set out to do, namely, the overthrow of an established government, one of the allies of the United States in the recent war. Russian Bolshevism was helped to its objective by Jewish gold from the United States. And now that it is found to be numerically much stronger in the United States than it is in Russia, the fact causes no little embarrassment.

Denial is useless, for the thing is too blatant and has advertised itself too long. What amazes the student of the Jewish Question in the United States is the stupidity which permitted Jewish Bolshevism to flaunt itself so openly during the past few years. The only explanation that seems at all adequate is that the Jews never dreamed that the American people would become sufficiently awake to challenge them. The present widespread exposure of Jewish tactics in the United States has doubtless come as a surprise to the Jewish leaders, and this cannot be accounted for otherwise than that they thought they had gained too strong a grip on the American mind to make a challenge possible.

Judges Try to Cover Bolshevism

IT REMAINS to be seen whether the Jewish leaders shall be able to control the Frankenstein that their false policies have created.

Following exactly the program which the Jewish leaders approved for Russia, the organized Jews of New York are exhibiting a zeal and a directness which Jewish leaders would like to curb for the present, if we are to judge from some of the complaints that the Bolshevik Jews are making.

Benjamin Schlessinger, president of the International Garment Workers' Union, whose membership numbers 150,000, and which is a part of the New York Kehillah, is one of the complainants. His union, of course, is not the regular American labor union formed for the betterment of working conditions and wages; it is a revolutionary union for the complete change of the social system, involving also a change of government. In an interview printed in the *Jewish Forward* of April 8, Schlessinger complains against the manner in which Jewish judges have recently come to interfere with Jewish strikes:

"'And Jewish judges come to their assistance. They issue injunctions; and it is said that they do it to save the Jewish name, so that it shall not be said that "all Jews are Bolshevists." So the injunctions become a Jewish affair . . . .

"'We have a gigantic wide-branched Kehillah in New York. In all corners, Jews! All over, what you see and what you hear—Jews. And, of course, also dress; politicians and greater ones.'

"But only *we* may say this. And I understand Schlessinger . . . . Schlessinger explains it this way: Several reasons are given why judges like (here a Jewish judge is named) twist the law . . . . The real purpose is to break our strike . . . . But, then, after all, there is a reason, a Jewish reason. He wants to demonstrate to the American community, he claims, that not all Jews are Bolshevists."

This excerpt shows several things: that only "we" may say certain things; that Jewish authority is trying to cover the blemish of Bolshevism; and that this is done in order to demonstrate to "the American community" a certain desirable thing. The Jewish community, it is presumed, is not so easily impressed. The Kehillah is apparently trying to call in its kites but they have apparently flown too high in the rarefied atmosphere of revolutionism.

Another big union which makes part of the New York Kehillah is the Amalgamated Clothing Workers of America, whose membership is about 200,000. It is officered by Russian Jews whose pronounced Bolshevik utterances have been widely reported in the Jewish press of New York, until plain and unprivileged Americans have wondered how far treason to the United States Government could go on our own soil.

Their Master Trotsky's Voice

SIDNEY HILLMAN, the president, is one of the most radical Socialists in the United States—so radical that he would probably spurn the name of Socialist as ordinarily used. He is a Sovietist. He is so far "advanced" that to him the regular type of American labor union is "a scab union." The purpose of the American labor union is stated to be the improvement of the workers' condition in industry and the establishment of their industrial rights, whereas the object of Hillman's union is the overthrow of industry and its communization in the hands of the radical element. That is to say, Russia over again. Hillman was born in Russia. He personally knows most of the Bolshevik Jews now ruining that great land.

The secretary of the Amalgamated is Joseph Schlossberg, also born in Russia. Schlossberg has a very free gift of words. One of his promises to his Jewish followers, publicly made at Madison Square Garden, is this:

"The clothing industry is ours. We are not going to permit the employer to determine where his factory shall be, or how many hours we shall work."

Abraham Shiplacoff, a Socialist member of the New York board of aldermen, and next to Sidney Hillman in command of the Amalgamated, is also a free speaker, as the following excerpt will show:

"We are going to move heaven and earth to educate our people that they and they alone are the owners of industry. The workers of Russia have found it out, God bless them!

"If I knew old Sammy Gompers knew as much as that, I would tell you to go and do what the workers did in Turine. Ten thousand of them marched to the factory with music and a flag, and they opened the doors and went to work and said, 'To hell with the owners of the factory.'

"Everybody knows it is war. We are going to control the industry."

Always the omission, of course, that the factories so spectacularly captured, cease to run soon after. The Hillmans and the Schlossbergs and the Shiplacoffs are heroic figures on the platform, but in manufacturing the common commodities of life and making both ends meet so that the consumer may be served and the producer rewarded, they have been the most tragic failures. "The workers of Russia have found it out, God help them!"

As a matter of fact, besides the I. W. W., the Amalgamated is the only organization which not only preaches Bolshevism but actually practices it—all in the United States, and all apparently in perfect consistency with its membership in the Kehillah and under the officership of the high gentlemen of the American Jewish Committee. The Amalgamated actually does run the industry which has mulcted such a heavy tax from the American public since 1914.

Not a Native American in All

THEY tell the factory manager where the factory is to be located.

They have a minimum wage of $12 a day, independent of skill or production.

They enforce that rule, that an employe who has worked for two weeks has thereafter a job for life.

No improved machinery can be introduced without the union's permission.

The employer cannot hire even a cartage firm that the union has not first approved.

The employer cannot withdraw from business unless he goes into bankruptcy, else the whole force of the union and its allies will be marshaled against him and his. He must inform the union of all his plans in advance.

This, of course, is part of the endowment of Trotsky to the East Side. He did great missionary work there while waiting to go across and take the Czar's place. Even to this day in the Jew-controlled theaters that crowd Broadway, the picture of Trotsky brings wild delirious cheering, while the portrait of the President of the United States is hissed. A favorite stage scene is the Star of David high over all flags. The recent debate between Senators King and France, said to have been organized with the assistance of two rabbis, developed into such an outrageously anti-American pro-Soviet demonstration, that prudence intervened to prevent a vote. Recently when pro-Jewish Germans endeavored to stir up trouble by holding a great mass meeting to protest the alleged "Black horror on the Rhine," the audience was packed with Jews. Not that they love Germany more, but they love any regular government less. While a few days later, at a great American meeting, the Jews of New York, according to the testimony of incredulous observers, were most conspicuous by their absence.

Now, the Jewish leaders must admit that the Jewish Question does not consist in American citizens uncovering these facts and helping other American citizens to become aware of them; the Jewish Question inheres in the facts themselves and in Jewish responsibility for the facts. If it is "anti-Semitism" to say that Bolshevism in the United States is Jewish, so be it; but to unprejudiced minds it will look very like Americanism.

There is not a single, solitary American-born citizen serving as officer or director of those great unions which form part of the New York Kehillah. These men have not the faintest idea of what America stands for. They are not here to become Americanized, but to change America to their own model. In this they have the articulated support of most of the Jewish rabbis who have been very keen to explain that *Americanization does not at all mean what the American means by it.*

America will have become what these people want it to be when America is sovietized with Jewish radicals in control, and that is the objective toward which they are working now.

The other officers of the Amalgamated are Jacob Petowsky, secretary, who is a Russian Jew, and J. B. Salutsky, who is also a Russian Jew and "National Director of the Educational Department," which means that he is the propagandist of the union in the United States.

Statistics on 2,000 Jewish Leaders

REGARDING the assertion that the great radical unions are not officered by native-born citizens (the statement has been made that Russian Jews do not usually complete their citizenship but stop short at the "declaration of intention"), there is some interesting material in a study of 2,000 presidents of Jewish organizations in New York City.

Of this number, 1,054 were born in Russia, 536 in Austro-Hungary, 90 in Rumania, 64 in Germany and four in Palestine. These countries produced 89.1 per cent of Jewish leaders in New York.

Of this number, 531 entered the country between the ages of 14 and 21, and 977 entered over the age of 21.

Of this number, 1,270 are still under 50 years of age.

These figures include all organizations from synagogues to trade unions.

How far they have been Americanized, or wish to be, can only be judged by the policies and activities of the organizations which they direct.

The big Jewish labor organizations are the direct offspring of the Jewish Socialist Bund of Russia. It is due to the propaganda of the Bund in the United States that the united Hebrew trades have gone over to the ranks of radicalism. Bundists swarmed to the United States after the abortive revolution of 1905 at which time they failed to put Bolshevism over in Russia, and these Bundists gave their time to the Bolshevizing of the Hebrew Trade Unions in this country. An Agitation Bureau was formed which propagated radical Socialism through the medium of the Yiddish language, which is one of the official languages of the New York Kehillah, made so by the demands of the Kehillah's overwhelming radical constituency.

The Bundists incorporated in 1905 in New York an organization known as "The Workmen's Circle" and "swelled the ranks of the Jewish trade unions," to quote the Kehillah's Register. After a brief attempt to propagate Socialism without reference to the Jewish Question, it was given up, and in 1913 a resolution was adopted declaring that the whole purpose of the work was Jewish. This is attributed, in the Kehillah record, to the spread of "the idea of Jewish nationalism."

Now, care would have to be exercised to avoid confusion between the Hebrew labor unions, radical as they are, and the avowed communistic bodies, if it were

not the fact that the unions and the Communists are so inextricably interlocked as to make distinctions unnecessary.

That this is not a judgment dictated by mere adverse attitude may be seen from the following facts:

The Workmen's Circle has 800 branches throughout the United States and is officered by Jews throughout. The membership is 98 per cent foreign-born and is Jewish in like proportion.

Among the higher officers of this organization are Joseph Schlessinger, Sydney Hillman, Benjamin Schlossberg, Sam Feinstein and J. B. Salutsky. The names will probably have become familiar to the reader by this time. They form part of the interlocking directorate so commonly found among Jewish organizations, a system which finally heads up in the executive committee of the Kehillah which also composes the leaders of the American Jewish Committee, of which the great public lights of Jewry are members.

Schlessinger is president of the Union of Ladies' Garment Workers, and made a trip to Russia in behalf of communism in the United States, to finance which the members of the Communist party were assessed $1.50 each.

Hillman is president of the Amalgamated Clothing Workers of America.

Schlossberg is secretary of the Amalgamated Clothing Workers of America.

Feinstein is secretary of the United Hebrew Trades.

Salutsky is food commissar to the striking Amalgamated, and is national director of Bolshevik propaganda carried on by his crowd.

They are, of course, all Jews.

Not "Parlor Bolsheviks," But Active

THE line-up is this: Hebrew trade union leaders are also members of the Workmen's Circle and of the Communist party, and the majority of their trade union followers go with them into the other associations. The reverse process is this: Communism and radical Bolshevism then find their way to the consciousness of the American public by the Bolshevik demands of the so-called trade unions of Jewry.

An extreme defense of all this activity might be that these Jewish leaders and workers are only enamored of the *idea* of Bolshevism, are playing with it academically, and are not to be considered as actively the proponents of a form of government contrary to the Constitution of the United States and to be established by "direct action."

This defense, however, appears insufficient when confronted by another set of facts in which these same union leaders and Communists are shown to be in communication with the Soviet government in the United States—and the Soviet government in the United States is not a mere *idea*, it is a *program*. Moscow has repeatedly stated that the purpose of the Lenin-Trotsky government has been World Revolution. And one reason for the colossal economic failure of the Soviet governmental experiment has been the Jewish Soviet leaders' neglect of their proper work to follow this fetish of World Revolution. If one-tenth the effort had been made to govern and feed Russia that has been made to sow Bolshevik ideas in other countries, Russia might today have been in a less unhappy plight. Propaganda is the sole art which the Bolsheviks have mastered.

This Soviet government in the United States, therefore, must be regarded as an advance post of World Revolution. It is so regarded by those who know anything about it. It is so regarded by those who ordered the deportation of L. C. A. K. Martens, the "Soviet Ambassador." Martens was announced to be here for the purpose of opening up trade relations with the United States. He had a vast fund of gold—indeed, it was to explain his gold hoard that he used the story about trade relations. The Government of the United States judged, however, that his purpose here was World Revolution—and the government was right.

Jewish Visitors at Soviet Offices

MARTENS has departed but the Soviet Embassy remains. As stated in a former article, Martens' successor is Charles Recht, who is a Russian Jew about 36 years of age. In the same building with Recht is Isaac A. Hourwich, another Russian Jew and attorney, whose office is supposed to be the headquarters whence proceeds much of the Russian Bolshevik propaganda.

Now, the people who go to the offices of Recht and Hourwich are the same people whose names we have been tracing all through this interlocker, with some notable additions. Into the sanctum of ambassadorial Bolshevism in the United States, come, of course, Recht the representative and Hourwich the attorney for Lenin and Trotsky in this country.

Another caller is Judah L. Magnes, head of the New York Kehillah. He is a rabbi without a synagogue, an extreme extremist, a master of the language of agitation, and pro-Bolshevist in his influence and associations. He is credited with being the mediator between rich Jews and radicals when the latter are in need of funds. This is the Judah L. Magnes, head of the Kehillah, who tried to tell New York newspaper reporters what a weak and innocent foundling the New York Kehillah is; the same Judah L. Magnes whom the *American Hebrew* tried to picture as a diaphanous idealist broken-hearted because the ghetto doesn't fall in with his educational schemes. The Kehillah is *not* an educational institution; it is *not* a welfare institution in the charitable sense; it is a nerve-center of Jewish power; in Rabbi Magnes' own words, "a clearing house"; and if it amounted to nothing politically and nationally, the men who are now prominent in it would soon desert it. Kehillah is just what the word signifies—the whole Jewish community.

Then, of course, there are Benjamin Schlessinger again, president of the Ladies' Garment Workers, and Sydney Hillman, president of the Amalgamated Clothing Workers, and Joseph Schlossberg, another Amalgamated official whose Bolshevik utterances were quoted earlier in this article, and others of the Hebrew trades crowd whose radical relationships have been shown.

In addition, there are certain immigration inspectors from Ellis Island—all Jews, of course; occasionally a courier from Russia who has slipped into the country for a secret purpose; occasionally also a courier to Russia bearing messages from Recht and Hourwich.

Then I. W. W. leaders—Jews. Among them Baletin, secretary of the I. W. W. Metal Machinery Workers' Branch, and Peltner, joint secretary of the I. W. W. branches in New York.

In close touch with these Jewish radicals are a number of revolutionists of other countries, representing various violent programs against the established order.

It is through the office of Charles Recht that passports, issued by the State Department of the government of the United States, are being viséd. This statement refers to a regular practice known to have been followed until a few days preceding this writing, and there is no reason to believe it has since been altered. Ambassador Recht, or Acting Ambassador Recht, or whatever he may be called, is in close touch with Soviet authorities and has full notice of all their intentions regarding American affairs.

A frequent subject of conferences in Recht's office is the Soviet propaganda in America. Men like Hillman and Schlossberg and Schlessinger are merely laison officers between the Soviets and the Hebrew trades unions. The orders received from Moscow are thus transmitted to the Jews in America, and are obeyed along perfectly defined lines.

Racial Radicalism Established

OF COURSE, Rabbi Magnes, head of the New York Kehillah, could hardly be expected to remain in ignorance of what the whole Kehillah knows. And that Magnes is temperamentally a radical, any two-minute perusal of his speeches will show. He is head of what Schlessinger calls the "gigantic, wide-branched Kehillah," the foremost political racial organization in this country, a close community of a single racial type which has its own code and its own customs and its own method of gaining its ends.

This is not the whole story by any means. Schlessinger and Schlossberg and Hillman and the rest are leaders, but they are not the higher ups. The connections run straight up to the lofty heights of those who dwell in palaces and sway the finances of the nation, and to those who play large parts in the government of the United States. The Jews who finance radical publications—good conservative Jews who form the standing illustration in the argumentative question, "What possible gain can they hope from Bolshevism?" Jews who pull official wires to gain immunity and privilege for known traitors and revolutionists. Jews who replenish the coffers of dangerous elements. It is a long story, and all of it does not require telling, for the point to be gained is not that everyone should be told, but that the involved persons should be aware that it is known, proved, safely put away, in hope that the occasion to use it may never come. However, it is due the public to tell at least a part of it.

The Jewish leaders never played so stupid a card as when they endeavored to minimize the Kehillah and the place it fills. Nor did their Gentile echoes ever fall for so miserable an imposition.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost

Jewish World Notes

Supreme Court Justice Benedict, of Brooklyn, New York, sounded a public warning against the prevalence of rabbinical divorces. It came during his hearing of a Jewish divorce case. "This case smacks of collusion," said the Justice as reported in the New York *Times*. "It appears among other things that the plaintiff paid some rabbi to give a so-called 'ghet' or Jewish divorce, and that he subsequently brought this action.

"It seems to me that our criminal law should be made to cover these rabbinical divorces. The rabbis know perfectly well that they are taking money under the false pretense of giving the parties something of value, and they know also, or ought to know, that the act is against the law. A law which would impose a heavy fine or jail sentence, or both, upon any rabbi issuing these illegal papers would have a tendency to stop the divorce evil."

Alderman Bruce M. Falconer, of the New York Board of Alderman, precipitated a storm by voting against giving the freedom of the city to Albert Einstein and Chaim Weizmann, recent Jewish arrivals in New York. Mr. Einstein is the man who Sir Oliver Lodge says "introduced Bolshevism into science," and Mr. Weizmann is the inventor of TNT, the most deadly explosive of the war. The alderman, of course, was immediately charged with "anti-Semitism," and his Jewish colleagues on the board shouted threats of political extinction for him. Alderman Falconer denied being anti-Semitic; he said he was only protesting against conferring the freedom of New York on an enemy alien which, because of his German citizenship, Mr. Einstein is claimed to be. It is very clear, however, that it is only because Mr. Einstein is a Jew, and not because of his very doubtful theory of relativity, that the freedom of the city was thought of for him. Many greater and more useful men have been allowed to slip in and out of New York without fuss, as was proper. Had Mr. Einstein been a non-Jew, his theory would never have been exploited. Jewish publicity service attends to that.

A former Commander of the G. A .R., Benjamin A. Ham, of South Boston, made an address during the recent meeting of the G. A. R. National Staff Association in which he mentioned the Jewish influence in dress, theaters and motion pictures as destructive of Americanism. "It is the duty of the Grand Army of the Republic in its remaining days to stand like a wall against these destructive sentiments of Central Europe," he declared. There was, of course, the usual protest from Boston Jews.

Billy Sunday was evidently nettled by the exposure of the fact that he had chosen what he thought was the popular side of the controversy *by denouncing* THE DEARBORN INDEPENDENT'S *articles before he had read them*. In his reply, made evidently as soon as he got a copy of the exposure into his hands, he showed still more conclusively that he hasn't read them yet!

The United States Department of Agriculture reports that 98 per cent of the cattle, 98 per cent of the calves, and 15 per cent of the sheep and lambs slaughtered in New York come under Jewish kosher regulations. The report says: "The fact that the kosher trade uses only the forequarters accounts to a considerable extent for the large number of animals required to supply that class of trade. The hind quarters are always sold to the gentile (small g) trade. In New York City and Philadelphia the ribs are sold to gentiles, in addition to the hind quarters."

The report continues: "The kosher system of slaughtering differs somewhat from the general custom among the gentiles, and one of the prime requisites is that the animal bleed thoroughly. For that reason the animal's throat is cut without first being stunned by a blow on the head, as is done in other killing."

Is it quite tactful, do the Jews think, to boast so much about their influence with Secretary Hughes and Secretary Hoover?

"Who is going to run this country of ours—we Americans, or some other people?" demanded James W. Gerard, former ambassador to Germany, in a speech before the High Twelve Club, a Masonic organization, in Carnegie Hall, recently. "We are told when there is a speech to make or a discussion to be held, that we must not say this for fear that we may offend some foreign element in the country, and we must not say that because we may offend some other element. Now, I say the time has come in the United States when Americans must have something to say—something definite and unmistakable. Gentlemen, let us take hold of our own country and run it ourselves."

How Many Laws Too Many Have We?

Dangerous Tendencies and Wasteful Are Involved in the American Burden of Over-Legislation

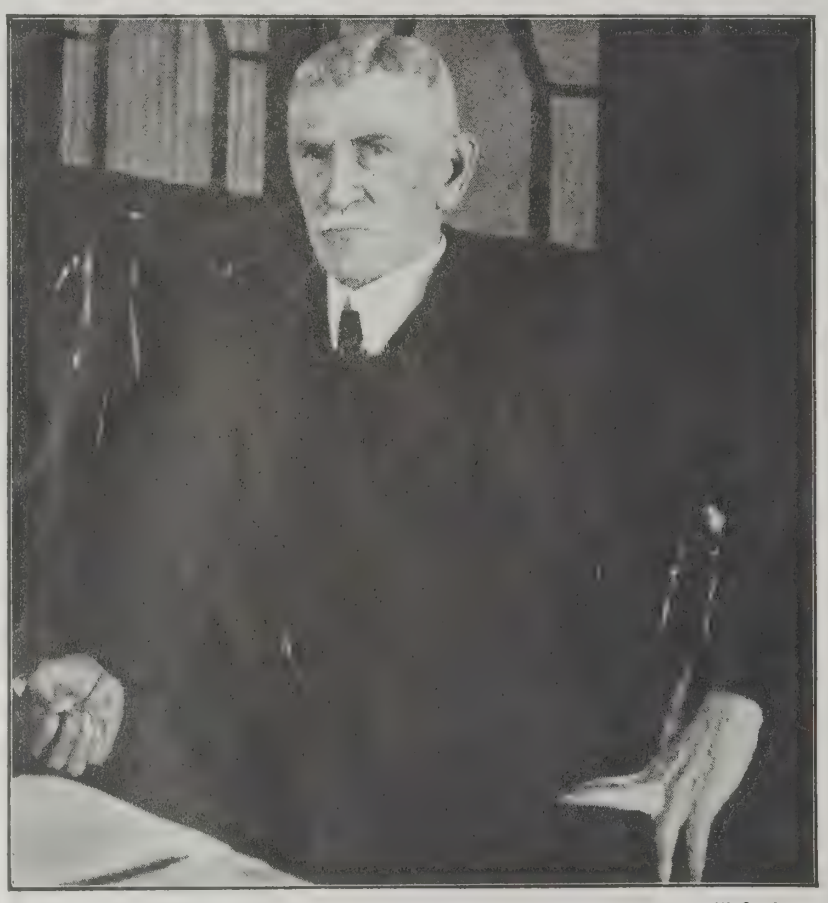
By CHARLES S. THOMAS
Former United States Senator From Colorado

A GOOD many years ago Herbert Spencer directed the attention of the public of Great Britain to the fact that legislation in free governments tended more and more to place restrictions and impose penalties upon all of the various activities of the individual, repealing statutes upon the same subject when the original ones proved unavailing or unsatisfactory, until its societies were irritated and pestered with multitudinous statutes and laws of a regulatory character necessarily requiring the multiplication of bureaus and official agencies for their enforcement, enlarging the burden of taxation because of the enormously increased expenditure necessary for their administration, and ending, or threatening to end, in a despotic legal condition or in the collapse of the social and economic fabric. This he declared to be the most serious of all consequences of so-called free government, when the statesmanship and the caution of those in authority yielded to and thus accelerated that tendency.

I think that the history of the United States and of the forty-eight states composing it confirms the existence of this evil, the difficulty of checking its operation, and the unfortunate and sinister consequences which must flow from its repeated exercise.

I have been informed that during the last twenty years the states and Congress together have placed 79,000 laws upon the statute books, most of them designed to produce a better social and political condition by legislation, and many of them relating to the same subject, which seems to have been improperly or unsatisfactorily dealt with at the beginning.

The nation is not so happy now as it was twenty-five years ago. We are more discontented, more dissatisfied with our condition and that of the body politic, and therefore we are clamoring for more statutes.



Breeds Discontent

I CONCEDE that the purposes of many of the laws passed are most benevolent ones, most beneficient ones, most humane ones. This nation, however, is going through the travail of reactionary conditions, through the operation of inevitable economic laws whose processes have already begun. The year will be a hard year for producer and consumer. Business is depressed. These untoward conditions breed discontent and sometimes disaster. There is no royal road to prosperity—certainly no legislative road, through which these conditions can be avoided. We must meet them and overcome them in the good old way, as we did in 1837, in 1873 and in 1893, and those whom we have educated to believe that they will find their panaceas through legislation will be bitter in their resentment toward those who fail to extend them, or who, attempting to extend them, shall not measure up to the limit of expectation. But one can no more suspend the operation of universal economic laws than he can obstruct the tides of nature. The power of human legislation is limited. Nothing that we have attempted to regulate is quite so satisfactory as it was before the attempt was made. Nothing that we propose to regulate by bringing it within the dominion and jurisdiction of a government bureau will be improved by that process. But we have reached that situation in our constantly expanded jurisdiction and we have yielded so long and so consistently to the demands of any interest sufficiently strong politically to influence our action that it is the most natural thing in the world, when a man's business becomes bad and untoward conditions confront him, he should run to the government of the United States for relief. The Federal Government has become to the popular conception a paternal, all-wise, all-powerful, all-resourceful institution, possessing omniscient authority and unlimited wealth, both of which should be used for the correction of all the mistakes and the reparation of all the misfortunes of its people.

If we continue this infinite series of legislation affecting the person, affecting his association with his fellow man, affecting domestic affairs, affecting his business, we will soon affect his politics, arouse his hostility, and, by our irritation, possibly alienate his loyalty to the government, which is charged with the duty of protecting and not persecuting.

But there is protection and protection. The principle of protection is not unlimited. The nation is now protection mad. Because of it, instead of the lobby which President Wilson is said to have destroyed in 1913 there are in the city of Washington more than a hundred lobbies, each charged with some particular mission, interested in some specific subject, and all aimed either at congressional legislation without an appropriation or with one; generally the latter. The establishment of some of these institutions necessarily leads to the establishment of others. The policy becomes infectious, and it is nearly all prompted by group selfishness. Few, if any of them, have given thought to or are greatly concerned about the general interests of the people of the United States or to the needs and welfare of the republic as a whole.

Much of our legislation is hasty legislation. All hasty legislation is bad. Legislation thus passed because confronted by an emergency condition, nationwide in its effect, is about the most dangerous pastime Congress can indulge in. It is true that some bills have been offered as emergency legislation for a limited period, but Congress has never in my experience enacted any emergency legislation without establishing precedents for other emergencies, and nearly all such legislation has eventually become permanent. Before the expiration of the limitation some influence, some interest, some political power behind the bill will thunder at the gates of the Capitol for another extension. It will be equipped with abundant excuses, one being that the initial period has not given the necessary time for the new statute to function.

(C) Press Ill. Service

SENATOR THOMAS OF COLORADO

In a speech in the Senate, Senator Thomas, without attacking the League of Nations Covenant, but by analysis of the proposed League in the light of history and the present situation throughout the world, delivered one of the most paralyzing blows yet suffered by the ex-President's followers in this fight. Until making this speech, Mr. Thomas recently was counted among the faithful Democratic adherents of the League scheme.

Apart from the sinister effect of lobbying influences upon legislators and legislation is the more serious effect which national organizations for the promotion or prevention of legislation peculiar to themselves have upon the element of national unity. These multitudinous organizations spreading all over the country and represented at the capital by their duly appointed delegates are necessarily selfish; they are largely self-contained. They repel mutuality of purpose, unless logrolling, as it is called, becomes necessary, and the policy of "I pat your back if you will pat my back" obtains. Such mutuality is always demoralizing.

Bureaucratic Perfection

WHAT has not yet been bureaucratized will be before the nation is five years older. I think I am safe in asserting that one-half of the bills that are enacted into law by Congress require for their operation and administration a bureau or a board or a commission, and once it is created it becomes immortal. It defies time, tides, and the threatening processes of political instability. Any attempt to remove such law is met by truculent political opposition, with the result that members damn them in the cloakroom and vote for them in the Senate. Many members are for any given bill because they dare not be against it. Senators are afraid of the lobbies, especially since they now help each other and expect mutual favors. The only thing on earth that stands between most of these organizations and legislation is the absence of a roll call, and as soon as it is ascertained that a roll call will accomplish all that is desired, some one will always see that it is had.

What we need above all things else today for the commonweal is unity, oneness of national sentiment and purpose. We are divided racially, industrially, economically; the cement which binds the people of the states is disintegrating and disappearing in the jarring contention of conflicting interests—economic, political and social. The process will continue unless Congress, recognizing this sinister situation, shall taboo all systems and species of Washington lobbyism. Left to itself, the evil will grow and the disintegration continue, with deplorable consequences to the country.

During the last session of Congress I think I received about twenty-five or thirty letters and telegrams from the good women of my state calling upon me to support a certain measure; and I was satisfied that the ladies of the other states had been just as busy with their representatives in Congress as mine had been with me. It is pretty hard to refuse a good woman, a conscientious woman, and it is equally hard to refuse a good and conscientious man. I know how hard it has been. Therefore, while we wished them in Tophet when we were in the cloakroom, we would sing their praises upon the floor and tell them how ready we had been for years to vote for this or similar legislation.

That sort of support to me, however, means absolutely nothing. I will guarantee that I could take any measure that has promise of an appropriation for local expenditure and I can get the support for it of practically all of the men and women of the state where the money is to be expended.

It counts, of course; it counts so much that we legislate in the Congress not according to our convictions but according to the demands of our constituents; in other words, we are no longer Senators; we are delegates; we are becoming rubber stamps.

We used to keep one ear to the ground, but now we keep both, and as soon as we think we know what the prevailing sentiment is at home we are able to make up our minds. As a result leadership, statesmanship, originality of legislation, the standards of the Congress and of legislatures have been transformed, and when the whip cracks outside we get into line. This is bureaucracy in action.

Treasury Siege Perennial

A MAN can not be a Senator or Representative and be true to himself and serve the people of the United States to the best of his ability if he yields his judgment or conforms his action to the persuasive efforts of organized interests, political or otherwise; we must either be representatives or delegates.

If members of Congress are sent to Washington merely to record the will or the demand of those interested in national legislation, because seemingly formidable, they serve neither the country nor themselves. They cease to be representatives. Their places may be important to them; they cease to be important to any one when their functions are performed with an eye single to their continued enjoyment.

Once I declared the breed of Treasury watchdogs to be extinct. I was mistaken. There are more watchdogs of the Treasury than ever before, but they are watching for an opportunity to break into it, and if the opportunity does not present itself they make it. The siege of Balaklava was not a circumstance compared to the perennial siege of the Federal Treasury. Everyone who thirsteth is there with his own watchdog, many of them in the two Houses, watching for an opportunity to increase their compensation, secure added appropriations, swell expenditures, and thereby increase the burdens of taxation.

Hasty legislation not infrequently means unconstitutional legislation. A man is a fool who in the Congress of the United States questions the constitutionality of any bill in these days. He only provokes ridicule, if not pity and contempt. What is the Constitution between appropriation bills and their exponents? What does it amount to in the face of an overwhelming petition of those who are interested in a given measure? In the first place there will be very few who will question it in the courts unless it immediately concerns them, and in the next place any and everything seems now to be in the power of the Federal Congress that the judgment, the whim, or the caprice of its several members seems to think desirable.

If such legislation as has been before the Congress in recent times had been supposed even a remote fantastic possibility in the early days, the Constitution of the United States would have been rejected and with it the Federal system. One of the objections most frequently urged against its acceptance was the possible extension of the powers of the General Welfare Clause into the domain of the states; but the absorption of their police powers through social and economic regulations and the use of public monies for their local administration and enforcement was neither foreseen nor imagined.

What Farmers Expect of New Administration

By E. E. MILLER

EIGHT years ago, when the appointment of Mr. Houston as Secretary of Agriculture was announced, a surprised and disappointed southern farmer commented thus on the news: "House-ton, Hooston, whoever or whatever he is—where in the dickens did the President find him, anyhow?"

Nobody asked such a question when the appointment of Secretary Wallace was announced. The farmers of the country knew him—knew of him, at least, and thought of him as one of themselves. Mr. Harding made a good impression on the farmers when he selected Mr. Wallace for Secretary of Agriculture, and he strengthened that impression when he declined to change his selection on account of the opposition of the packers. Many farmers do not favor the proposed packer regulation bills; but almost to a man they would have resented a packer veto on the choice of a Secretary of Agriculture.

The President has made a good start, then, with the farmers, both in his selection of agriculture's representative in the Cabinet and in his oft-repeated expressions of interest in the development of a more profitable agriculture and a finer and more satisfactory type of farm life. In all that he has said along these lines, however, he has talked only in the widest generalities, and farmers are not going to be satisfied with generalities. They are going to expect a great deal of the new administration. Mr. Harding's own words are responsible for part of these great expectations; the general feeling that farmers lately have not been getting all that was justly coming to them is responsible for part of them; the deliberate conviction of the majority of thinking farmers that they must have certain specific things in a legislative or administrative way to enable them to hold their own in the business world is responsible for still more of these expectations.

The First Thing Expected

WHAT things, then, we may ask, are these that the farmers expect of Mr. Harding and his party and what are the reasons for these expectations?

First of all, they are expecting that the administration make an effort, at least, to look at things from the farm point of view, that it have a sympathetic understanding of the farmer's particular problems and conditions. The evident lack of this understanding alienated the farmers generally from Mr. Wilson's administration, despite a record of constructive legislation of direct benefit to agriculture unequaled in any preceding administration, or in any three or four of them. The Federal Land Bank Act, the National Warehouse Act, the establishment of the Bureau of Markets, the inauguration of cost of production studies, and the development of the grain standardization work by the Department of Agriculture—these are all matters of vital importance to the farmers of the country. But the average farmer could not be expected to feel very grateful for them and what they might do for him in the future when he saw the administration apparently forgetting his interests, or failing to understand his most fundamental problems. A new policy in this regard, farmers will certainly and justly expect.

In the next place, farmers are going to expect a definite legal recognition of their right to combine for the marketing of their products. A bill to assure them of this right passed both Houses of the last Congress—amended so as to be valueless by the Senate—and then died in conference. Farmers do not feel exactly pleasant over this, and they are going to insist on the early passage of a satisfactory measure. Mr. Harding is definitely committed to such legislation and to the general policy of promoting co-operative activity among farmers. It is strange, from the farmer's point of view, that there should be any opposition to this policy, except possibly from the comparatively few people who profit by having the road from producer to consumer long and tortuous rather than short and straight. The farmer cannot understand, either, why his right to join with other farmers in the selling of his products so that he may have a voice in the pricing of them, as he now has not, should ever have been questioned. When he forms such associations and goes into the market place to bargain on equal terms with the buyer of his products, he is doing exactly what labor does when it forms a union and insists on helping determine its own wages, or what capital does when, by organizing a corporation, it masses the strength of many men for more effective business dealing. The farmer must learn to sell to better advantage, or one of two things will happen. Either farming will become so unprofitable that it will be hard to keep sufficient people on the farms to supply the country with food, or else the purchaser of food will have to pay ridiculously high prices for it. No man who has any real understanding of the situation can ever imagine that present prices of farm products, comparatively speaking, can be a permanent thing in this country of increasing industrial preponderance.

Present System a Scandal

INDEED, the present system of marketing farm products is a sad commentary on our boasted business efficiency. It is little than a national scandal that out of every dollar the consumer pays for food, only 45 cents should be paid for the production of that food, while 55 cents is paid for getting it from the producer to the consumer. Before the Great War, the Danish farmer, exporting his bacon and dairy products to England, got 60 per cent of what the British consumer paid for them. He got this larger per cent because he knew how to market co-operatively. The development of co-operative marketing by the farmers of this country is a matter of prime importance to them and of increasing importance to the consumers.

Of course, the government cannot develop such a system of marketing. Great business changes of this kind are not the result of legislation, but of the gradual development of economic forces. The shortcomings of the present machinery of distribution must be corrected by the people who raise food to sell and the people who buy it. At the same time, legislation and governmental policies can help or hinder the progress that is being made along this line. The farmer has a right to expect help from the incoming administration. A continuation and extension of the work of the Bureau of Markets, such strengthening of the National Warehouse Act as time may show needed, continued cost of production investigations, close observation of foreign markets and foreign trade tendencies—all these will help the farmer to sell his products to better advantage.

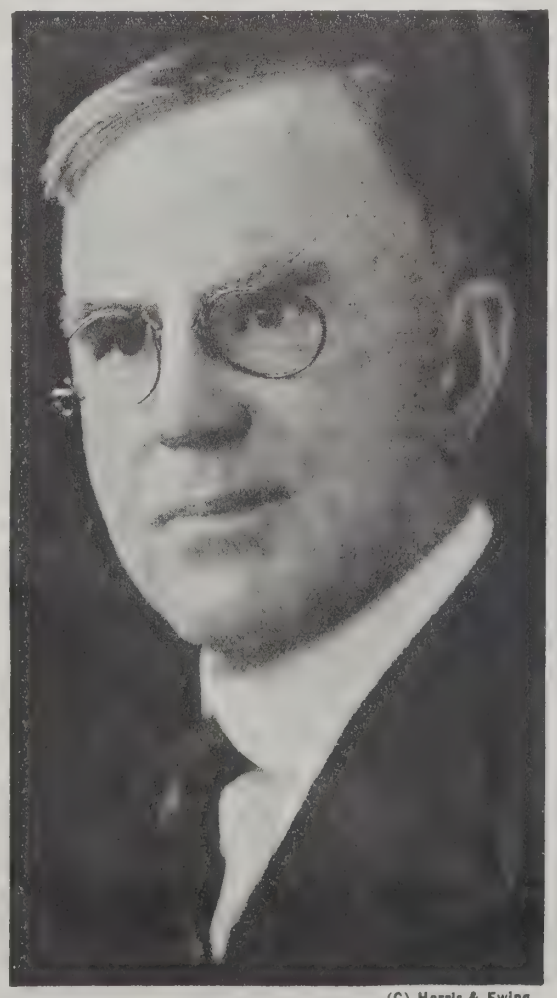
Credits Must Be More Flexible

THE farmer is expecting, too, and with right, the development of a more adequate and more flexible system of farm credits. Until the passage of the Federal Farm Loan Act, there had never been in this country any attempt by the national government to provide a system of credit to meet the needs of agriculture. The Farm Loan Act has already justified itself. It needs to be strengthened in some ways and extended; and to have as a companion to it legislation that will provide short-time personal credits for the rural districts. The need for such credit, the right of farmers to it, especially of farmers of small capital and little available collateral, and the beneficial effects certain to flow from sound legislation along this line, are all admitted by every student of this problem. Present banking systems, serviceable as they are to him, were not made for the farmer, and do not fit in with his conditions. A thorough study of the various proposals for making the farmer's potential credit resources available to him, and the early enactment of a carefully thought-out short-time credit act are things farmers will insist upon.

Farmers, again, have a right to insist upon more consideration than they have had in the making of tariff laws. Most tariffs have been written primarily to protect the manufacturing interests. The farmer has come to the place where he insists upon his share of "protection." There are high-tariff farmers and low-tariff farmers, but they are all going to insist that farming be given equal treatment with other industries in tariff making. This, in the long run, is going to mean an overwhelming rural protest against excessively high tariff rates. For this country is still a large exporter of farm products and the prices of all these products are largely determined by the prices of the export surplus. Unduly high import duties on manufactured goods are bound to add to the farmer's burdens, even though the duties on foreign farm products be sky high. As long as he produces a surplus that must be sold abroad, international supply and demand are going to be the most potent factors in the fixing of prices of farm products. The farmer will no longer be satisfied to go "unprotected" while other industries are bolstered by high tariffs, but it would be quite possible to "protect him almost to death."

Probably no pre-election promise of Mr. Harding pleased the farmers more than his promise of giving agriculture representation on the great semi-judicial and executive bodies that have come to play such an important part in our scheme of government. The Tariff Commission, for example, the Interstate Commerce Commission, the Federal Reserve Board—on these the farmers feel they have a right to be represented. The feeling is justifiable. The decisions and recommendations of these and similar bodies affect the farmers directly and often vitally. Right now, whether rightly or wrongly, most farmers are blaming the Federal Reserve Board for hastening the processes of "deflation" at the expense of agriculture. In whatever has to do with transportation or commerce, the farmer has an interest exceeded by that of no other class of business men.

And There Are Other Things, Too



THIS brings up the still unsettled questions of the railroads, of the waterways, of the public highways, and of the adjustment of all these to and with each other so as to give us a thoroughly serviceable and truly national system of transportation. It is becoming increasingly evident that the past policy of considering one means of transportation without regard to any of the others cannot solve the problem of cheap and speedy transportation. That it be solved, the welfare of the whole country demands, the welfare of the farmer especially. The value of his products is often determined by the ease with which he can get them to market. Whenever the means of transportation are lacking, or fail to function, the farmer's profits decrease and his place of residence becomes less desirable as a home. Every facility that brings him into closer touch with the outside world adds to both the profit and the pleasure of farming. The farmer has a right to expect from the approaching administration some real study of the whole big problem of transportation.

In addition to these matters of domestic policy, farmers are expecting—probably first of all—peace. A definite understanding of our international relations and a chance to get back as far as may be toward normal business relations with other countries are of vital importance to American agriculture.

Peace, actual and technical, and a settled foreign policy, must prepare the way for agricultural progress and prosperity.

The New Secretary of Agriculture

LIKE his immediate predecessor, the new Secretary of Agriculture, Henry C. Wallace, is a typical product of the Corn Belt. As Edward Meredith was a practical farmer and editor of a successful farm weekly, so Henry Wallace has held high place in the esteem and affection of a large agricultural constituency in Iowa, Kansas and Nebraska as a man whose knowledge of farming and its problems is born of practical experience and so could be trusted. For many years *Wallace's Farmer* has been a farm authority in the Mississippi Valley. The two men were neighbors in Des Moines and friends, despite their variance in political affiliation.

(C) Harris & Ewing

HENRY C. WALLACE, Secretary of Agriculture.

Specializing in stock raising and dairying, Secretary Wallace has from the first given earnest attention to the fullest development of his natural vocation and his fondness for farm life. In the best sense of the term, he is a scientific agriculturist, a modern cultivator of the soil and exponent of modern ideas and methods in the basic industry of the nation. Availing himself of every opportunity to obtain fuller knowledge, he has been quick to put his knowledge to the practical test in experiment on a constantly expanding scale, so he may rightfully be ranked with those whom a French philosopher declared are the true benefactors of mankind: the men who make two blades of grass grow where but one grew before.

Born at Rock Island, Illinois, 55 years ago, he was educated in the public schools and at the Iowa State College of Agriculture and Mechanic Arts, of Ames, Iowa. Soon after winning his B.S.A. degree, he established himself on a big farm in Adair County, Iowa, as a general farmer and breeder of thoroughbred live stock. For three years, beginning in 1893, he was also professor of dairying in Iowa State College. These experiences led up naturally to the newspaper career in which he has become since so well known, for he combined his professorship with the editorship of the *Creamery Gazette* and *Farm and Dairy*.

In 1895 he became manager and associate editor of *Wallace's Farmer*, in which position he continued until February, 1916, when he became editor, shortly afterward acquiring control of the publication. He is now president and treasurer of the Wallace Publishing Company and of the Capital City Printing Plate Company at Des Moines; a director of the Central State Bank and a member of the executive committee of the United States Live Stock Industry Commission, while he has been secretary of the Corn Belt Meat Producers' Association for 15 years. He is also permanent chairman of the National Shippers' Conference.

During the war, Mr. Wallace served as member of the Y. M. C. A. National War Work Council, and of the International Committee, in addition to being chairman of the Iowa State Executive Committee. A lifelong Republican, he is a member of the United Presbyterian Church and a "good mixer" generally. There is every prospect of his keeping the Federal Agricultural Department up to a high standard of efficiency and usefulness, and perhaps to set new standards that will mean much for the advancement of American farmers and farming.

A New Type of Producer

By JOHN B. WALLACE

FOR the past decade the motion picture world has been sadly in need of new blood. The production end of the game has been dominated by two classes of men; the dreamers who wished to do great, almost impossible things but were lacking in business ability and commercial training, and the men who viewed the films as purely a commercial proposition and were willing to prostitute the screen with any type of picture that would bring in the money. The first class of producers had wonderful ideas but have failed because of the lack of business instinct, the second class has succeeded financially but has brought the industry to the verge of ruin through their moral callousness.

What was needed was a producer who combined sound financial sense with high ideals and in Benjamin Bowles Hampton the screen obtained an accession that completely filled the bill.

Hampton comes of good American stock on both sides. The Hamptons and Randolphs of Virginia and the Bowles of New England are of the oldest white families on our youthful continent. Mr. Hampton is in his forty-sixth year, is married and has five children. He is a clean-minded, clean-living citizen who is ready to fight at the drop of the hat for a principle. Time has tempered his radicalism but has not tempered his fighting spirit.

Hampton comes of a newspaper family and at the age of fifteen he was running true to type—no pun intended—by conducting a country weekly at Macomb, Illinois. When twenty he moved to Galesburg, Illinois, and ran a daily and weekly paper for five years.

He then succumbed to the lure of New York where he first engaged in general journalistic work and then went into advertising.

The advertising agency which he established proved to be very successful and finally he was tempted to try the publishing game. He bought a publication that was on its last legs, renamed it *Hampton's Magazine* and in a few years had increased its circulation from 12,000 to 440,000. But Hampton had tried to do what is practically impossible for a man without unlimited capital; that is, to run a strictly independent magazine.

He went after the big corporations, especially the railroads. His attack was so vigorous, his facts so unassailable and his logic so convincing that the interests became alarmed. They resolved to put him out of business and using the old tactics of frightening his stockholders and shutting off his bank credit they succeeded. In 1911 Hampton gave up his magazine and flat broke set about looking for a job.

While conducting his advertising agency Hampton had handled the advertising of the American Tobacco Company and when the Supreme Court dissolved the tobacco trust he was offered the position of vice president of the new company. In his new position besides having charge of the sales he looked after the public policies of the company in its relation to social and legislative affairs.

He was with this company for six years. Then the possibilities of the motion picture began to interest him. He invested some money in stock in various companies, and finally decided to go into the business himself as a producer.

Although the star system was all the rage among producers at that time, Hampton saw far enough into the future to realize that it was but a phase of a new industry and that the story was the thing. He tried out his theory with Rex Beach's novel, "The Barrier." When it was finished he was unable to sell it. The exhibitors told him he was crazy.

A picture without a star would be a frost. Finally he was driven to hire his own theater in New York in order to show it. The picture was such a success that the prices were run up to $1.50 a seat, a price never heard of for a picture house before. "The Barrier" is still running after seven years.

Hampton continued to dabble in motion picture stocks, biding his time to go into the game on the scale he desired. In 1918 he decided that the time was ripe to put his ideas to practical test. He went to California and spent nearly two years investigating producing conditions. Then he started lining up authors. Some of those whose works he obtained were Zane Grey, Winston Churchill, Stewart Edward White, Emerson Hough, Harry Leon Wilson, Vincente Blasco-Ibanez, Upton Sinclair, Owen Wister, George W. Cable, Gene Stratton Porter, B. M. Bower, Thomas Nelson Page and William Allen White.

He then proceeded to star the author and to pick the cast to suit the story, not to make the story to suit the star as had been the universal custom.

In his latest picture, which is not at this writing released, William Allen White's "A Certain Rich Man," Hampton has made a radical departure from the accepted type of picture. At a preview recently held it created a sensation among the newspaper men who viewed it.

In the same vigorous manner in which he went gunning for the men responsible for the abuses of corporation power, Hampton has gone after the men who are responsible for the prostitution of the motion picture. Last fall he declared war upon the pictures of sex appeal. In speeches and magazine articles he scathingly denounced the men who through the screen were corrupting the taste and morals of the coming generation.

At first the men behind the pictures were aghast at this attack from within their own ranks, but the wave of public sentiment aroused by Hampton and other agencies outside the industry convinced some of them that Hampton was right. Instead of fighting him they announced they were about to "clean up" the industry from the inside. Today he stands in the unique position of having his bitterest business rivals compelled

BENJAMIN BOWLES HAMPTON

to take action and aid him in his crusade against the conscienceless producers.

"I felt the best way was to attempt to make the producers themselves clean houses," Hampton told me as we sat in his study at his beautiful home in the Wilshire district in Los Angeles. "When the public attempts to reform an industry it is apt to swing the pendulum too far and wreck the business. No picture should be shown upon the screen that is not fit for children to see. There is no excuse in art or plot for showing unclothed women in the pictures.

"Unexpurgated editions of classic authors are kept under lock and key so that the children cannot read them, yet these same children see in the picture houses every day illustrated stories that would put to shame the ancient writers.

"The trouble with the picture industry is that the men at the head of it have not fully realized its scope and significance," he went on. "Not since the days of the entertainments in ancient Rome has there been a form of amusement with such universal appeal. Books and magazines have only a limited number of readers, limited because of lack of opportunity and education. The speaking stage also can have but a limited patronage because of the prices that must be charged and lack of theaters with adequate facilities. But motion pictures can go everywhere, can reach every type of humanity from the highest to the lowest. They need no elaborate stage settings. They can be shown in a barn if necessary. The audience does not need to be educated, not even literate to grasp the story. They are absolutely a new medium of expression, such a medium as has never been known before in the world's history.

"Another mistake that has been made by producers is that pictures are allied to the theater. This is perhaps because most of the men in the business today are recruited from the stage. That is why the star system was adopted and why the spectacle picture became dominant. But it is, in my opinion, a mistaken view.

"The action in a motion picture is much more closely allied to the action in a novel than it is to a play. A play must have a series of dramatic climaxes to be a success. A novel tells a story, it may be dramatic or it may not. The screen can be made to tell that same story and tell it smoothly like the novel told it, not in a series of big climaxes.

"The script is the big thing, in fact the whole thing in a motion picture. A certain responsibility rests upon the director and upon the actors but if it isn't in the script it isn't in the picture. That is only logic. The whole picture industry has been based upon false and illogical premises. First the actor, the star, was the whole thing, next the director was featured, but now at last they are coming to see that it is the writer and the writer alone who is really important."

Mr. Hampton spends but very little time with the camera man during the actual filming of his pictures. But in his study is a big white screen and there every shot is gone over carefully. If a friend has a daughter or sister whom he wishes to put in the pictures, Hampton wastes no time in questions or vain argument. She is told to go out to the studio and have some shots taken. Then the screen in Hampton's study tells the tale as to whether she will do.

In his study over his big garage this writer, publicist, financier and producer, who has regained in his pictures the fortune he lost in his magazine venture, plans his reforms. For Benjamin Bowles Hampton is essentially a reformer, a crusader. With his mixture of Puritan and Cavalier blood what else could he be?

How Senator-Scientist Views Farm Problem

Concluded from page 7

will flock to the cities as soon as they grow up. In fact, the most saddening aspect of many farming districts now is the scarcity if not the entire absence of young men and women who already have gone en masse to the cities.

"The problem is a farming one in the primary sense only. The matter of earnings is only incidental. The great question is keeping people, and the right sort of people, on the farms to produce the food the country's population must have. You must remember that no man is bound to the farm as was once the case; theoretically anyone there can leave as thousands and thousands have done.

"And they will continue to leave as long as the best prizes of life lie outside of farming. We are already on the verge of becoming importers instead of exporters of foodstuffs. When (if we should) we become dependent on foreign countries for food, our country will be in a dangerous position. If present tendencies continue that is liable to happen within less than ten years.

"It will be much easier to meet and solve the crisis before than after it comes. This is the lesson of other countries and of our own, in the last year or two, with regard to railroads and merchant shipping.

"The farmer must be recognized as a business man and industrialist and given the protection and the help that the country has given to other businesses and industries. He must have the credit facilities that go with sound business. He must be informed on national and international conditions that will affect the demand and the prices paid for his product, so that he may not produce surpluses that will be wasted for lack of market, and yet avoid deficiencies that may cause thousands to go hungry. He must have some say as to when and how he shall sell what he produces, just as other business men can hold or sell as conditions warrant. The processes of distribution must be simplified and cheapened, for the benefit of consumers as well as producers. Opportunities for speculation must be reduced. He must be enabled to keep up his plant, for that plant, as until recently could be done, cannot be duplicated whenever the old one wears out.

"The farmer must not only be enabled to live, without taking from coming generations the wealth Nature spent centuries storing in the soil and fairly to accumulate without depending on unearned increment; he must be enabled to live as other people live, that is, he must have his measure of the comforts, the recreations, the luxuries, as it were, which progress has provided cheaply for non-farmers. This means good and well-equipped homes, churches, schools, roads.

"The American farmer can do much through cooperation and he is now ready, as never before, to act in concert with all in his class. But he can't do it all. Others must help, and they should help, for the agricultural problems of the country involve farmers only incidentally. You must not forget that if famine came, the farmer would have first call on what food is available. Hence in the last analysis the subject is more important to city folk than to the farming population.

"Its importance may not be realized by city people now, though the tendency of food prices to remain high despite the collapse of farm prices should bring it home to them. What they should remember is that when the crisis comes they will suffer most and it will be too late to find easily applied remedies."

Government Success on Waterways

Concluded from page 3

retained in service. Old-type boats, mainly packets, with which the barges have been handled in the first stages of the development of this service, are being discarded as rapidly as the new towboats are delivered. While the 40 new steel barges will add much to the carrying capacity of the service, most of the old barges will be retained, the officials believing traffic soon will require all available carriers.

For the Warrior River service proper, between Mobile and Port Birmingham, towboats of lower power than those in use on the Mississippi are being installed. The first of these, the "Cordova" is in service as these lines are written, and two others, the "Demopolis" and the "Tuscaloosa," about to be delivered. These boats are of the same general type as the towboats described above for the Mississippi River service, but are smaller in size, being 140 feet long, 24 feet molded beam, and eight feet nine inches deep, with a draft of six feet. They are equipped to burn coal, but otherwise the propelling and other machinery and its location is the same as on the larger towboats.

Barges for use in this Warrior, Tombigbee and Black Warrior river service, are of wood, and of the open-hopper type. Twenty of these have been provided for use in the coal trade in and out of the Birmingham district.

The third branch of the service, between New Orleans and points on Mobile Bay, Warrior River, Tombigbee River and Black Warrior River, is getting four towboat-barges, which not only can handle cargo in their own holds and on deck, but can tow fleets of barges as well. These towboat-barges are 280 feet long, 49 feet beam and nine feet deep, drawing about five feet of water. They are planned to handle coal from the Alabama fields into New Orleans, and package cargo of general merchandise on the return trip from the Louisiana port.

Adventures of the World's Master Trickster

"Kellar the Great," Now Retired, Relates Experiences in Humbugging His Audience, the American Public

ALTHOUGH it was an American showman in the last century who enunciated the celebrated dictum, "The public likes to be humbugged," that principle has been known and acted upon since the dawn of history. Under such various names as magic, black art, necromancy, illusion, medicine-making, faking, sleight-of-hand, wizardry and spiritualism, the art of the trickster has been practiced in every age and in every clime. The ancient priests used it as an aid to religion, primitive people of all lands have had their superstitious instincts quickened by their medicine men and even in these modern times we find clever fakirs taking advantage of our awe of the unknown world through what is known as spiritualism.

Truly an ancient art compounded one-half of natural quickness of wit, manual dexterity and inventive ingenuity, and the other half pure nerve and assurance. The magician pits his wits against the public and wins invariably for several reasons. His audience is prepared to be fooled and he is prepared to fool them. He is in the advantageous position of a salesman whose customers want his goods. He knows perfectly every move that he is going to make while his audience is placed at the disadvantage of the unexpected. In addition to the native quickness of wit which he must possess to be a success in his profession, he is constantly making it sharper and keener by daily brushes with the public. Like a trained athlete he attacks and defends by instinct and he has the same advantage that a trained athlete has over a man of equal strength who is not in condition. A fourth advantage is in the fact that he seldom has to fool the same audience many times in succession. The most clever magician could not hope to face the same audience day after day with the same tricks and not be detected by some one.

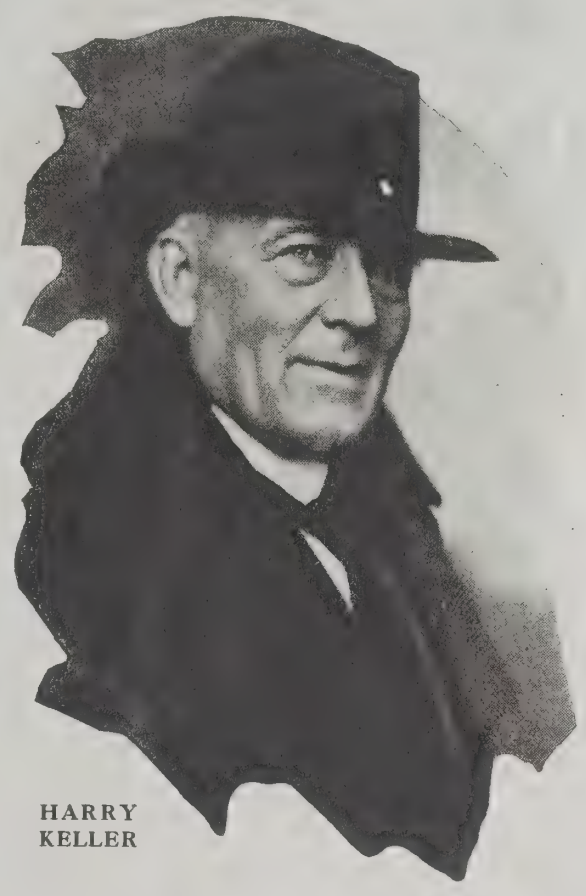
Keller Now in the Seventies

THE art of magic or illusion is one that is constantly growing in possibilities. Compare the paraphernalia that the old-time performers had to work with and that of the modern illusionist. It is like comparing the stage of Shakespeare's time with the spectacular productions of today. With all the devices of electricity and other inventions of modern science at hand it is small wonder that the illusionist can baffle his audience. But in the old days it took something more than ingenious appliances.

There is a man who has bridged the gap between the days when a magician was but a sort of sublimated juggler depending entirely upon his sleight-of-hand and his quick wit and the illusionist of today with his elaborate apparatus and mechanical paraphernalia.

Harry Keller, or Kellar as he was known on the stage, is now in his seventies. Ten years ago he retired from the stage and purchased the beautiful home in Los Angeles where he now resides. He had well earned his retirement after forty-seven years of active service as a magician and illusionist, during which time he had appeared in every country on the globe. But the old master three years ago proved that he had lost none of the cleverness which entitled him to be called "Kellar the Great" when he appeared at a benefit performance for the Antilles sufferers at the Hippodrome in New York. The ovation he received on that occasion is still the talk of theatrical circles.

Although retired, Mr. Keller is far from being a recluse. He still retains that quickness of intellect and vigorous energy that kept him for years in the forefront of entertainers. Los Angeles is second only to New York as a theatrical center and few are the stars of stage and screen who fail to renew their acquaintance with this well-beloved comrade.



Best Illusionists Are Americans

NOT only has Mr. Keller known every prominent member of the theatrical world but his acquaintanceship embraces statesmen, diplomats, financiers, sportsmen, authors, editors, musicians and ministers. It is difficult to mention a great man of the past sixty years whom Keller has not met. The walls of his home are lined with autographed photographs of celebrities ranging from Theodore Roosevelt, Queen Victoria, Mark Twain, Lillian Russell to Billy Sunday and Raymond Hitchcock. His library is filled with scrapbooks containing clippings from nearly every city and town in both the civilized and uncivilized world. Handbills in every tongue, some printed on silk, testify to the wanderings of this American magician. And speaking of Americans, Mr. Keller was asked who were the best exponents of his art. He answered, "Americans."

Further questioning elicited the fact that practically all the present top-notch illusionists are Americans born and bred. The foreign-sounding names of most of them are assumed for advertising purposes. Even the Hindoos, famed as fakirs, he says, are children compared with an American magician, their tricks being so simple that they are regarded as only in the primary stage of the art.

Keller was born in Erie, Pennsylvania, shortly before the stirring days of the War of the Rebellion. He attended school and during vacations worked in a drug store as a sort of general roustabout. When he was in his tenth year he heard that the Fakir Ava, a noted magician of that day, whose real name was Henry Hughes, wanted a boy to assist him in his performances. The boy Keller walked to Hughes' farm just outside of Buffalo to apply for the job.

"As I walked up to the house a black and tan dog ran out and escorted me to the front porch," Keller

HARRY KELLER

said. "Hughes met me at the door. He noticed the dog jumping up on me and licking my hands. 'That is a good omen,' he said, 'that pup has chased off about two dozen kids who came here for that job. I guess he has elected you.'"

Thus Keller started on the career that was to take him a dozen times or more around the world. Under Hughes he learned all the tricks of the trade and he proved to be an apt pupil. Keller was always blessed with a remarkable memory. One glance at a number, no matter if it runs into the millions, and he can repeat it to you twenty years after.

Fools His Former Partner

HE GAVE an instance of this power in an incident concerning Bill Fay, a former partner of his years before. He had left Fay in London and had not seen him for thirty-five years. Fay, who had quit the stage and settled in Australia, while on a tour of the United States, was a guest of the Kellers in Los Angeles.

One evening Keller, who is full of sly humor, said to him:

"Bill, do you know my wife is clairvoyant?"

Fay, who had been in the game too long to have any illusions about such things, laughed.

"What's the joke, Harry?" he asked.

"I am not joking. I'll prove it to you. What is your watch number?"

Fay confessed he did not know and started to pull the timepiece from his pocket. Keller stopped him.

"No, this is clairvoyance, not mind reading. What is the number of your wife's watch?"

Fay did not know that, either.

Turning to his wife Keller said, "Tell them the numbers, my dear."

Mrs. Keller promptly gave the correct numbers. Fay was dumfounded. Experienced as he was in the game this was something new to him.

"But how did you do it?" Keller was asked.

"Simple enough," he replied. "I remembered the numbers and had given them to Mrs. Keller."

"Suppose Fay had bought a new watch since you last saw him," I objected.

"I would have been stuck," Keller confessed. "But then you see I knew Bill Fay."

Keller has a system for remembering numbers. It is based on the phonetic system each figure having a certain sound. These sounds are associated in a sentence like the key sentences that medical students have for remembering the names of nerves or bones.

Keller also knows all the arithmetical shortcuts and tricks. He can cube any number that you give him under one hundred just as fast as he can write the number down. His mind works like chain lightning and after spending a few hours with him you little wonder that he can fool some of the most intelligent men of the world.

"How is it," he was asked, "that spiritualists can deceive smart men and scientists like Sir Conan Doyle and Sir Oliver Lodge?"

"The more intelligent the man and especially the more imagination he has the easier he is to trick," he told me. "Such men are always trying to figure out our tricks on a scientific basis and when they cannot do it they are stumped. Their egotism leads them then to believe that it must be supernatural. The hardest persons to deceive are unimaginative clods or children, especially the street gamin or newsboy. These sharp-witted kids are the bane of every magician."

The story of Keller's adventures would fill the pages of a large book. He has been in shipwreck, flood and fire. He has been stranded in a dozen countries.

He can sit for hours and tell tales of his adventures in different sections of the globe. And he can tell these stories with every name and date. His mind is like a page in which every event of his life is recorded verbatim.

Branded Agent of Devil

HE TOLD how he was stranded in Indiana in the early seventies; how he walked to Chicago, tried to steal a ride on a train and was put off in a cemetery; how he walked to Waukegan, Illinois, and was staked to a bed by a good-hearted bartender who also went good for the town hall the next evening where Keller gave a show without a single prop except what he himself was able to make during the day. He packed the hall for three nights in succession and was able to make enough to start him out again on the road. He told of another time when he was broke in Brazil and by enlisting the aid of the king, Dom Pedro, he was able to fill the largest theater in Rio and took away more than $5,000 for the engagement.

Another time when he was landed in a city without any props he had to substitute a kitten for a pig in one of his tricks. The kitten began to mew before it was time for the denouement and to drown out its wails Keller was compelled to mew with it.

He played in Mexico City in 1874 when Mexico was even a wilder country than it is today. The church issued a warning to its members that Keller was an agent of the devil sent on earth to trick men. The result was that the superstitious natives packed the theater at every performance and although every stagecoach that left the city was regularly robbed Keller never had to elevate his hands once while he was in the country.

He took more than five thousand dollars in gold doubloons out of the country packed in asphaltum and after nerve-racking experiences succeeded in evading both the robbers and the government officials.

Keller has played before Queen Victoria, Czar Nicholas of Russia, nearly all the principal rulers of Europe, the rajahs of India, the nobles of China and Japan as well as the big men of South Africa, Australia and South America. He has been staked when financially embarrassed by some of the greatest financiers of the world including the grandfather of the present Pierpont Morgan.

Successor Works With Inventions

KELLER was never especially clever with his hands. His hands are large and his fingers thick like a coal heaver's, as he described them to me. Because of this physical handicap he was driven to invent mechanical devices for most of his illusions. And as a result Keller is today the inventor of the greater part of the modern magician's paraphernalia.

Most of these inventions he has sold or bequeathed to his successor. Keller was the inventor of the famous levitation trick where a body is apparently suspended in the air. This trick while widely imitated has never been done the way Keller does it but by one person to whom the old master told the secret.

Although retired, Keller, true to the ethics of his profession, refuses to explain the thousand and one stunts of the illusionist. He makes one exception. He will expose any person who claims to do his tricks through supernatural aid. He has no use for anyone who uses his art to play upon superstition.

For years he exposed the tricks of so-called spiritualists and other noted fakirs.

"There is nothing a spiritualist can do," he says, "that I cannot do and show how it is done. It is all tricks. Like puzzles they are difficult until you understand them and then you wonder how you could have been so dense. Even an amateur magician can fool me with a new trick for a little while but I will eventually solve it by the process of elimination or figuring out the ways it couldn't have been done."

A Master Bandit Passes

Concluded from page 6

EMILIANO ZAPATA (in black, at left center of photo, marked by arrow below) and a few of the men of his notorious "Death Legion," the nucleus of his army. This photograph, as well as others showing Zapata in this story, was made at or near Cuernavaca, Mexico, in the winter of 1911 and the spring of 1912, when Zapata was making his remarkable rise to power in that republic.

Cruz, a few miles outside the American lines, meanwhile sending a messenger to Huerta, who had once whipped him, and was preparing to start a war of extermination against him, offering all his forces and himself, "to defend Mexico from the Dragon of the North." Huerta's reply either was never made, or never reached Zapata; in any event, it never became known. Huerta fled Mexico through the ancient port of Coatzacoalcos; the United States troops were withdrawn — without the much-wanted salute—and Zapata went back to the control of Southern Mexico.

While all these things were going on, the Carranza-Villa coalition in the north had risen against Huerta. With the wit of Palafox to lead him, Zapata sought a combination with Villa, who, in a few weeks, broke away from Carranza, but for some reason, never quite clear to me unless it were mutual distrust between the leaders, this attempt brought no results, and Venustiano Carranza marched into Mexico City. The Master Bandit, with nearly 25,000 men, the largest army he ever had gathered together, surrounded Mexico City, and captured, one by one, the suburbs of Tlalnepantla, Tacubaya, Tacuba, Coyoacan, San Angel, Xochimilco, Tlalpam, Milpa Alta, and half a score of small villages which dot the beautiful valley of Mexico. There he harried the Carranza forces until they withdrew into the heart of the City of Mexico, and Carranza himself consented to a peace conference at Aguas Calientes, in Northern Mexico, to be attended by delegates from the Carranza, Villa and Zapata factions, in which a provisional president, satisfactory to all, should be selected to serve until such time as all three could settle their difficulties. Carranza evacuated Mexico City, fearing that further fighting in the "City of Palaces" would injure his cause in the eyes of the world—and Zapata moved in, early in 1915.

With Garza's flight Zapata again seized Mexico City, but instead of controlling it as he once did, he began a period of looting seldom equaled in the history of the world. This sack of one of the most beautiful cities in the world attracted little attention. Beginning with the government offices, everything movable was taken, and the national pawnshop compelled to pay fat prices for all the loot. Every picture, many of them priceless oils, was stripped from the national palaces and from the churches, and the national pawnshop compelled to buy them. The magnificent homes of the Limantours, a marble palace which cost, unfurnished, $432,000; the Escandons, valued at $325,000; the Pardos, worth at a low estimate, $200,000, and scores of others, whose values ran into a total of millions, were looted and turned into stables for horses, while the upper floors were given over to the sandal-shod Indian women who follow every army in Mexico. The tiled floors of the magnificent Limantour home were torn out, because, as Zapata said, his "girls were accustomed to dancing on dirt floors, and they slipped on the marble." The library of the Escandon residence, consisting of something like 11,000 volumes, some of them going back to days prior to the Conquest, furnished the fuel wherewith these women of the army cooked the food of their men over small fires in the streets. Girls of the better classes disappeared from hundreds of homes. Proclamations informed the Indian population that the city belonged to them; that they could take such houses as they chose for their own and that, if they lacked food, they were at liberty to shoot any horses seen on the streets not in military service, and eat them.

Pressure was brought to bear on Villa and Carranza, and they persuaded Zapata to send delegates to another peace convention. This meeting never assembled, but Zapata, realizing that he could not hold Mexico City—since it lies in a bowl in the valley and is almost impossible of sustained defense—evacuated the capital when Lagos Chazaro, a former shopkeeper, of the state of Vera Cruz, was named provisional president. Chazaro ruled for about four weeks and disappeared; no one ever has learned where he went, but with his going, Zapata again seized Mexico City, and immediately thereafter Carranza gave him battle. The Carranza troops, numbering about 20,000 men, were commanded by Pablo Gonzales, quite the most capable soldier since Huerta. The Zapatistas, numbering rather more than this, were led by the Zapata brothers. As has been the case in every battle fought in Mexico City, the defenders were unable to hold out, and the Zapatistas were forced back, over the mountain wall, into Cuernavaca, capital of the state of Morelos.

Meanwhile, there had arisen in Northwestern Mexico a new military leader in the person of Alvaro Obregon, who, while supporting Carranza, defeated Francisco Villa, and gave promise of becoming the Man on Horseback, so long ago as the spring of 1916. With Villa defeated by Obregon, Zapata appears to have decided to remain quiet for some months, waiting for national events to shape themselves. He refused to ally himself with the Felix Diaz revolution in the south, and, after his withdrawal from Mexico City, also evacuated Cuernavaca and contented himself for nearly four years with solidifying his control of Southern Mexico, increasing his army, distributing lands to his followers, and otherwise setting up a sort of government within a government less than 100 miles from the federal capital.

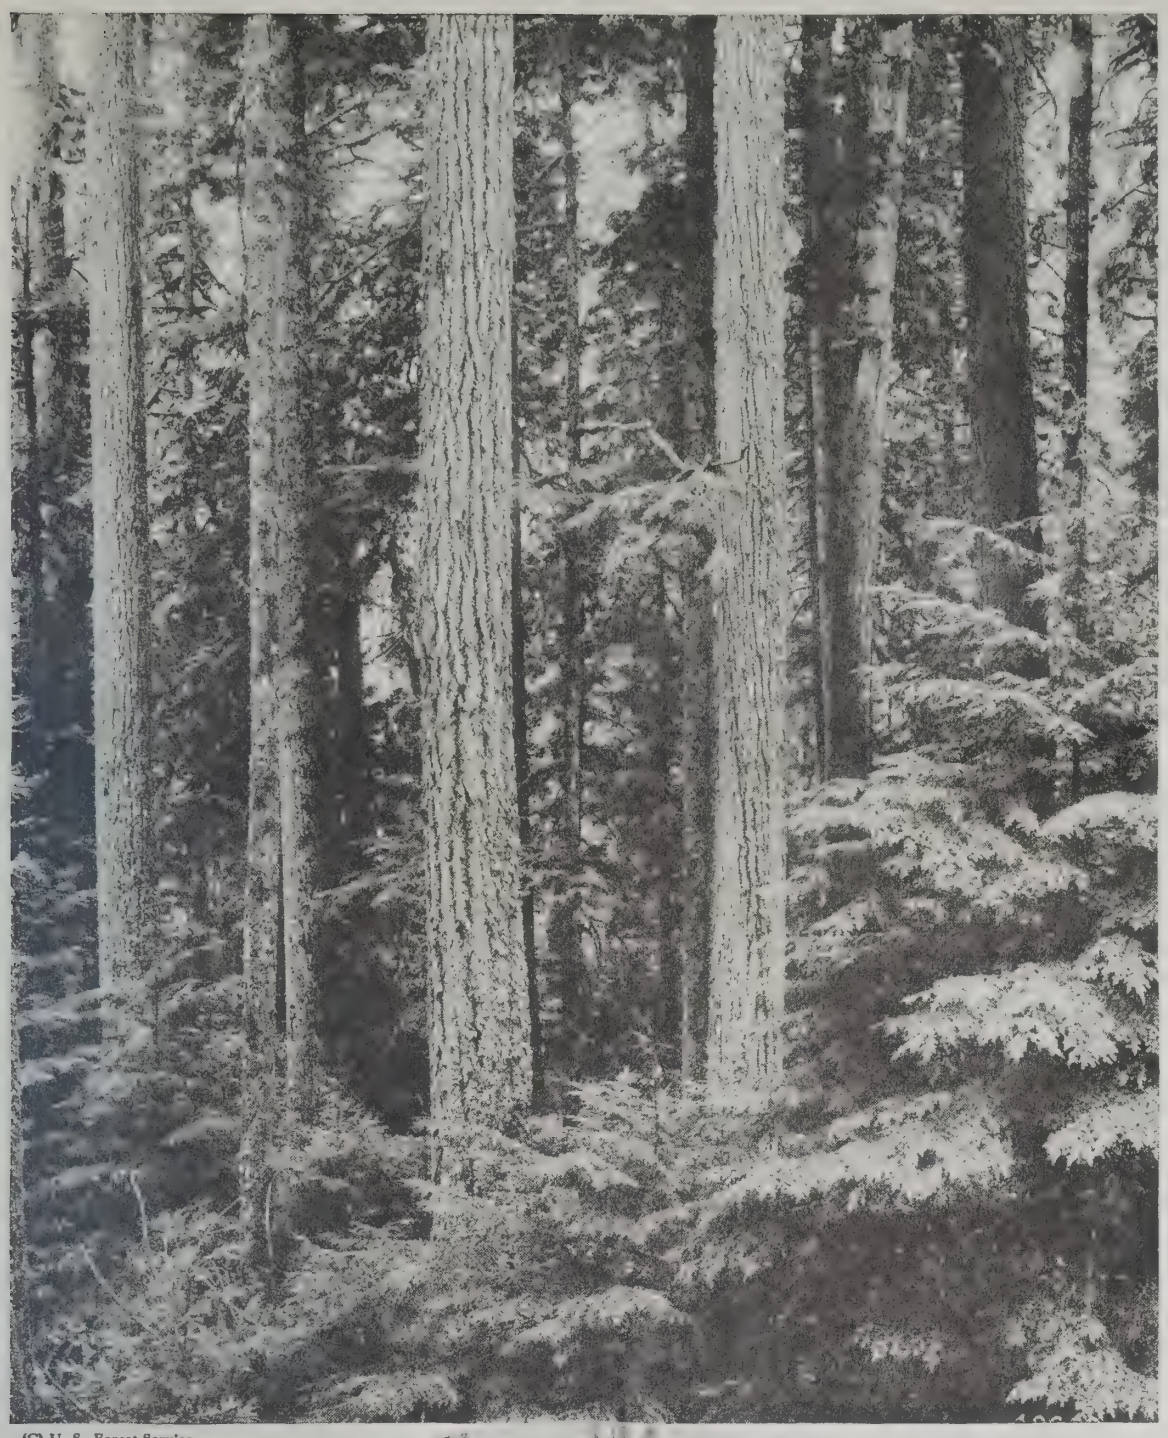
Small battles with the federal forces continued almost every month, without apparent damage to Zapata or his army. General Gonzales, with a force as large as that of Zapata, occupied Cuernavaca, and engaged in numerous raids against the Master Bandit, but all without serious result until the beginning of the winter of 1920, when the wires carried the news out of Mexico City that Emiliano Zapata had been killed. That was all; there were no details and it was not until a few days ago when I met the widow of the Master Bandit in New Orleans, that I learned the dramatic story of the end of the Attila of the South. This widow, Maria Flores de Zapata, following his death, fled Mexico, fearing the vengeance of the then Carranza government, and lived for some time hidden among poor families of Mexicans along the Texas border. When the Obregon government came into power and declared amnesty for all political refugees, she came to New Orleans on her way back to seek her parents and family in the town of Cuautla, whence Zapata took her on one of his raids in 1919. Here is her story putting such an end to the career of the Master Bandit as comports well with every day of his life since he was released from the Mexican Army in 1910:

"In the spring of 1920, General Zapata had come again into control of Cuernavaca, about 75 miles south of Mexico City. He had about 12,000 men, for the country had been well looted and there was little to attract men who had lived by robbery for nearly ten years, so that hundreds of them, informed of the offers of amnesty by the Carranza government, had returned to work in the cities and mines and on farms. General Pablo Gonzales came south from Mexico City with about 10,000 or 12,000 men and General Zapata evacuated Cuernavaca, moving to Jojutla, Peltlalcingo and other villages surrounding Cuernavaca, which latter city General Gonzales occupied. A federal force under the command of Colonel Jesus Guajardo was sent against General Zapata where the latter was encamped in the town of Cuautla, but, instead of attacking this place, Colonel Guajardo sent messages to Zapata asking the latter what inducements he would offer if he (Guajardo) would join him with his entire regiment. Zapata was tricked, and, within ten days, a meeting had been arranged at the little Indian village of Calixto, about 10 miles from Cuautla. General Zapata took only ten men and left his brother, Eufemio Zapata, in command of the forces at Cuautla. A passport for Guajardo and ten men was sent to him through the Zapata lines, but Guajardo altered this passport, so that in reality he took 100 men. Then Guajardo notified General Gonzales in Cuernavaca, and the latter launched a night attack against Cuautla, on the evening of the day on which Guajardo and Zapata were to meet in Calixto.

"I went to Calixto with Zapata, who, true to his promise, took only ten men. Guajardo also appeared with ten men, but he left 90 others concealed in the hills a short distance from the meeting place. The village of Calixto lies in a little bowl in the hills, hidden by heavy forests, and consists of only a few houses and about 100 brush *jacales* (huts) in which the Indians live. The men met beneath a large Ahuehuete tree in the center of the village. I sat on the veranda of the house in which Zapata had his headquarters and saw all that went on there. They talked for about an hour, each seated at a table, with the ten men of his party standing behind him. They had some argument, but it appeared to be friendly, and I thought all was going well, when I heard a shouting on the hill back of the village. Looking up, I saw three Indian boys running down the hill as fast as they could run. As they got about half way down the slope, some men appeared at the crest of the hill and began firing at the boys. Two of the boys fell, and then my attention was attracted by shots down at the place of conference.

"When I looked down at the big tree, Guajardo had leaped to his feet and was attacking Emiliano with his saber. Zapata had no weapons except the large machete* he always wore, having left his rifle and pistols in the house, as had also Guajardo. With this he was defending himself. The ten men on either side were shooting at each other with their pistols, but, being so close to each other, soon were fighting hand to hand with their machetes and using their pistols as clubs. General Zapata's flat machete was not suited for use against a saber, and presently I saw it fly from his hand, either knocked out by a blow from Guajardo's saber or by one from some other machete. He tried to rush in past the flying saber blade and grapple with Guajardo—for Zapata, despite his slenderness, was very strong and a skilled wrestler—but, as he rushed in, Guajardo held out his saber, straight, and pierced my husband through with it, so that his body fell forward and was held up only by his enemy's right arm.

"By this time, the rest of Guajardo's men, who were those I had seen shooting at the boys on the hillside, had come up, and the three or four of my husband's men who remained, were lined up against a wall and shot to pieces. Then, while I watched them, helpless, Guajardo stooped down and cut off my husband's head, holding it up by the hair to show that this thing had been Emiliano Zapata. Thereafter, they carried this trophy to Mexico City, so that the officials and the people might be sure that the man who had ruled nearly all of Southern Mexico for more than ten years, was really dead. I fled into the brush and that night when the federal soldiers had gone, I, with the help of some old men and women among the Indians, dragged my husband's body into the brush and buried it and piled stones over it. Two weeks later, in Mexico City, I saw my husband's head on a pole in front of the military barracks, a dried round ball of bone and skin that once had ruled more than 20,000 men."



**Machete*--a flat-bladed weapon, not unlike the "corn-knife" used for cutting fodder from stacks in the Middle West of the United States. The Mexican uses it for cutting the brush to build his hut, for cooking his meat over the fire, for beating his wife, for spanking his children, and for killing his enemies. It is a weapon capable of slicing a man from poll to thigh, but not heavy enough to meet an army saber in full swing.

One of the Few Gocarts of China

(C) Gilliams Service

This innocent little pug-nosed daughter of China looks out upon the world from her sumptuous gocart, rigged up with stout bamboo sticks. She has a seat when she is tired, and causes little annoyance to her mama, who, until she became affluent, had to carry her babies on her back, like most mothers in China.

BEFORE AND AFTER THE GREAT STORM

Government experts estimate that eight billion feet of timber will rot to waste or, perhaps through carelessness, be the means of causing a terrible forest conflagration in the virgin forest of the Pacific Slope. The scene is pictured in these "before" and "after" photographs. This timber was leveled by a wind that broke the government instruments at 140 miles an hour.

Who Can Solve This Problem?

Government seeks to salvage eight billion feet of timber blown down by record windstorm in Washington.

THE Secretary of Agriculture, the Secretary of War, government forest experts, state officials and lumber dealers are looking for a man who can solve a problem that never before has been brought up.

A short time ago a windstorm came in from the Pacific Ocean and raced across the Olympic Peninsula in the northwest section of Washington. It blew down virgin forests 30 miles in width and 75 miles in length; an area almost as large as Connecticut. It was, by all odds, the worst timber storm ever known. It is estimated that many trees were more than 600 years of age. Experts connected with the United States Forest Service at Washington say that at least eight billion feet of lumber are contained in the trees sent crashing to earth or snarled together in a tangled mess in the great waste left by the storm.

Government officials are perplexed and worried. The swath of dead and dying giants of the forest will soon become so dry that it will constitute the greatest fire trap in the United States. A lighted match or an earthward flash of lightning is likely to cause a conflagration that will make the spurting of an average volcano or the burning of Rome seem like a breakfast fire in comparison. Such a fire not only would destroy this tremendous quantity of timber, but would likewise burn fifteen billion feet of beautiful standing forests to the north and south.

Secretary of War Weeks has sent three airplanes to the scene to take photographs and sketch maps to aid in attempting to solve the situation.

It is impossible for many of us readily to grasp such immense quantities as eight billion feet of lumber. Here are a few figures that will help in grasping the facts:

If these eight billion feet of lumber were sawed to boards an inch in thickness there would be enough to lay a board walk 60 feet wide around the earth at the equator. There would be enough planking to build a tight fence 97 feet high around the United States—across the Canadian border, down the Pacific Coast, across the Mexican border, thence along the Gulf and Atlantic coasts to the far corner of Maine. If some young swain with the restlessness of springtime in his blood had a desire to visit the fair and beautiful maid in the moon the lumber would be sufficient for him to build a walk thence six feet wide.

An Indian, who has been living in the far Northwest for more than 80 years, said the wind against the trees reminded him of a scythe cutting grass in a hayfield. He viewed the storm from a hilltop out of the path of the storm.

It never will be known just exactly how fast the wind blew. The government weather stations at several places were completely wrecked when the wind was registering 140 miles an hour. Shortly thereafter the velocity was greater. Very little rain fell.

Not a single person was killed but many animals lost their lives. That region abounds with elk, deer, bear and smaller animals, and unknown thousands of them were crushed by the trees falling. It is feared that many animals, hemmed in by barricades of uprooted trees, will slowly starve.

The greater part of the timber is hemlock and spruce, both of which are subject to rapid decay. Salvage necessarily is a matter of promptness, if it can be effected at all. The nearest railroad is 35 miles distant.

Only three times before in the history of the United States have windstorms destroyed large quantities of timber. In 1875 a strip of pine timber, 20 by 100 miles, in Eastern Texas, was blown down. In 1900 another storm galloped across Texas blowing down timber over country 30 by 70 miles. This timber is not nearly so large as that in Washington and the footage therefore was small in comparison.

In 1883 a storm swept over several counties in Maine leaving hundreds of millions of feet of timber prostrate. Comparatively little was salvaged.

The man who has the gray matter to show Uncle Sam and other vitally interested parties how to get rid of the fire trap on the Olympic Peninsula, and salvage eight billion feet of lumber, never again will have to worry about the money for next winter's coal.

URBANA ILL

Briefly Told

The Paris Chamber of Commerce will conduct courses in Esperanto in the schools which it controls.

With the recent death of James Jones, aged Negro employe in the Senate office building, the whereabouts of the official seal of the Confederacy, an unsolved mystery for half a century, probably will ever remain unknown. Serving as Jefferson Davis's servant when the Confederate chieftain was captured, Jones buried the seal before the Federal authorities could obtain it.

Forest Service laboratory workers at Madison, Wisconsin, have discovered that kiln-dried timber is fatal to some if not all the wood-boring grubs. This fact is of special importance to users of hickory, ash and certain other woods which are subject to attacks from these insects.

To avert the danger of forest fires caused by sparks from locomotives, the officials of the Kushequa Railroad of Pennsylvania announce that no trains will be run over that road during dry weather. Inhabitants of the danger zone welcome this decision.

A claim to 14,000,000 acres of land in Oklahoma and Texas, including the cities of Oklahoma City and Tulsa, together with practically all of the Burkburnett oil field, was recently filed in the Supreme Court in behalf of the Cherokee Indian Nation.

Greece recently held its first woman suffrage convention. The speakers enlarged on the part that women had played in the history of Greece, ancient and modern, and their right to political suffrage on an equal basis with men.

A submarine torpedo became entangled in the net of a trawler near New London, Connecticut, recently and was brought to the surface with the haul. It is believed to have been lost from the submarine E-1 during maneuvers in Long Island Sound.

For no apparent reason two women of moderate means locked themselves in a suite of three rooms in a Hoboken, New Jersey, hotel and lived there for more than three years. They lived entirely on canned goods ordered by mail. Rent payments were made by checks thrust under the door. The accumulation of empty cans on the fire escape led to investigation by the health authorities.

When oak is buried in water or in wet sand it will last for centuries. Oak piles under bridges constructed by the Romans two thousand years ago have been found to be as sound as when they were first placed in position.

Thieves recently plundered the Weimar museum in Germany, taking Rembrandt's portrait of himself and other pictures by famous Dutch painters, valued at millions of marks.

The Postmaster-General has sent out an order posting a standing reward of $5,000 for "any postal employe or other person who brings in a mail robber."

Officials of the Pennsylvania Railroad have instructed their employes to notify passengers of any serious delays to trains, the cause, probable length of time of interruption and when service will be resumed.

The remains of an imposing temple have been unearthed by Greek archeologists at Renas in Thessaly. The temple is in an excellent state of preservation and is as large as the Temple of Jupiter at Olympia. Inscriptions in bronze establish the date of 400 B. C.

The Wichita National Forest Commission permits no cattle that have not been dehorned to run on the reserve. Cattle with horns hook into the trees and twist and break the tops and branches of the young growth. The cattlemen are pleased to co-operate with the Forest Service in this matter.

A Minden, Nevada, hotel proprietor, unable to open his safe containing valuables belonging to departing guests, wired to the Nevada State Prison for a safe expert. A convicted burglar was sent at once and promptly opened the vault.

A French aviatress was the first woman to fly across the Andes. She recently made the flight from Mendoza, Argentina, to Santiago, Chile, in four hours.

American students in architecture, landscape architecture and engineering will devote their vacation time to repairing the devastated regions of France, under the direction of French officials.

The Montana senate has passed a bill providing for a special tax of $3 annually on all bachelors residing in that state, the proceeds of the tax to be paid into the widows' pension fund.

A life-sized statue of "Devil Anse" Hatfield, carved in Carrara marble and portraying "Anse" standing bareheaded looking out over the mountains of his native state, will be erected on the site of his late home by relatives and friends.

Ancient Pompeians had both primary and general elections, similar to those we have in every town and city each spring. They were in the midst of an exciting local election, it is indicated, when Pompeii was destroyed in 79 A. D.

It is believed that the experimental camphor groves which have been planted in Florida will be developed to commercial importance within a few years.

The Krupps firm of Germany has succeeded in perfecting a process by means of which fuel values can be recovered from cinders. The process utilizes the magnetic property of the iron compounds contained in the cinders. Approxi[illegible] twenty-five per cent of the weight of the c[illegible] recovered.

ITS SEARCHLIGHT CANNOT BE DIMMED!

THE TRUTH, AFTER ALL, IS THE IMPORTANT THING!

The American people are paying tribute to the one magazine in this country which has courage to print the truth—which is unbiased by the powerful interests that exercise such a tremendous influence on the newspapers and periodicals of the United States. Not only are we continuing the discussion which has aroused the entire country to the conditions which have been created by a highly-organized minority, but our plans call for the publication of further truth-telling, informative articles on subjects which for the most part heretofore have been denied the public.

JEW ADMITS BOLSHEVISM!

"Kinertia" Versus Einstein

By ARVID REUTERDAHL
Dean, Department of Engineering and Architecture, The College of St. Thomas, St. Paul, Minnesota

Citations That Raise Delicate Question on Age of Theory of Relativity

THE intellectual world generally moves slowly in the matter of extending recognition to those who have consecrated their lives to the cause of reason. Mendel had been dead many years before the remarkable nature of his work was recognized. When we contrast Mendel's case with that of Einstein we are forced to admit that the German physicist's sensational rise is the most extraordinary in the history of science. Barnum, the king of advertisers, could not have staged a more effective and expeditious advertising campaign. Within the brief period of a few months, Einstein's name became known in every civilized country in the world. The Theory of Relativity afforded cartoonists material for humorous sketches, and the doctor and his doctrine became subjects for mirth and merriment.

After the first volcanic outburst of scientific approval and humorous recognition, rumblings of discontent were heard from Einstein's native land. A group of German scientists, in no uncertain terms, expressed their doubts concerning the precise value and originality of Einstein's theory. There were even those who boldly charged the author with deliberate plagiarism. In England Sir Oliver Lodge and a few other able men cautioned the world against a too hasty acceptance of the new doctrine of relativity. In the United States, however, Einstein's theory met with immediate and complete success. Even at the present time we rarely hear a dissenting voice. This is particularly strange for the reason that in the year 1914 a well-known American journal published a series of articles by an unknown investigator who discussed the very same problem which brought fame to Einstein. We refer to the eleven articles written by the unknown "Kinertia," which appeared in *Harper's Weekly* under the caption "Do Bodies Fall?" If it is true that "Kinertia" actually considered the Einsteinian problem in these essays, then the question of priority is inevitably raised and the unparalleled originality claimed for Einstein's work becomes a debatable matter. Indeed, the presentation of the very facts which raise these questions is the main purpose of this article. Since the matter of priority is involved, the introduction in this article of a brief chronological survey of the work of both Einstein and "Kinertia" is of the utmost importance.

The most significant contributions of Albert Einstein have been published in *Annalen Der Physik*. His papers deal with the Special Theory of Relativity, Theory of the Brownian Movements, Inertia of Energy, the Quantum Law of the Emission and Absorption of Light, Theory of the Specific Heat of Solid Bodies, and the General Theory of Relativity. The year 1905 is considered, by most authorities on Einstein's work, as the birth-year of the Theory of Relativity. Careful search, however, has revealed a paper on this subject which was published in Berlin during the year 1904 in the journal *Sitzungsberichte*. That portion of Einstein's theory which deals with the phenomenon of gravitation is a later development. Einstein first gave his attention to the problem of gravitation in 1911, when he developed the Principle of Equivalence of gravitational and accelerative fields. Other phases of this subject were dealt with in papers which appeared in the years 1912 and 1913. A further elaboration, the joint work of Einstein and Marcel Grossman, appeared in 1914. The theory in its final and complete form was announced in the year 1915.

"Kinertia's" contribution deals principally with the problem of gravitation. The question of priority of "Kinertia" over Einstein consequently involves the phenomenon of gravitation in particular. It must be admitted, however, that "Kinertia" has also considered Einstein's earlier problem which involved the significance of motion in reference to an observer. Einstein distinguishes this earlier problem from his theory of gravitation by the separate designation, "Special Theory of Relativity." A brief historical summary of the work of "Kinertia" is now in order.

Lord Kelvin first aroused "Kinertia's" interest in the problem of gravitation. That was in the year 1866 when "Kinertia" was a student under Lord Kelvin. "Kinertia" even then did not agree with the Newtonian theory of force as presented by Lord Kelvin. Incidentally, we desire to call the reader's attention to the fact that Albert Einstein was born in 1879 in Ulm, Germany, thirteen years later. It is a curious coincidence that both "Kinertia" and Einstein were engineers. During the period of time from 1877 to 1881, "Kinertia" became convinced that *acceleration* was the basic cause of what we generally speak of as "weight." The reader is undoubtedly aware of the fact that *acceleration* plays the fundamental rôle in Einstein's theory of gravitation. "Kinertia" corresponded with Kelvin, Tait, and Niven, of Cambridge, with the hope that he would be able to interest these men in his startling theory. This attempt met with little or no sympathy. Some years later, through an accident, "Kinertia" was unfortunately deprived of his hearing. This misfortune forced him to abandon his engineering profession for a rancher's life in the state of California. This new occupation gave "Kinertia" the requisite leisure to complete his investigations which resulted in confirming his supposition that *acceleration* was the great norm of the phenomenon of gravitation. His attempts, dating from the year 1899, to persuade our stubborn American scientists that the Newtonian theory of gravitation must be revised met with nothing but ridicule or indifference. To *Harper's Weekly* and its managing editor (1914), Mr. H. D. Wheeler, belongs the credit of having published "Kinertia's" series of articles entitled, "Do Bodies Fall?" The first article appeared in the issue of August 29, 1914, Vol. 59. The final article is dated November 7, 1914. From the preceding it is evident that "Kinertia" derived his norm of gravitation before Einstein was born. The question of priority is therefore definitely and irrefutably established in favor of "Kinertia" in the case of the General Theory of Relativity considered as a discussion of the problem of gravitation and acceleration.

We turn our attention now to the content of these two gravitational theories. We propose, by means of direct quotations from the works of these two men, to set forth their remarkable similarity. In the case of Einstein we shall quote from his recent book, "Relativity" (Henry Holt and Company, 1920), and in "Kinertia's" case our quotations will be from the *Harper's Weekly* articles.

The following comparative quotations show the striking similarity existing between Einstein and "Kinertia" when they consider the relation between acceleration and gravitation, a similarity which extends not only to intent but affects even the very words.

Einstein.

"We imagine a large portion of empty space, so far removed from stars and other appreciable masses that we have before us approximately the conditions required by the fundamental law of Galilei.—As reference-body let us imagine a spacious chest resembling a room with an observer inside who is equipped with apparatus. Gravitation naturally does not exist for this observer. He must fasten himself with strings to the floor, otherwise the slightest impact against the floor will cause him to rise slowly toward the ceiling of the room.

"To the middle of the lid of the chest is fixed externally a hook with rope attached, and now a 'being' (what kind of a being is immaterial to us) begins pulling at this with a constant force. The chest together with the observer then begin to move 'upwards' with a uniformly accelerated motion. In course of time their velocity will reach unheard-of values—provided that we are viewing all this from another reference-body which is not being pulled with a rope.

"But how does the man in the chest regard the process? The acceleration of the chest will be transmitted to him by the reaction of the floor of the chest. He must therefore take up this pressure by means of his legs if he does not wish to be laid out full length on the floor. He is then standing in the chest in exactly the same way as anyone stands in a room of a house on our earth. If he release a body which he previously had in his hand, the acceleration of the chest will no longer be transmitted to this body, and for this reason the body will approach the floor of the chest with an accelerated motion. The observer will further convince himself *that the acceleration of the body toward the floor of the chest is always of the same magnitude, whatever kind of body he may happen to use for the experiment.*"—(*"Relativity,"* pages 78 and 79.)

"Kinertia."

"I set to work to find out by experiment whether bodies actually did fall with the acceleration which the force of attraction was said to produce. Years before that, when in England, where some of our coal mines had vertical shafts about 1,500 feet deep, I had studied the cause of weight by having the hoisting engine drop me down with the full acceleration for about 500 feet. Then, by retardation during the lowest 500 feet, I could experience increase of weight all over me so marked that my legs could hardly support me. That taught me that acceleration was the proximate cause of weight, but at the time of these experiments I still thought the acceleration of the falling cage was really caused by the earth's attraction."—("Do Bodies Fall?" *Harper's Weekly,* August 29, 1914, page 210). "Weight is not a kinetic force because it cannot produce acceleration. *If a body were accelerated in proportion to its weight, then weight would be a force.*"—("Do Bodies Fall?" *Harper's Weekly,* October 17, 1914, page 383).

It is noteworthy that the only real difference between these two citations is that Einstein derives his conclusions from an hypothetical case, whereas "Kinertia" draws his conclusions from an actual experiment upon himself.

The interpreters of Einstein furnish us with further corroborative material which we submit as additional evidence in the case of "Kinertia" versus Einstein. Professor A. S. Eddington's interpretation of Einstein's theory is authoritative. The following quotations are from his work, "Space, Time and Gravitation" (Cambridge University Press, 1920). These quotations from Eddington's work also consider the equivalence of acceleration and gravitation.

Eddington.

"The nature of gravitation has seemed very mysterious, yet it is a remarkable fact that in a limited region it is possible to create an artificial field of force which imitates a natural gravitational field so exactly that, so far as experiments have yet gone, no one can tell the difference. Those who seek for an explanation of gravitation naturally aim to find a model which will reproduce its effects; *but no one before Einstein seems to have thought of finding the clue in these artificial fields, familiar as they are.*

"When a lift starts to move upward the occupants feel a characteristic sensation, which is actually identical with a sensation of increased weight.—In fact, the upward acceleration of the lift is in its mechanical effects exactly similar to an additional gravitational field superimposed on that normally present."—("Space, Time and Gravitation," page 64.)

On the eminent authority of Eddington we may therefore state with absolute certainty that Einstein found his clue to the nature of gravitation in the *artificial field* created by acceleration. Eddington's statement, however, that Einstein was the first scientist to think of this *clue* is evidently erroneous in view of the preceding quotations from the work of "Kinertia."

The remarkable similarity in thought of the following quotations pertaining to the relative effects produced by accelerated and uniform motion, is of high evidential interest.

Eddington.

"The observer in the accelerated lift travels upward in a straight line, say 1 foot in the first second, 4 feet in two seconds, 9 feet in three seconds, and so on. If we plot these points as x and t on a diagram we obtain a curved track. Presently the speed of the lift becomes uniform and the track in the diagram becomes straight. So long as the track is curved (accelerated motion) a field of force is perceived; it disappears when the track becomes straight (uniform motion)."—("Space, Time and Gravitation," page 66.)

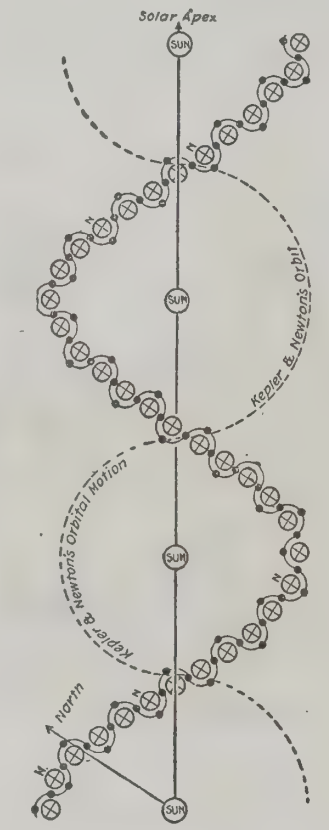
"Kinertia."

"The proof that matter can exist without weight depends on the first law of motion; because if a mass moves uniformly in a straight line in space, it cannot have weight. If weight is caused by the mutual attraction of matter, then a mass subject to attraction must move in a curve. If weight is caused by acceleration then it cannot follow Newton's law and move with uniform velocity in a straight line."—("Do Bodies Fall?" *Harper's Weekly,* October 10, 1914, page 350.)

The conclusions of Einstein and "Kinertia" concerning the very existence of the force of gravitational attraction are identical in content. This is apparent from the following citations from an article by Professor Edwin B. Wilson, (Massachusetts Institute of Technology) and "Kinertia's" basic articles.

Wilson.

"But just suppose that somebody tells us that the force of gravity is physically non-existing quite as much as the centrifugal or Coriolis force, and that the reason we think that gravity is real is essentially the same that leads the untutored mind to believe there is a physical force acting to move objects to one side when a train goes around a curve—namely, an unhappily ignorant view of Nature. This is what Einstein asserts."—("Space, Time and Gravitation," the *Scientific Monthly,* March, 1920, page 226.)



"Kinertia."

"But now, since it can be proved that there is no such force in the universe as attraction and that the supposed fall of bodies toward the earth *by that force* is only an illusion of the senses, there will be new ground upon which theologians can meet the Laplace attractionists, and Haeckel and his materialists."—("Do Bodies Fall?" *Harper's Weekly,* September 19, 1914, page 285.)

The preceding citations are sufficient to establish conclusively the fact that, in underlying essence, "Kinertia's" theory of gravitation is identical with Einstein's. Both men find the crux of the problem in acceleration, and the development of both theories is based upon the very same experiment.

(Concluded on page 14)

By KINERTIA

Kinertia's kinetic theory of the planetary motions in space. A kinetic illustration, qualitative only, of the Earth and Moon's corkscrew path in space. This is the theory which Kinertia declares he is prepared to establish as soon as the scientific world will acknowledge that the apparent fall of bodies is an illusion of the senses.

Reproduced from the cut as it first appeared in *Harper's Weekly*.

Our "Acres of Diamonds"

By AARON HARDY ULM]

A government scientist finding what minerals of value lie hidden in these remote mountains.

THOSE who have heard of Dr. Russell H. Conwell's lecture, "Acres of Diamonds," will recall his citations of dramatic instances of persons' going far afield for treasure which they could have found by merely staying at home and looking around them. There was the Thracian peasant who sold his little farm and sought diamonds in foreign lands. Later the greatest of ancient diamond mines was found on the farm he sold. There was the Pennsylvania oil prospector on whose boyhood home, after the prospector sold it, was discovered one of the biggest oil strikes in history; the mineralogist who worked for others on salary most of his life although as a boy and young man he had unknowingly walked daily over rich deposits of silver.

The mistake each made was probably in throwing the glamour of romance and distance over Nature's buried treasures; it is a mistake most people make. When I speak the word "diamond," or "ruby" or "gold," or even "silver," I command your attention; your mental inhibitions give way and your mind becomes receptive. This is because for ages mineral wealth was visioned in terms of the so-called precious metals or stones. When I mention coal and iron and bauxite or manganese, your impulse is to turn a page and look for something interesting. Yet coal and iron and bauxite and manganese, not to mention a score of other minerals, are much more useful than diamonds, gold or silver, or all the so-called precious metals put together. More money has been made from these "base" metals, more in future will be made from them, and more actual romance is associated with them.

Food supplies cached by geologists in uninhabited country.

Nature seems to have assumed that North America, and especially that part known as the territory of the United States, would be inhabited by a people of exceptional common sense. For Nature gave to this part of the world an undue proportion of mineral wealth and withheld from it, in large measure, those types of mineral wealth that are more ornamental than practicable. We have had, and it may be we still have, a large supply of gold, but as compared with supplies in other regions of the earth ours are not exceptional. We also have a large amount of silver. There our precious mineral resources almost end. Diamonds and rubies have been found in the United States, domestic diamond mines have been operated for a long time, but our supply of precious stones is very small. We have a little, very little, platinum and other super-precious metals. And there is very little hope that we will ever find in the United States any large deposits of "gew-gaw" minerals.

But of those minerals that really add to the comforts and the physical satisfactions of life we have, with few exceptions, supplies whose volumes stagger the imagination. And when we add to them other resources of the earth's interior, like water, or of the earth's surface, like water power, we have a total of stored wealth that makes even the cost of the World War look Lilliputian.

For more than forty years a definite program for cataloguing this immense national wealth has been under way. It is carried on by the United States Geological Survey, assisted by like but much smaller organizations maintained by many of the states and by some of the universities and scientific institutions. Despite all that has been done by government agencies and others, the cataloguing is yet far from complete, and general knowledge of what has been done is very small.

If you found a high school pupil in ignorance of the general location of an important American river, you would feel like lambasting our system of education. Yet it is doubtful if you would find more than a small percentage of high school teachers, or even college professors, familiar with what has been disclosed about underground streams in these United States. Yet those very streams are attaining a practical significance comparable to that of those above ground.

The managers of a certain southern university decided a year or two ago to sink an artesian well on the campus. The drills went down and down and down and no water came. Then somebody thought of writing to the Geological Survey.

"If you move your operations westward about 300 yards," a Survey specialist wrote back, "you will get water quickly."

The advice was followed and water obtained.

The specialist was able to direct them accurately for the reason that in great part the subterranean waters of the country have been mapped almost as completely as the surface waters, but the professors at the school in question knew nothing of a stream they walked over every day.

Why should the average person's brain be tortured with prosaic information about subterranean waters?

In the first place it is not prosaic, it is information freighted with Arabian Nights and Jules Verne possibilities.

And for second place let me propose an item of ignorance that perhaps not one in a million can disclaim—the writer couldn't have done so before he had dug through a lot of government pamphlets. The item has to do with the value of water as a mineral resource.

"Bah!" says the scoffer.

Well, water, just ordinary water, says the Geological Survey, is the most valuable mineral resource we possess. Its value exceeds that of coal, of which there is several thousand years' supply, or of iron, of which the store is about twice that of coal, or seven and a half billion tons; all this in the upper crust of these United States. And this relates only to the subterranean and surface water, such as is used for irrigation, power or drinking purposes. Subterranean water has made vast areas of arid country to blossom like the rose, has rendered many miasmatic areas healthful and supplies power on an extensive scale. If our subterranean and our surface streams were utilized to the fullest extent, there would be an addition to the nation's wealth so vast that the figures would be bewildering. Of our surface water power a negligible portion only yet has been put to economic use.

No sensible person would think of choosing a business location or a habitat without giving further thought to the equation of water. But we do not give as much thought as we should to the matter. May this not be due to the fact that things "geological" are not regarded as things germane? Geology covers things so intimate that we never are away from them, so inclusive that every one must be something of a geologist, and so far-reaching that geology comprises virtually our only safe guide to the past and our only accurate light on the future.

So important to modern life have geological matters become that it is not extravagant to suggest, the person preparing for a business career, especially for manufacturing, should begin by mastering its important and pertinent phases. For the fundamentals of most producing and many distributing ventures depend ultimately on geology. Power is perhaps the most potent equation in modern industrial life. And power is now very largely in the geologic field. Coal, petroleum, water are the chief sources of industrial power, and you can act safely with reference to none of these unless you consider geology.

Getting the lay of the land from a high mountain point.

Failure in the past so to consider power caused the industries of the country to develop in large part contrariwise to the geography of nature; so much so that, in the words of Dr. George Otis Smith, director of the Geological Survey, one of every five tons of coal shipped goes nowhere. It is wasted in the process of linking power with industry. It has now been found, through an extensive study of the subject, that, by the mere pooling of the power resources in the industrial region 150 miles from the seaboard between Boston and Washington, some 25,000,000 tons of coal would be saved annually. And the chief saving would be in transportation, for one-fifth of railroad freight now comprises coal alone, all because thought of fundamental geology figured so little in the development of industry.

But mineral raw material is perhaps more important than power. We now mine about one hundred minerals that are used as such material. And somewhere in the country we have ample supplies of almost all that are of consequence. We are short on tin and on available potash, and we have no nitrates; lacking also several of the lesser consequential metals. But no other country in the world has such variety or volume of most of the metals that enter into industry.

There are few businesses in which the source, supply and character of minerals used in industries don't have controlling importance. Thus the wise man going into business will investigate geologically with reference to more things than current supplies. He will become acquainted with fundamental geology as set forth in the publications issued by the Geological Survey and like organizations.

Those publications cover a wide field, giving the results of researches in all parts of the country by specialists of various orders.

Today members of the survey's force of nearly 1,000 are studying fossils in Nebraska or Georgia, perhaps, and from them unraveling the records of millions of years in earth's wonderful life story. Fossils are the geologist's clock. From them he tells time and is able to diagnose the mineral content of the earth's crust in different areas.

Other geological survey men are making studies of specific mineral deposits in different sections, so that engineers and prospectors may have data to guide them in opening up new supplies of mineral wealth.

One of the biggest jobs of the Survey is that of making topographic maps for all the country. Data for these maps must be gathered from detailed surveys over every inch of area covered. The maps show the altitude of every spot included and usually all other features such as houses, roads and streams. Those maps are sold at 10 cents each, about the cost of the paper and printing, and you may be surprised to learn that more than one-half million copies are sold every year. In fact, the Geological Survey conducts the biggest map-making establishment in the world.

Geologists lead adventurous lives, for they often go where no one has gone before. They have done the most exploring in Alaska of all the men who have written about life in the Far North.

One of the most adventurous tasks ever put up to the survey is that of mapping the territory and cataloguing the mineral resources of Alaska. One of the first items of that task was the exploration of Mt. McKinley, the highest mountain in North America. Survey men were the first white persons to penetrate into the remoter parts of Northern Alaska. They have produced many volumes dealing with the Great North, but there

America's Avid Appetites

A VIGOROUSLY pressed assault on American Sunday observance which is now under way in the press and in the motion picture theaters makes industrious use of the term "Blue Laws." Every device of the satirical writer and the comic cartoonist has been utilized to create a condition of mob hysteria on the subject. There are assumedly intelligent people who will tell you that a strong organization of fanatical and puritanical reformers are determined on imposing "their seventeenth century notions" on the modern people of free America.

Under the threatened enactment by Congress of these "blue laws," we are told everybody will be compelled to go to church on Sunday on penalty of fine and imprisonment. Automobiling is to be banned. Pleasant country walks and the innocent recreations in the green places of our city parks, or trips to the woods and the seashore, are to be forbidden. No more Sunday newspapers or comforting after-dinner pipe or cigar! First thing we know a man's kissing his wife on Sunday will become a punishable offense! This is the sort of preposterous guff ladled out to the public in the movie films and the newspapers without measure.

Discrimination is almost as rare as a white blackbird. The very blackness of the smoke-screen barrage sent up in this publicity stunt should have made it suspect in the minds of intelligent people. And a little honest inquiry shows that the whole attack is based from first to last on mendacity. So outrageously audacious, indeed, is this mendacity that it is an insult to public intelligence to assume that any thinking man would be fooled by it. Apparently the anti-rest-day propagandists count on lack of exactly such intelligence.

What are the facts? Simply that certain commercial associations in the United States, with utter disregard for everything but their own pockets, have set out to destroy the American Sabbath to capture an extra day in the week for vampire films and prize fights, incidentally seeking to discredit all laws against bootleggers and gamblers and indecent exhibitions.

As a smoke-screen for their actual objects, these Avid Appetites obtained wide publicity for the statement that a "National Sunday Law," designed to restore the Puritan "blue laws" in all their archaic asceticism, was pending in Congress and was backed by various reform organizations.

The fact is that the only law concerning Sunday observance before Congress is a bill designed to bring the city of Washington into line with 47 of our states to protect the American Sabbath against invasion by commercialized amusements in the national capital. It is a local measure backed by local interests and has been pending for 42 years. It has only local scope and has no national significance. Reform organizations of national scope promised to support it on general principles. But it is not denial but protection of every man's right to Sunday rest that is the aim of these reformers.

Every commonwealth in the Union, except California and the District of Columbia, have Sunday laws which have been revised or affirmed since the Civil War. The only actual Sunday issue is as to whether or not these laws should be enforced; whether the selfish interests opposed to them should be allowed to promote law-breaking. Lovers of their country are called on to bar the efforts of venal interests to obtain exemptions in these laws that would permit money-making exhibitions, including prize fights, liquor selling, gambling and unnecessary business on Sunday. In many states Sunday movies are already illegal, as are other forms of money-making on the Sabbath. They have no more right than any other business to infringe on the weekly rest day guaranteed to the people by their own laws. In fact the claim of the movie men to special treatment is made the more insolent by the fact that it has been publicly admitted recently by officers of a dozen leading motion picture producing companies that many of their films are unfit for public exhibition on any day.

The phrase which has been made to do duty in bamboozling the American public originated in the title of a literary hoax perpetrated by an exiled traitor to the American cause during the Revolution. "The Connecticut Blue Laws" were invented by him and published in London to satirize and belittle the character of the patriots battling for American independence. The "invention" of the "National Sunday Law" of 1920 fittingly rests on the earlier "invention" of 1777. Propaganda is the mother of "many inventions."

This attack on the American Sabbath by foreigners enjoying our hospitality is palpably un-American. It is, moreover, an attempt to mock and deride the laws of the land and the sound principles of American jurisprudence, as enunciated in a decision of the United States Supreme Court. That tribunal in 1886 distinctly declared:

> "Laws setting aside Sunday as a day of rest are upheld, not from any right of the government to legislate for the promotion of religious observances, but from its right to protect all people from the physical and moral debasement which comes from uninterrupted labor. Such laws have always been deemed beneficent and merciful laws, especially to the poor and dependent, to the laborers in our factories and workshops and in the heated rooms of our cities; and their validity has been sustained by the highest courts of the states."

No true American has any community of interest with the un-American interests now seeking to fool the people of this country by promoted falsehoods. That they may profiteer, they are attacking an eminently American institution, an institution which Theodore Roosevelt rightly said is "essential to mankind and demanded by civilization."

A Prince's Pleasures

THERE is something immensely suggestive in the opinions expressed by Albert, Prince of Monaco, on his recent arrival in New York. He has come to America, he says, to have some fun. When the American or British pleasure seeker wishes to go the limit in the line of what is called "the gay life," he hies him to Monaco. To the natural beauty of this most charming of Europe's garden spots, the art of the architect and the landscape gardener has been made to contribute by recklessly lavish expenditure. Its situation on the Mediterranean with its meeting of sea and mountain gives the place an atmosphere as exhilarating as champagne. It is a city perpetually en fete. A haven of delight to the sensuous, Monaco is forever gay and joyous with flowers, music and all the brilliant-colored pageantry of fashion's dress parade.

And the very core of this Principality of Pleasure is the magnificent temple at Monte Carlo in which devotees of the Goddess Chance gather from the ends of the earth to know the thrills of alternate elation and despair at the gambling table.

But the reigning sovereign of Monaco, lord of all its gardens and pleasure palaces, seeks his amusements elsewhere and otherwise. He is the world's foremost authority in oceanography. He comes to us now to deliver an address on his oceanic researches before the National Academy of Sciences at Washington. Then he will receive the Agassiz medal from Harvard and tour the country telling our learned bodies and students of his discoveries concerning the depths and the currents of the seven seas. He is also an authority in paleontology and will expound to us interesting things he has discovered about fossil organisms. Although 71 years old, he rises at six every morning to devote himself to laborious research and study and retires late, "even so finding the days all too short to accomplish all he wishes to accomplish."

This is his idea of fun, and he seems to thrive on it. He also enjoys music and the theater in moderation. The entire revenue of his principality is derived from the rental paid by the concessionaire of the gambling casino. It enables him to relieve his subjects from all taxation and to provide on a liberal scale for their welfare and enjoyment. The gambler pays all the bills. Well, it takes all sorts of people to make a world and this world is certainly one of queer contrasts and contradictions.

"Double Jointed"

"ANOTHER Dreyfus case," shouts Senator Calder in connection with his demand that the Department of Justice institute a special inquiry into the facts in the case of Captain Robert Rosenbluth, formerly of the Engineers, accused of the murder of his superior officer, Major Cronkhite, at Camp Lewis, near Tacoma, in 1918.

In this gratuitous attempt to link the name of Rosenbluth with that of Dreyfus, the New York Senator is evincing suspicious subserviency to the Kehillah and a marked susceptibility to the influence of the strongly Jewish constituency of his home district in the Borough of Brooklyn.

It will be recalled that—thanks largely to the eloquent and forceful advocacy of a Gentile, Emile Zola—the innocence of Captain Dreyfus, a Jewish officer in the French Army, was vindicated and his restoration to freedom and rank obtained some time after he had been convicted of the treasonable communication of French military plans to Germany.

At the time, and ever since, the Jews have exerted themselves to make capital of the case. It has been depicted at frequently recurring intervals for a generation past as typical of the "wrongs inflicted on the Jewish race" through the alleged prevalence among Christians of "anti-Semitic" hatred. Let it be said for Dreyfus himself that he was a very decent fellow, averse to posing as a martyr to racial prejudice and probably greatly annoyed by the constant and continuing exploitation of his sufferings on the part of his co-racials. It seems likely that he well understood that he was the victim not so much of racial antipathy, as of that arrant French militarism exemplified in the person of one of his accusers on the second trial, an officer who declared on the witness stand that he would instantly shoot his own mother if so ordered by his commanding officer. And possibly Dreyfus more than suspected that there was close connection between the military clique and the financial clique in control of the French Government. It is certain that very powerful influences in French Jewry might well have exerted themselves more effectively in his behalf *before* he was doomed to Devil's Island and its inferno.

The endeavor to make a "Dreyfus" of Rosenbluth is decidedly suspicious. It is an appeal to passions and blind prejudices that should have no least part in the public consideration of the question of the accused man's guilt or innocence. That should be left confidently to the orderly processes of the law of the land. An attempt to paint Rosenbluth as a martyr to race feeling at this time can have no other object than deliberately and malignantly to manufacture in this country just such an "anti-Semitic movement" as is utterly alien to every American tradition and sentiment.

At the time of Major Cronkhite's death, of which Captain Rosenbluth and Sergeant Roland P. Pothier were the only witnesses, it was generally accepted that he had killed himself either deliberately or accidentally. The three men were on a hike in the woods near Tacoma. At the inquest, Captain Rosenbluth testified that the major had been shooting at a target with his revolver and was holding the weapon negligently near his head as if to bring it down for another shot when it was discharged. Cronkhite was "double-jointed at the wrist," Rosenbluth now explains, "and the muzzle of the gun being pointed downward, accounts for the entrance of the bullet at the base of the neck."

Some doubt seems to have arisen as to the possibility of the wound having been self-inflicted and an investigation was quietly pursued. Recently Pothier was arrested and is alleged to have made a confession implicating Rosenbluth. Both are at liberty on heavy bail pending trial. *The present attempt to take the case out of court and try it in the newspapers and in Federal "investigations" may not be without significance.*

Whisky Not a Medicine

THE recent declaration of the National Medical Association that whisky has no therapeutic value finds strong support in the fact, brought to light through a recent canvass of the 152,627 physicians in the United States, that only 33,379 or 22 per cent of their number hold permits to prescribe whisky for medicinal purposes.

In 24 states, druggists cannot fill such prescriptions and physicians are not allowed to prescribe alcoholic liquors as medicine. There are 40,000 physicians in these states, and in many of them pure grain or ethyl alcohol is found to be a satisfactory substitute for whisky or brandy as a solvent or preservative.

All of which would indicate that there is nothing very drastic in the Volstead Act's limitation of the physician's right to prescribe whisky for medicinal purposes to not more than one pint for one patient in any ten days.

Mr. Ford's Page

THE immigration question has come to the front again and gives another illustration of the difficulty of deciding national policies with rigid mathematical precision. The fact that this question occurs is proof that something is wrong; the fact that no offered solution can be considered as final is proof that we have not yet found the principle that should govern us.

Two points are fixed, of which it will be very hard to dispose. One is our national tradition as a place of refuge for all people. It will be impossible to cause the people of the United States to turn their faces like flint against the populations of the Old World who wish to come to us. We have stood before the world as the open door for all who would begin their lives again in a condition of liberty; we have never refused sanctuary to the person fleeing from persecution.

The other point has already been made: our national attitude is the first; the plight of the alien is the second; they merge together. To close our doors is not a national act alone, it reacts upon human beings elsewhere. And that we shall ever be loath to do.

That is to say, perhaps, that we are incurable sentimentalists on this question. We may admit this, even while we keep a shrewd eye on those who diligently play upon our sentimentality for their own purposes.

We may admit most of what the spokesmen tell us, too—the spokesmen who are more interested in other races than they are in America. We may admit, for instance, that this country was made by immigrants. So it was. The pioneers were immigrants. They came to a wilderness and made it blossom. They came to a bleak and stormy coast and filled it with commerce. It is impossible to honor them too much.

We ought to be frank enough, however, to see that not all modern immigrants are of pioneer quality. It is one thing to come to a country to help make it, and quite another thing to come to a country as to a ripe tree to pick it. *There was no immigration problem in the United States so long as immigrants came to help make the country.* The country knew its friends, felt the impulse of new life with every shipload of those who came seeking a place to bestow their best. But as soon as the type of immigration changed to include people who came to pluck the country of its good things, immediately the body of the nation felt its vitality decreasing, as with some slow insidious disease, and presently we knew that we had an immigration problem.

The pioneers came on their own initiative. A very large proportion of those who come now, are brought; they are transported as literally as an army is; they do not form that surging forward of the free and independent portions of other peoples which characterized our former immigration tidal waves. No country can have too much of the pioneer spirit, too much of that loyalty which contributes to the upbuilding of its institutions.

But what have we been getting in this country, particularly of late? What have we been importing besides immigrants? The immigration of destructive ideas has been enormous, too. It is easier to deal with immigrants, in whatever condition of physical, mental or financial decrepitude they may come to us, than with the false ideas which so many of them bring. That is one of the conditions that make the immigration question: we are importing something else besides people and the danger of disease; we are importing dangerous and false ideas—dangerous because false.

Now, America is on the right road, or she is on the wrong road The United States stands for personal liberty within the limits prescribed by the public good, and for equality before the law, or it does not. Our Constitution is the charter of a proper kind of national life, or it is not. We must take one side or the other on these matters, and we must classify men according to the side they choose. If they are of the opinion that the United States ought to be changed into something else, let them be so classified. They, however, cannot be considered as citizens contributing to the upbuilding of this country. If there is a class of people who come to us saying, "We are the apostles of a new era; your way of doing things is wrong; your whole system must be changed," we are entitled to say in reply, "That many of our ways are imperfect, we have long known; we are trying to perfect them; tell us how it is that a light has shone on you with reference to American problems that has never shone on us; show us what you have behind you in achievement and then we shall consider your fitness to become our rulers."

And, for the most part, we find that these people have no constructive record at all, and have nothing within or upon them that recommends them to us as the friends of the American spirit. They may propagate the idea that Americans think them dangerous only because they are dangerous to certain practices by which some Americans practice; they are wrong; we think them dangerous because they run contrary to the spirit of America.

THE immigration question is not one of numbers but of nature; of quality instead of quantity. Here is room enough for all of the right kind; here is no room whatever for one of the wrong kind. So long as pioneer spirits came to this country to help build it up, there was no immigration problem. But as soon as the parasites and malcontents began to swarm here, the problem arose at once. Two principles will go far to solve it: First, selection; second, distribution. We must select those who are capable of becoming Americans; we must say to them, "You shall not settle in the slums of any city, but go into the great open spaces of the country."

The immigration problem is not only a question of numbers. The country is not in danger of being over-populated. There are still great areas of land waiting for people. It is not the number of the newcomers that constitutes the problem, but their unwillingness to begin as pioneers, with the land, and their unwillingness to become American in the American sense.

This, of course, is due to several causes. And before the immigration question can be tackled satisfactorily, a number of things must be done.

The custom of hawking about Europe for immigrants who have least to leave should be prohibited. We are getting now those classes which their home governments are gladdest to get rid of. Indeed, their home governments are so glad to be rid of them that they facilitate their progress hither.

The custom of certain societies in the United States of assisting thousands of immigrants to evade the law by providing them with the amount of money required should be stopped. The same fold of bills brings any number of immigrants into the country, thus destroying the virtue of the law which makes possession of a certain sum an indication of certain desirable qualities.

The custom of immigrants settling in the cities should be so regulated as practically to be stopped. What immigration is doing for us now is simply extending the slums of our large cities until they threaten to taint every part of every community. The United States should assume the right which other governments have assumed and say to the immigrants, "You may go here and settle where you will, but you may not go there." President Taft once said he wished that Russian Jew immigrants would go elsewhere than to the cities. "The more we spread them out in the West the better I like it," he said. "I have tried to help it along so we could help them directly on to the plains of Texas."

This custom of city settlement is encouraged, it is believed, merely to give power to racial rulers which set themselves up in every large city. Settled on the land, the immigrant would more readily imbibe American ideas and would be less amenable to the leaders' plans, and thus a leadership built upon so-called "racial solidarity," but really upon ignorance of American ways, would fall. This type of leadership is a very grave danger in this country, and it is the cause of some very disquieting manifestations in our national life.

More stringent rules of citizenship should be made. The immigrant should be more stringently required to look forward toward citizenship as an important part of his career, and the standard of the requirements of citizenship should be much higher and more strictly applied. It should not be more difficult to acquire membership in a lodge than it is to acquire membership in the citizenship of the United States of America. We have been far too negligent.

Government Helplessness in Foreign Trade

Study of a Problem That Has Had Too Many Conferences

By A. R. PINCI

THE first month of the Harding Administration has been chiefly devoted to our problem of what is commonly termed foreign trade, a trite name that has no appeal for the millions of wage-earners whose welfare depends upon it, and a trend of commercial enterprise to which American business men have hitherto devoted themselves by routine or irresistible force.

Before the war our foreign trade consisted chiefly of what foreigners wanted to buy of us at their own terms—not of what we wanted to or could sell—and at the same time we bought about everything that our customers overseas tempted us to buy. During the last year most of our foreign trade has been the final spurt of its mid-war momentum, with every indication that low tide is in sight.

The government has proceeded to deal with the subject, but at best only in a theoretical sense. Conferences have been held and more are due, but foreign trade has suffered from too many conferences and too little action. There is something that divides governmental ambition in international commerce from the average business man's attitude toward it. With the exception of a few pioneers who are going ahead privately as they have been doing for years and years, the average business man is most unbusinesslike in matters of foreign trade. He likes to talk about it, and this facile discussion is responsible for the wonderful pictures that are being painted about the supremacy of the United States in the world's commerce. Meanwhile by actual operation he retards it and even refuses it. A pioneer in everything else, the American industrialist is afraid of every foreign shadow.

Going Abroad to "Study Conditions"

THIS does not imply that, in the quest for new markets or retention of slipping ones, ordinary business safeguards should be ignored or set aside, or that eagerness for huge profits should blind our exporters and financiers to unstable or unsatisfactory conditions in any given territory. Yet commercial history of the United States proves that during the past century American producers have taken chances without at all yielding their circumspection.

Now, somehow, they have become panic stricken. This fear is the more serious because intangible. One cannot chat with any financier or exporter, as I have been frequently doing, without realizing that no two reasons or excuses for holding aloof are in accord. They seem to wait for something to happen; what, they themselves do not know. They indulge in verbose conferences. Easily one-half of all the business men's meetings held last year were about American trade abroad, and the first three months of 1921 raise the ratio. Every steamer sailing for a foreign port has one or more Americans who are going abroad to "study conditions." They map out ridiculous programs, involving visits to five or six nations, sometimes even ten, accomplish their trip in two or three months, and upon their return grant interviews or statements of balderdash, nothing that adds to the constructive literature of commercial America.

Refuge is always had in such platitudes as learning the languages, proper packing, sufficient prepayment of postage, carefully selected representatives, wonderful opportunities for trade in the future, and there it ends.

It is not so many years ago that Americans used to joke about the Englishman who was invited to make a series of visits in this country, and who, arriving Thursday in New York, hoped to be in Los Angeles Friday afternoon to attend a house party. Today the game is reversed. American business men "do" several foreign nations in tours of investigation—many of them poor investigators at that—which shame any traveling record by the most hurried tourists of antemartial days.

It is perhaps well to state something that has been overlooked by many of the corporations that have sent these representatives abroad, and that is the bad impression caused abroad. To begin with, announcement is made that the voyage is for the special purpose of studying conditions "at first hand," which not one in a hundred ever does, and not one in twenty knows how. Upon their arrival abroad they stop at leading cities, have dinner with other Americans there, occasionally meet a few natives of prominence, and an automobile tour in the business or manufacturing district completes the trip. The arrangement is repeated at every country visited without deviation, because the return trip is established and neither itinerary nor date will be changed.

Few Know What They're Doing

THE oversensitive foreigner feels that he is the object of needless curiosity, which hurry makes appear impertinent. He and his surroundings are examined casually, just as a passer-by would glance at a caged parrot. This sensitiveness has been accentuated by the disasters of the war. The average European, for instance, feels that the American visitor is merely passing time, and there are a few European newspapers which have satirically described these excursions as anti-prohibition evasions.

On rare occasions a very prominent man, very likely already familiar with Europe and the tasks ahead, goes on very quietly, has his conferences, lingers for weeks and months in one place, and returns without so much as whispering a word about what he has accomplished or noticed. One familiar with international banking and commerce can easily identify the three or four leading financiers and the half a dozen exporters whose life interest is foreign trade, but who do not figure in the popular foreign trade movements as they have recently been fashioned.

The government, therefore, is utterly helpless in the sphere of foreign trade. Secretary Hoover, of the Department of Commerce, has initiated a series of conferences to formulate plans—but there the matter will end. So long as he deals with formal associations whose value is theoretical but entirely in contrast with the purposes of individual members, the conferences are a loss of time. Having had an opportunity to examine their results both here and abroad, I can unqualifiedly state that for the purpose of facilitating foreign trade they are useless adjuncts. There are a score or maybe two of groups for the promotion of foreign trade, to say nothing of the foreign trade departments of banks and other co-operative bodies, who spend treasures in collecting nearly useless information which the government gets together for statistical purposes, and where it can always be found, and dependable, in case of need. Duplication and extravagance was never so great as in the foreign trade campaign.

There is, however, a more than silver lining to the usual cloud. American supremacy in foreign fields is maintained by a few business men who somehow do not figure in these discussions, and whose names are never involved in trips or statements of doubtful propriety or value.

On two separate trips to Europe, before and after the war, this supremacy came to my attention as undoubtedly it must to even the humblest of tourists or the best informed globe-trotters. Certain articles of American make of undeniably great utility and relatively low cost could always be found. They were always in great demand. Whether it be a low-priced motor car, or a safety razor, or a special fifty-seventh sauce, or a typewriter or a fountain pen—they were there to stay, and are staying. Those few worthy and advertised articles do more to uphold American productive supremacy in the minds of foreigners than all the talk about foreign trade in this country can.

The need today, because of the unsettled exchange situation, is not foreign trade as such, but the development of markets already existing. Take all of Europe. Where once it used to be the last word to say that a given article of desirable worth was French or British, today the signs abound that it is American. It is even applied to non-American things, and sold fraudulently to persons who cannot distinguish the substitution.

In Italy, in Germany, in England, in Spain, and elsewhere, before the war one could pick out the smart shop by its foreign language sign; and this was invariably in French. The French sign pre-supposed Persian goods. In certain special lines British production—with accompanying signs in English—predominated. But is it so now? It is not, although here and there some of these signs begin to reappear. The trend is for things American.

Market Must Be Developed

BUT the time has come when the American manufacturer must take hold and develop his market. The foreigner cannot do it for him, even though anxious to do so, because he does not know how. Advertising is still a crude science in foreign countries, but the rates are ridiculously high. At least, they are so for advertisements on the foreign plan and of the foreign school. An American advertising manager might make them pay.

It is not at all true that the foreigner is so temperamental that he will buy something of inferior make or do without rather than patronize an article whose origin seems to him as having lost caste. I was in Paris right after the Peace Conference broke up and when anti-American feeling was bitterest even though well concealed. One could not go into a café, a theater, or stand on a corner, without hearing something about America being apostrophied. But when it came to getting something where the pocketbook figured in the transaction, American goods had first call. The misfortune was that the distribution was so poor that in many cases disappointment made them give up the quest. There is no reason at all now why distribution should not be a hundred per cent complete.

One hears, of course, the excuse about adverse exchange. I believe that adverse exchange in this case is a mental ill. It figures very little in the majority and therefore representative cases. The potential foreign purchaser, discriminating enough to seek goods of foreign origin because of specific advantages, is not the one whose purchasing power is seriously obstructed by exchange variations. After all, foreign exchange is adverse only in relation of foreign paper to gold. Take Italy, for instance. With the lira at one-fifth or so of its par value, it may appear that the Italian purchaser of an American article finds himself unable to buy. This is not so, unless hard luck has been his share, because, there being almost five times as much paper money today as there was before the war, it is quite likely that his income has increased accordingly. Exception may be made about the white-collared classes, whose incomes have been practically stationary, but that is a condition which has obtained in the United States too, and therefore is of not greater commercial negativeness there than here.

Let me give a specific instance of what opportunities are being missed by big American producers. Preparing for a stay of several months I stocked up with twenty pairs of a favorite rubber heel that I invariably used. It was not long before new heels were needed. I went to half a dozen shoemakers, and each refused to attach them. One said he did not have the "special machinery," another that it was too much trouble to experiment with something new, and others had similarly unsatisfactory reasons. In the city where I was stopping there was an English-American club then numbering more than half a thousand members. Easily half of them were in the same fix I was; in fact, worse, because I had the heels and they could not get them. The result was that I had to attach them myself, a rather simple job, but whose most annoying operation was to sandpaper them down by hand.

Here was a potential business available to any one of that city's shoemakers, and certainly with customers able to pay for service rendered. Undoubtedly the genuine American article would cost more than anything locally made, but it was much better and therefore worth it.

Consular Information Inadequate

A FIND like this, with its commercial possibilities, would be worth any financier's trip because it would mean not only popularizing rubber heels, but the chance to install repair and finishing machinery, cleaning stands, and all the rest. One city would mean every city. The international bank whose foreign trade department could and would submit to interested manufacturers a workable program of definite promise like this is constructive. Sending a man over to make a study of the kind made lately is a costly junket that may be an imposition to the stockholders.

The nearest utilitarian trade information that reaches the United States is that which comes piecemeal from consuls on the one hand and trade commissioners of the Department of Commerce on the other. Their trade opportunity items are likely to conceal veritable commercial mines on a paying basis. But at best they can be but fragmentary. They are items picked up here and there and not carrying any definite plans on a business scale reduced to understandable terms by interested manufacturers.

Unless the government's foreign trade campaign exceeds its present limits, it is destined to remain a merely statistical organization. Whether it can emerge into something more useful is problematical. The average business man frowns upon anything bearing a governmental mark upon it. And despite what is being said about the government's foreign service information, it is the most reliable and timely information available. To say that it is unsatisfactory because it passes through official hands is ridiculous.

The government has no feathers in its cap for some of the men it has been sending abroad or for some of the mistakes of officiousness it has made, but strange to say, mistakes made by official representatives are not taken seriously anywhere. It seems an unwritten law that perfection is not possible of any governmental representative, be he high placed or otherwise. Thus any lapses committed by our special workers in foreign countries involve no costly reactions, as is the case with the really boorish attitude of some of the private representatives who make meteoric appearances in behalf of their institutions.

It seems, therefore, that the divergence between government and private institutions is indeed serious, but the greatest shortcoming is on the side of the ambitious but, nevertheless, still provincial and immature corporations that make their campaigns along patronizing lines that are intolerable to customers who, even though in need, can work out a fairly serious buying strike.

Middle West Can Do Much

IN MAKING these assertions I do not go by hearsay, but from actual knowledge and experience. I have seen at close enough range, and have even participated in its most conspicuous one, the operation of the foreign trade departments of some of the best-known financial institutions in the East. They run from fifty to several hundred employes, print highly adorned bulletins and house organs, all along the same lines, with hardly ever a single outstanding constructive point, and fail dismally when some important client calls upon them for vital credit information or for some wholesale commercial campaign. It is then that government officials are consulted, but by then so much time has been wasted that very likely enthusiasm has been negatived.

To prove it, one need but think of the plans advertised or promised immediately before and after the armistice. Hardly any manufacturer of the war-born crop, and a few older ones, cared to bother much about national trade. Foreign trade—and after that the miracle! Banks united to form special foreign trade financing groups, but so far the total of such financing is hardly discernible in the total of actual business done at home.

The Middle West ought to be especially impressed with these facts, because it has not indulged in any extravagances and has not likewise been identified with some of the less desirable tours of investigation. Moreover, I believe that it is all rot to say that foreign trade is something predestined to Atlantic seaboard states and adjacent territory.

I believe that if the United States is going to figure at all in foreign trade statistics in the near future, it will be largely due to the interest and capacity of the

A group of residences at Delhi

The Democracy of Durham

By FRANK M. CHASE

BETWEEN democracy and land is a peculiar relation. No human right is more fondly cherished than that of holding land. To do so is at once the symbol of the free man, and one of his primitive passions. Repress this desire to hold land, and the result is something quite different from democracy — perhaps autocracy at the one extreme, Bolshevism at the other. Thus to preserve democracy the nation must see to it that its conditions of land ownership are in good order.

Here in the United States we must face the distasteful fact that they are quite otherwise. Men on the soil are finding it more and more difficult to become home owners. Land tenancy is increasing in extent and in seriousness to the individual and nation. A class consciousness is developing among the tenants that is a thorn in the side of our boasted democracy. What is to be done about it? More to the point, what *is* being done about it?

Big though the problem is, and small the beginning made, California has hit upon a plan that is suggestive of great possibilities in the improvement of land-owning conditions. This is not an entirely new plan, nor a bit of the Old World transplanted in America. It is rather a cross of the two, the nature of which can be understood best by tracing the part played in its development by its originator, Dr. Elwood Mead.

Trained for engineering, Dr. Mead had held several important positions in this profession in America, when he was called to Australia in 1907 as chairman of the state rivers and water supply commission. While handling some large irrigation projects in this capacity, he came face to face with the fact that a water supply alone would not people the reclaimed land. Something needed to be done to make it possible for settlers to own and operate the land.

In search of light on this problem, he and the Australian minister of land made a study of the European systems of state aid in land purchasing, visiting Denmark, Germany, Norway, Sweden, Holland and Ireland for this purpose. During the tour two features of the systems studied particularly impressed Dr. Mead: the economies obtained through community organization, and the feeling of equality and contentment existing where all the members of a community were working more or less under state subsidy, their financial status differing little. These suggestions were borne in mind when the Australian plan for furthering land ownership was framed, the aid of the commonwealth being extended by communities instead of by scattered individuals.

Doctor Mead spent seven years in Australia. During this time he had an active part in establishing twenty-two state-aided settlements, the largest comprising 85,000 acres.

On his return to the United States in 1914, to become professor of rural institutions in the University of California, which position he still holds, Doctor Mead found the land-holding conditions of that state in serious disorder. Land promoters and speculators had plied their trade to such an extent that the state was burdened with farmers trying to operate with insufficient capital or, having failed in that, were being forced into renting under very adverse circumstances. To this situation the land barons added further complications by hanging tenaciously on to their huge holdings. A serious shortage of skilled labor also existed; this being due in no little part to the influx of Asiatics, who, with their encroachment upon the American laborer's place and their tendency toward racial grouping, were menacing the rural life of California.

Besides Dr. Mead, one other Californian was interested in bettering these conditions. This was Hiram W. Johnson, then governor. At a conference called to consider what action should be taken, Dr. Mead proposed the plan that he had helped to work out in Australia. It had brought good results there, and he believed it could be adapted to the Golden State's needs. His suggestion was approved. However, the conferees thought that the people were scarcely ready for a move so radical. Consequently it was decided to give the existing evils a thorough airing, and Dr. Mead was put at the head of the investigating committee. How necessary were remedial measures was summed up in one sentence of the committee's report: "We have not found a single settler, who, bringing with him only the limited capital accepted by state systems of other countries, has been able to pay for his land in the time agreed upon by his contract."

Doctor Mead embodied his remedy for the situation in a bill, which, passing the legislature in 1917, appropriated $260,000 for establishing the first settlement. To administer this fund the act also created the State Land Settlement Board, of which he became chairman.

Setting to work immediately, the board early in 1918 acquired by contract 6,219 acres at Durham, in the Sacramento Valley. In May of the same year the first allotments were opened to settlers. But the men obtaining land in this tract were not simply assigned to a few acres on which they might "sink or swim"; California had seen enough of such tactics under private colonization. The state had gone into the land business for purposes far different from making money. The preservation of rural democracy was involved, and it was to the state's interest, financially and otherwise, to see that the men it was staking had a chance to make good.

Accordingly an important and significant part of the board's work was performed before the arrival of the first settler. Formerly a ranch that had been farmed haphazardly by tenants and hired hands, much of it being rough and unimproved, the land in the raw tract at Durham would have offered the small operator little hope of a living. An irrigation system was therefore established, this including all but 700 acres of the tract, drainage supplied where needed, and the land divided into farms. The land also was leveled and much of it sown to alfalfa and grain. So that when even the first settlers arrived they found not only well-developed farm land but productive labor immediately before them; they thus became self-sustaining from the start.

In the laying out of the farms, the board's concern for the settlers again was well demonstrated. Before a division line was established, farm management and soil specialists carefully went over the tract, determining the size of each farm according to its topography, the nature of its soil, and the type of farming for which it was best fitted. Thus on soils suitable to intensive cultivation the farms were made small, the most of them on irrigated land consisting of from twenty to forty acres. But where the soil was better adapted to grain raising the units were larger, there being a number of 160-acre places. The farms were arranged, too, with an eye to providing good building sites with pleasant surroundings. Virtually every settler at Durham, for instance, has been able to build his house in the shade of one or more of the large oaks with which the tract was dotted when opened up for settlement.

The terms by which the settlers obtained this land were made easy and attractive—so attractive, in fact, that five applications were received for every available farm. This enabled the board to sift the applicants carefully and so choose men of decided credit to the community. The selections were made on the basis of the applicant's answers to a questionnaire, designed to show whether he was worthy of the state's assistance, supplemented by a personal interview with members of the board or their representative.

On purchasing a farm the settler paid but five per cent of its cost, his contract of sale permitting him to pay the balance in forty semi-annual installments, with interest on the deferred payments at five per cent. Put a little differently, the plan simply called for paying the interest, at a low rate, and three per cent of the principal a year. After five years from the first payment, however, the settler may, if he chooses, pay off any amount of the principal, or all of it, whereupon he would receive the deed to his property.

The state further assisted the settler by lending him, if necessary, up to 60 per cent of the cost, but not to exceed $3,000, of his house and barn and other permanent improvements, allowing him twenty years in which to remove this indebtedness. It also advanced funds for the purchase of live stock and equipment, such loans to be repaid in five years.

From the foregoing it is seen that the minimum capital necessary was enough to make the initial payment of five per cent of the cost of the land and 40 per cent of the cost of building a house and barn. For this reason the board required that the purchaser of a farm at Durham possess at least $1,500 in money or working equipment. At the other extreme the board accepted no applicant owning agricultural land the value of which, including the land applied for at Durham, was more than $15,000; no limit, however, being put on the amount of money possessed.

Other requirements of the settler were that he begin actual residence upon his land within six months of the approval of his application, that he cultivate his land to the satisfaction of the board, that he continue to live on it for at least eight months of each of ten consecutive years, and that he not sell or assign it without the consent of the board; these restrictions effectively shutting out the land speculator and safeguarding the liberal opportunity of the worker of small means.

Perhaps the most significant phase of the Durham plan is its provision for farm laborers. The 60-year-old carpenter and his wife who came to the settlement soon after it opened concretely illustrate the meaning of this. On their arrival they had just enough money to make the initial payment of $20 on one of the twenty-six small tracts that the board had set aside for the hired men. Both the man and his wife went to work. The carpenter earned $6 a day helping the other settlers erect their houses and barns, while his wife found employment in their neighbors' homes and gardens. Mornings and evenings he built their own home. By November, they were living in a bungalow on their little place on which they owed just $6; while the next year this old couple, with a new hold on life, saved a thousand dollars.

Durham thus provides the opportunity whereby the penniless hired man may not only acquire a home, but graduate into farm ownership in a few years. And this is precisely what the State Land Settlement Board expects of the more thrifty and industrious. The laborers' homes are purchased on the same long-time terms as the farms, the pay-

(Concluded on page 14)

Above—The farm laborer is a home owner and an integral part of the community at Durham.
Below—The home of a Durham farmer, whose good home with pleasant surroundings, is a part of California's liberal plan of land settlement.

Dr. Levy, a Jew, Admits His People's Error

In a Letter That Goes Straight to Mind and Heart He Shows the Bolshevik Tendency of His Race, and Deplores It

A JEW of standing, Dr. Oscar Levy, well known in English literary circles and a lover of his people, has had the honesty and the wisdom to meet the Jewish Question with truth and candor. His remarks are printed in this article as an example of the method by which Jewry can be saved in the estimation of Twentieth Century Civilization.

The circumstances were these: George Pitt-Rivers, of Worcester College, Oxford, wrote a most illuminating brochure entitled, "The World Significance of the Russian Revolution," which is published and sold for two shillings by Basil Blackwell, Oxford. The book is the result of unprejudiced observation and study and agrees with the statements made in THE DEARBORN INDEPENDENT about the personnel of Bolshevism. The manuscript was sent to Dr. Oscar Levy, as a representative Jew, and Dr. Levy's letter was subsequently published as a preface to the book.

That the reader may understand the tenor of Mr. Pitt-Rivers's book, section XVI, pp. 39-41, is herewith given in full, and is followed by Dr. Levy's comments. The italics throughout are intended to remind the reader of remarks on similar lines made in this series:

XVI The Jew Factor

IT IS not unnaturally claimed by Western Jews that Russian Jewry, as a whole, is most bitterly opposed to Bolshevism. Now although there is a great measure of truth in this claim, since the prominent Bolsheviks, who are preponderantly Jewish, do not belong to the orthodox Jewish Church, it is yet possible, without laying oneself open to the charge of anti-Semitism, to point to the obvious fact that Jewry, *as a whole,* has, consciously or *unconsciously,* worked for and promoted an international economic, material despotism which, with Puritanism as an ally, has tended in an ever-increasing degree to crush national and spiritual values out of existence and substitute the ugly and deadening machinery of finance and factory. It is also a fact that Jewry, as a whole, strove every nerve to secure and heartily approved of the overthrow of the Russian monarchy, which they regarded as their most formidable obstacle in the path of their ambitions and business pursuits. All this may be admitted, as well as the plea that, individually or collectively, most Jews may heartily detest the Bolshevik régime, yet it is still true that the whole weight of Jewry was in the revolutionary scales against the czar's government. It is true their apostate brethren, who are now riding in the seat of power, may have exceeded their orders; that is disconcerting, but it does not alter the fact. It may be that the Jews, often the victims of their own idealism, have always been instrumental in bringing about the events they most heartily disapprove of; that perhaps is the curse of the Wandering Jew.

"Only a Jew Can Save Us from the Jews"

CERTAINLY it is from the Jews themselves that we learn most about the Jews. It is possible that only a Jew can understand a Jew. Nay, more, it may be that only a Jew can save us from the Jews, a Jew who is great enough, strong enough—for greater racial purity is a source of strength in the rare and the great—and inspired enough to overcome in himself the life-destructive vices of his own race. It was a Jew who said, "Wars are the Jews' harvest"; but no harvest so rich as civil wars. A Jew reminds us that the French Revolution brought civil emancipation for the Jews in Western Europe. Was it a *Jew* who inspired Rousseau with the eighteenth century idea of the sameness of man according to nature? Dr. Kallen, a Zionist author, writes: "Suffering for 1,000 years from the assertion of their difference from the rest of mankind, they accepted eagerly the escape from suffering which the eighteenth century assertion of the sameness of all men opened to them . . . . They threw themselves with passion into the republican emancipating movements of their fellow subjects of other stocks." It was a Jew, Ricardo, who gave us the nineteenth century ideal of the sameness of man according to machinery. And without the Ricardian gospel of international capitalism, we could not have had the international gospel of Karl Marx. Moses Hess and Disraeli remind us of the particularly conspicuous part played by Jews in the Polish and Hungarian rebellions, and in the republican uprising in Germany of '48. Even more conspicuous were they in the new internationalism logically deducible from the philosophy of Socialism. This we were taught by the Jew Marx, and the Jew Ferdinand Lasalle, and they but developed the doctrine of the Jew David Ricardo.

It was Weininger, a Jew—and also a Jew hater—who explained why so many Jews are naturally Communists. Communism is not only an international creed, but it implies the abnegation of real property, especially property in land, and Jews, being international, have never acquired a taste for real property; they prefer money. Money is an instrument of power, though eventually, of course, Communists claim that they will do away with money—when their power is sufficiently established to enable them to command goods, and exercise despotic sway without it! Thus the same motives prompt the Jew Communist and his apparent enemy, the financial Jew. When owners of real property in times of economic depression feel the pinch of straightened circumstances, it is the Jewish usurers who become most affluent and who, out of goodness of their hearts, come to their assistance—at a price.

Bolshevism the "Aim" of the War

TO THESE and other statements, Dr. Levy, as a Jew, made this reply:

Dear Mr. Pitt-Rivers:

When you first handed me your MS. on *The World Significance of the Russian Revolution,* you expressed a doubt about the propriety of its title. After a perusal of your work, I can assure you, with the best of consciences, that your misgivings were entirely without foundation.

No better title than *The World Significance of the Russian Revolution* could have been chosen, for no event in any age will finally have more significance for our world than this one. We are still too near to see clearly this Revolution, this portentous event, *which was certainly one of the most intimate, and therefore least obvious, aims of the world-conflagration, hidden as it was at first by the fire and the smoke of national enthusiasms and patriotic antagonisms.*

It was certainly very plucky of you to try and throw some light upon an event which necessarily must still be enveloped in mist and mystery, and I was even somewhat anxious, lest your audacity in treating such a dangerous subject would end in failure, or what is nearly the same, in ephemeral success. No age is so voracious of its printed offspring as ours. There was thus some reason to fear lest you had offered to this modern Kronos only another mouthful of his accustomed nourishment for his immediate consumption.

I was, I am glad to report, agreeably surprised—surprised, though not by the many new facts which you give, and which must surprise all those who take an interest in current events—facts, I believe, which you have carefully and personally collected and selected, not only from books, but from the lips and letters of Russian eye-witnesses and sufferers, from foes as well as from friends of the great Revolution.

What I appreciate more than this new light thrown on a dark subject, more than the conclusion drawn by you from this wealth of facts, is the psychological insight which you display in *detecting the reasons why a movement so extraordinarily bestial and so violently crazy as the Revolution was able to succeed and finally to overcome its adversaries.* For we are confronted with two questions which need answering and which, in my opinion, you have answered in your pamphlet. These questions are: (1) How has the Soviet Government, *admittedly the government of an insignificant minority,* succeeded not only in maintaining but in strengthening its position in Russia after two and a half years of power? and (2) Why has the Soviet Government, in spite of its outward bestiality and brutal tyranny, succeeded in gaining the sympathies of an increasing number of people in this country? . . . .

Experienced Revolutionaries—Jews

YOU rightly recognize that there is an ideology behind it and you clearly diagnose it as an ancient ideology. There is nothing new under the Sun, *it is even nothing new that this Sun rises in the East* . . . .

For Bolshevism is a religion and a faith. How could these half-converted believers ever dream to vanquish the "Truthful" and the "Faithful" of their own creed, these holy crusaders, who had gathered round the Red Standard of the Prophet Karl Marx, and who fought under the daring guidance of *these experienced officers of all latter-day revolutions—the Jews?*

I am touching here on a subject which, to judge from your own pamphlet, is perhaps more interesting to you than any other. In this you are right. *There is no race in the world more enigmatic, more fatal, and therefore more interesting than the Jews.*

Every writer, who, like yourself, is oppressed by the aspect of the present and embarrassed by his anxiety for the future, MUST try to elucidate the Jewish Question and its bearing upon our Age.

For the question of the Jews and their influence on the world past and present, cuts to the root of all things, and should be discussed by every honest thinker, however bristling with difficulties it is, however complex the subject as well as the individuals of this Race may be.

For the Jews, as you are aware, are a sensitive Community, and thus very suspicious of any Gentile who tries to approach them with a critical mind. They are always inclined—and that on account of their terrible experiences—to denounce anyone who is not with them as against them, as tainted with "medieval" prejudice, as an intolerant Antagonist of their Faith and of their Race.

Nor could or would I deny that there is some evidence, some prima facie evidence of this antagonistic attitude in your pamphlet. You point out, and with fine indignation, *the great danger that springs from the prevalence of Jews in finance and industry, and from the preponderance of Jews in rebellion and revolution.* You reveal, and with great fervor, *the connection between the Collectivism of the immensely rich international Finance*—the Democracy of cash values, as you call it—*and the international Collectivism of Karl Marx and Trotsky*—the Democracy of and by decoy-cries . . . . And all this evil and misery, the economic as well as the political, you trace back to one source, to one *"fons et origo malorum"*—the Jews.

All Traces Back to Jews

NOW other Jews may vilify and crucify you for these outspoken views of yours; I myself shall abstain from joining the chorus of condemnation! I shall try to understand your opinions and your feelings, and having once understood them—as I think I have—I can defend you from the unjust attacks of my often too impetuous Race. But first of all, I have to say this: *There is scarcely an event in modern Europe that cannot be traced back to the Jews. Take the Great War that appears to have come to an end, ask yourself what were its causes and its reasons: you will find them in nationalism. You will at once answer that nationalism has nothing to do with the Jews, who, as you have just proved to us, are the inventors of the international idea.* But no less than Bolshevist Ecstasy and Financial Tyranny can National Bigotry (if I may call it so) *be finally followed back to a Jewish source*—are not they the inventors of the Chosen People Myth, and is not this obsession part and parcel of the political credo of every modern nation, *however small and insignificant it may be?* And then think of the history of nationalism. It started in our time as a reaction against Napoleon; Napoleon was the antagonist of the French Revolution; the French Revolution was the consequence of the German Reformation; the German Reformation was based upon a crude Christianity; this kind of Christianity was invented, preached and propagated by the Jews; THEREFORE the Jews have made this war! . . . . Please do not think this a joke; it only seems a joke, and behind it there lurks a gigantic truth, and it is this, *that all latter-day ideas and movements have originally sprung from a Jewish source,* for the simple reason, that the Semitic idea has finally conquered and entirely subdued this *only apparently irreligious* universe of ours.

An Anti-Semitism That Helps Jews

. . . . There is no doubt that the Jews regularly go one better or worse than the Gentile in whatever they do, there is no further doubt that *their influence today justifies a very careful scrutiny, and cannot possibly be viewed without serious alarm.* The great question, however, is whether the Jews are conscious or unconscious malefactors. I myself am firmly convinced that they are unconscious ones, but please do not think that I wish to exonerate them on that account . . . . A conscious evildoer has my respect, for he knows at least what is good; an unconscious one—well, he needs the charity of Christ—a charity which is not mine—to be forgiven for not knowing what he is doing. But there is in my firm conviction not the slightest doubt that these revolutionary Jews do not know what they

are doing; that they are more unconscious sinners than voluntary evildoers.

I am glad to see that this is not an original observation of mine, but that you yourself have a very strong foreboding about the Jews being the victims of their own theories and principles. On page 39 of your pamphlet you write: "It may be that the Jews have always been instrumental in bringing about the events that they most heartily disapprove of; that maybe is the curse of the Wandering Jew." If I had not the honor, as well as the pleasure, of knowing you personally, if I were not strongly aware of your passionate desire for light and your intense loathing of unfairness, this sentence, and this sentence alone, which tells the truth, will absolve you in my eyes from the odious charge of being a vulgar anti-Semite.

No, you are not a vulgar, you are a very enlightened critic of our Race. *For there is an anti-Semitism, I hope and trust, which does the Jews more justice than any blind philo-Semitism,* than does that merely sentimental "Let-them-all-come Liberalism" which in itself is nothing but the Semitic Ideology over again. *And thus you can be just to the Jews, without being "romantic" about them.*

Linking Capitalism With Communism

YOU have noticed with alarm that the *Jewish elements provide the driving forces for both Communism and capitalism,* for the material as well as the spiritual ruin of this world. But then you have at the same time the profound suspicion that the reason of all this extraordinary behavior may be the intense Idealism of the Jew. In this you are perfectly right. The Jew, if caught by an idea, never thinks any more in watertight compartments, as do the Teuton and Anglo-Saxon peoples, whose right cerebral hemisphere never seems to know what its left twin brother is doing; he, the Jew, like the Russian, at once begins to practice what he preaches, he draws the logical conclusion from his tenets, he invariably acts upon his accepted principles. It is from this quality, no doubt, that springs his mysterious force—that force which you no doubt condemn, but which you had to admire even in the Bolshevists. And we must admire it, whether we are Jews or whether we are Christians, for have not these modern Jews remained true to type, is there no parallel for them in history, do they not go to the bitter end even in our day? . . . .

Who stirred up the people during the late war in Germany? Who pretended to have again the truth, *that* truth about which Pontius Pilate once shrugged his shoulders? Who pleaded for honesty and cleanliness in Politics, *that* honesty which brings a smile to the lips of any experienced Pro-consul of today? Writers, who were mostly Jews: Fried, Fernau, Latzko, Richard Grelling—the author of "Jaccuse." Who was killed and allowed himself to be killed for these very ideas and principles? Men and women of the Jewish Race: Haase, Levine, Luxemburg, Landauer, Kurt Eisner, the Prime Minister of Bavaria. From Moses to Marx, from Isaiah to Eisner, in practice and in theory, in idealism and in materialism, in philosophy and in politics, they are today what they have always been: passionately devoted to their aims and to their purposes, and ready, nay, eager, to shed their last drop of blood for the realization of their visions.

"But these visions are all wrong," will you reply. . . ."Look where they have led the world to. Think, that they have now had a fair trial of 3,000 years' standing. How much longer are you going to recommend them to us and to inflict them upon us? And how do you propose to get us out of the morass into which you have launched us, if you do not change the path upon which you have led the world so disastrously astray?"

To this question I have only one answer to give, and it is this: "You are right." This reproach of yours, which—I feel it for certain—is at the bottom of your anti-Semitism, is only too well justified, and upon this common ground I am quite willing to shake hands with you and defend you against any accusation of promoting Race Hatred: *If you are anti-Semite, I, the Semite, am an anti-Semite too, and a much more fervent one than even you are . . . .We (Jews) have erred, my friend, we have most grievously erred. And if there was truth in our error 3,000, 2,000, nay, 100 years ago, there is now nothing but falseness and madness, a madness that will produce an even greater misery and an even wider anarchy. I confess it to you, openly and sincerely, and with a sorrow, whose depth and pain an ancient Psalmist, and only he, could moan into this burning universe of ours . . . . We who have posed as the saviours of the world, we who have even boasted of having given it "the" Saviour, we are today nothing else but the world's seducers, its destroyers, its incendiaries, its executioners . . . .* We who have promised to lead you to a new Heaven, we have finally succeeded in landing you into a new Hell . . . . There has been no progress, least of all moral progress . . . . And it is just our Morality, which has prohibited all real progress, and—what is worse—which even stands in the way of every future and natural reconstruction in this ruined world of ours . . . . I look at this world, and I shudder at its ghastliness; I shudder all the more as I know the spiritual authors of all this ghastliness . . . .

Jews Shirk Duty to Europe

BUT its authors themselves, unconscious in this as in all they are doing, know nothing yet of this startling revelation. *While Europe is aflame, while its victims scream, while its dogs howl in the conflagration, and while its very smoke descends in darker and even darker shades upon our Continent, the Jews, or at least a part of them and by no means the most unworthy ones, endeavor to escape from the burning building, and wish to retire from Europe into Asia, from the somber scene of our disaster into the sunny corner of their Palestine. Their eyes are closed to the miseries, their ears are deaf to the moanings, their heart is hardened to the anarchy of Europe: they only feel their own sorrows, they only bewail their own fate, they only sigh under their own burdens . . . .* They know nothing of their duty to Europe, which looks around in vain for help and guidance, they know nothing even of their own great ancestor to whose heart the appeal of pity was never made in vain: they have become too poor in love, too sick at heart, too tired of battle, and lo! these sons of those who were once the bravest of soldiers are now trying to retire from the trenches to the rear, are now eager to exchange the grim music of the whistling shells with that of the cow-bells and vintage songs in the happy plain of Saron . . . .

And yet we are not all Financiers, we are not all Bolshevists, we have not all become Zionists. And yet there is hope, great hope, that this same race which has provided the Evil will likewise succeed in supplying its antidote, its remedy—the Good. It has always been so in the past—was not that fatal Liberalism, which has finally led to Bolshevism—in the very midst of that dark nineteenth century, most strenuously opposed by two enlightened Jews—Friedrich Stahl, the founder of the Conservative Party in Germany, and by Benjamin Disraeli, the leader of the Tory Party in England? *And if these two eminent men had no suspicion yet that their own race and its holy message were at the bottom of that unfortunate upheaval, with which their age was confronted*: how eager, how determined, how passionate will be the opposition of the Disraelis of the future, once they have clearly recognized that they are really fighting the tenets of their own people, and that it was their "Good," their "Love," their "Ideal," that had launched the world into this Hell of Evil and Hatred. A new "Good" as new Love, a true Love, an intelligent Love, a Love that calms and heals and sweetens, will then spring up among the Great in Israel and overcome that sickly Love, that insipid Love, that romantic Love, which has hitherto poisoned all the Strength and all the Nobility of this world. For Hatred is never overcome by Hatred: it is only overcome by Love, and it wants a new and a gigantic Love to subdue that old and devilish Hatred of today. That is our task for the future—a task which will, I am sure, not be shirked by Israel, by that same Israel which has never shirked a task, whether it was for good or whether it was for evil . . . .

Yes, there is hope, my friend, for we are still here, our last word is not yet spoken, our last deed is not yet done, our last revolution is not yet made. *This last Revolution, the Revolution that will crown our revolutionaries, will be the revolution against the revolutionaries.* It is bound to come, and it is perhaps upon us now. The great day of reckoning is near. It will pass a judgment upon our ancient faith, and it will lay the foundation to a new religion. And when that great day has broken, when the values of death and decay are put into the melting-pot to be changed into those of power and beauty, then you, my dear Pitt-Rivers, the descendant of an old and distinguished Gentile family, may be assured to find by your side, and as your faithful ally, at least one member of that Jewish Race, which has fought with such fatal success upon all the spiritual battlefields of Europe.

Yours against the Revolution and for Life ever flourishing,

OSCAR LEVY,

ROYAL SOCIETIES CLUB,
ST. JAMES STREET,
LONDON, S. W.,
JULY, 1920.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

A second book, containing the second twenty articles, will soon be ready and may be ordered now.

Jewish World Notes

"Mrs. Jules Hart, of Yonkers, in leading the round table discussion on legislation this afternoon at the closing session of the New York State Council of Jewish Women at the Colonie Country Club, objected to the use of Christian songs in the public schools and recommended that the council ask the board of regents to eliminate them.

"Mrs. William D. Sporborg, of New York, president of the new organization just formed yesterday, also spoke along these lines and said that in several meetings of the federated clubs of which the Jewish council was a part, the Catholic priests and Protestant ministers, reciting benedictions and giving the invocations, used Christian expressions which were not fair to the Jewish women. When the Jewish rabbi was asked to speak no reference was made which would offend any religion, Mrs. Sporing said."—Albany *Evening Journal.*

What is needed in this country is not Jewish laws which gag free speech and throttle a free press, laws which make it a crime to identify and study Jewish activity and Jewish influence on American life, but a law like this:

"That if two or more persons conspire to injure, suppress, threaten or intimidate any person in the free exercise and enjoyment of his right, privilege or immunity to propose, advance, discuss, agitate for or promote by lawful means a course of study or research for the public information upon the influence of any racial, political or moral current in the life of the nation, they shall be fined not more than $5,000 or imprisoned not more than five years or both."

It is apparent that whereas in time past the guard of the law was required over breaches of constitutional rights on the side of license, there is need now of laws to protect constitutional rights against suppression of them. To prevent free speech is a greater crime than to commit libel, for libel may be redressed, but what law redresses enforced silence? Will the B'nai B'rith, which has been instrumental in introducing gag laws in nearly every state, use its influence to draft and enact laws safeguarding this fundamental constitutional right? Hardly! Those who most oppose free speech have most to fear from it.

"A distinguished American author and playwright is up for heated discussion over a play he has submitted to several Broadway managers. It still hungers and thirsts for a producer. The author has told some intimate friends that the cause of the rejection lodges in the fact that he owns 10 per cent of the stock of a hotel in New England which excludes Jews!"—Philadelphia *Public Ledger.*

On February 18, Dr. Judah L. Magnes, head of the New York Kehillah, was arrested, together with two girl pickets, at a clothing strike. When arraigned before the magistrate, all three were convicted. Upon appeal, the rabbi was released, but the two girls were fined.

To date, there is no evidence that the leaders of Jewry have attempted to boycott the G. A. R. or to prevent the holding of their next reunion because of the sentiments expressed at the National Staff Association banquet at Boston.

In the Federal Court at Cleveland, the city officials were enjoined against interfering with the sale of THE DEARBORN INDEPENDENT. In rendering his decision, Judge Westenhaver said: "The publication complained of cannot by any stretch of imagination be classified as indecent, obscene or scandalous, but if it were, the limit of the city's power would be to conduct prosecutions for specific offenses and not by the establishment of a censorship in advance and prohibition of sales." The terms "indecent, obscene, scandalous" appear in the Jewish complaints against this paper. They would be more serviceable in describing certain Jewish theatrical spectacles.

It is reported that Mr. Einstein, who received unusual civic honors in New York as a scientist, though, as some suspect, really as a Jew, has refused all invitations to debate his theory with qualified Americans. He has scarcely been heard of since his arrival.

The New York police force seems to have gone anti Semitic. They seized so much passover wine in their raids upon illicit liquor stocks, and upon Jewish congregational officials who took advantage of their office to engage in bootlegging, that none is left for ritual purposes. Still the American people do not understand that the Jewish people are the only ones in the United States who are exempt from the Eighteenth Amendment.

A steady procession of Jews has been going to the White House since the inauguration of President Harding. Mr. Harding is President of all the people and receives them as he would anyone else. But the incidents of some of the meetings will make excellent reading one day.

Within the Sacred Precincts of Diplomacy

Mr. Schreiner during the war was a correspondent for the Associated Press and traveled in the Central Empires until the United States cast its lot with the Entente. The facts are of the type which every honest newspaperman seeks to place before his reading public. These articles are interesting bits of history heretofore denied the American people by Congress

By GEORGE A. SCHREINER

Author of "The Iron Ration," "From Berlin to Bagdad," "The Craft Sinister"

WHEN the gods of Greek mythology hied themselves to Elysium, they left behind all the offspring they had with the fair daughters of Hellas. For centuries thereafter—taking Homer's version for it—that offspring ran much of the affairs of mankind. It did that usually in a most peculiar manner, and we may conclude, therefore, that our diplomatists are lineal descendants of the Greek gods—no mere humans, in other words.

This view of the case may be looked upon as the queerest of logic. It may be said for it, however, that it is every bit as logical as diplomacy itself. Also, this strange hypothesis finds ample justification in the opinion the diplomatist has of himself, which opinion, by the way, is fervently supported by those who have never penetrated into the holy of holies of diplomacy. Diplomatists are super-men, of course. In weak moments they may admit to themselves that they are of dust, but none has yet been found who would admit this—even to his wife or his valet.

It is a well-known fact that no ambassador or minister has ever so much as batted an eyelash before an irate minister for foreign affairs, premier, president or kingly ruler. The diplomatist does nót have to do that. Once he has been annointed by governmental infallibility, he is himself infallible. This is conceded by all. It is part of his stipend. And though there be little enough sense in some of those who direct the weal and woe of nations they all have sufficient intelligence of a sort not to question the infallibility of those upon whom the oil of the diplomatic and governmental cult has fallen. To do that might result in disaster.

By and large the diplomatist is well protected. He does as he pleases, until he is found out. Found out in times of peace he goes on a vacation; discovered in times of stress he is recalled. On but rare occasions has a diplomatist been *Dumbaized*. Dr. Alexander Dumba, who, it will be recalled, was sent home by Mr. Wilson during the war, was not inappropriately named. Taking the last letter off his name, we have an adjective with a slang meaning all its own. His case, however, was exceptional.

Sending Morgenthau to Turkey

I MET Mr. Dumba in the famous Ballhausplatz building in which is housed the ministry of foreign affairs in Vienna. Oscar Ritter von Montlong, then chief of the press department of the ministry, thought it proper to introduce us to one another. Dr. Dumba caught my name and connection and fled in dismay, mumbling a few words to the effect that, while he was glad to meet me, he had really nothing to say. To which Von Montlong added a second later that Dr. Dumba thought the American newspaperman the most dangerous individual on earth, to which I also agreed.

Ambassadors and ministers write autobiographies in the spare time they have recently had between writing war books of the claptrapest variety. It is a good thing that the autobiographies are generally printed for private circulation only—with a wonderful print on wonderful paper, within a more wonderful binding emblazoned by the crest of the house of the diplomatist.

To read the books of diplomatists one would take it for granted that at their posts they were everything. To read two such books will show even the novice how much power two men can have in a single sphere, and to read three leaves us dumbfounded in contemplation of how so much force, will, initiative, energy and noble volition could be unfolded within so narrow a confine as this little planet of ours.

In Constantinople, the newspaperman met Mr. Henry Morgenthau, Sr., representing at that time the United States at the Sublime Porte. To represent the greatest republic on earth at so marvelous a place as the Alibabi, to wit: Sublime Porte, was a great honor, of course. And Mr. Morgenthau felt that honor, naturally.

Mr. Morgenthau was at Baltimore in 1912 and was one of the first to shake the presidential nominee's hand. Mr. Wilson never forgot that, nor did the Democratic national committee forget that the real estate operator had made a handsome contribution to the campaign exchequer.

There was but one post open for the aspirant. For years and years Constantinople had been a post *de convenance*, as our Gallic associates would call it. To the Sublime Porte were sent men for whom it was hard to find a place elsewhere. At the European capitals certain social and racial lines had been drawn. The barbarous Turk was more democratic, and at one time too corrupt, to draw such lines. Moreover, the Sultan had under his rule many of Mr. Morgenthau's coreligionists, and what was more to the point, the United States owns its own ambassadorial palace in Pera, so that no rent had to be paid. The salary of a United States ambassador is $17,500 a year, just enough to keep his excellency in little change for tips; with free quarters thrown in, Constantinople was a good post then.

Ambassadorial appointments are really poor investments, though they are not without glory, of course. Mr. Morgenthau did not mind that because money was no object with him. His real estate deals had been most profitable. He was usually the head in the large syndicates he organized. In a single deal he made $480,000, and his promotion schemes all over New York City, from Lower Broadway to the swamps along the East and Bronx rivers, netted him a huge fortune, compared to which the handsome income from a typewriter concern was but pin money.

What the future ambassador of the United States to Turkey thought of money is best shown by a little remark he made on the occasion of a dinner at Delmonico's some time in 1912.

"Yes," he said, "a man who is worth only a million is not in respectable society, nowadays. He must have millions or he does not count."

Mr. Morgenthau wanted to be ambassador to Turkey, a post which had been filled by other Jews. It so happened in 1912 that Mr. Wilson and a new governor of the state of New York had to be elected. Funds were needed for that. Mr. Morgenthau contributed lavishly and got members of his family to do likewise. When the campaign was in fairly good swing, the Democratic party was indebted, morally, to the Morgenthau family to the following extent:

Henry Morgenthau, Sr., (first contribution)	$30,000
Henry Morgenthau, Sr., (second contribution)	10,000
Henry Morgenthau, Jr.,	1,000
S. M. L. Morgenthau,	100
G. L. Morgenthau,	250
Maximilian Morgenthau,	100
	$41,450

But it seems that this was not yet the total of what Mr. Morgenthau spent in that campaign.

In September of the next year ex-Governor Sulzer of New York was cited to appear before an impeachment court. Mr. Morgenthau also appeared in the rôle of witness, because a check of his was one of the exhibits. Mr. Morgenthau explained to the court that he had handed this check for $1,000 to Mr. Sulzer in a moment in which he was "foolishly generous." According to the testimony, Mr. Morgenthau was sitting in his office at the Democratic National Headquarters at 200 Fifth Avenue, on October 5, when Mr. Sulzer walked in. Mr. Morgenthau gave him a check for $1,000 from his own funds. According to the testimony, Mr. Sulzer did not expect to get such a check, which caused the impeachment court to put a good many questions, of which two are relevant.

Question by Senator Coates:

"I would like to ask Mr. Morgenthau if, had Mr. Sulzer not been a candidate for governor, he would have given the $1,000 as spontaneously as he did?"

Mr. Morgenthau: "Certainly not!"

Question by another member of the court:

"Was it for the purpose of creating better understanding or more intimate relations between yourself and William Sulzer after he should have been elected governor, knowing that he would be elected?"

Mr. Morgenthau: "No, sir."

Just before, Mr. Morgenthau had admitted that he was sure of Mr. Sulzer's election.

Mr. Sulzer had been elected governor, and on March 18, 1913, there was given a dinner in his honor by his friends at the Café Boulevard. The governor had meanwhile attracted the attention of those who wished him harm, and Mr. Morgenthau found it necessary to support and encourage him, doing this in words that betrayed the keenest interest in Mr. Sulzer.

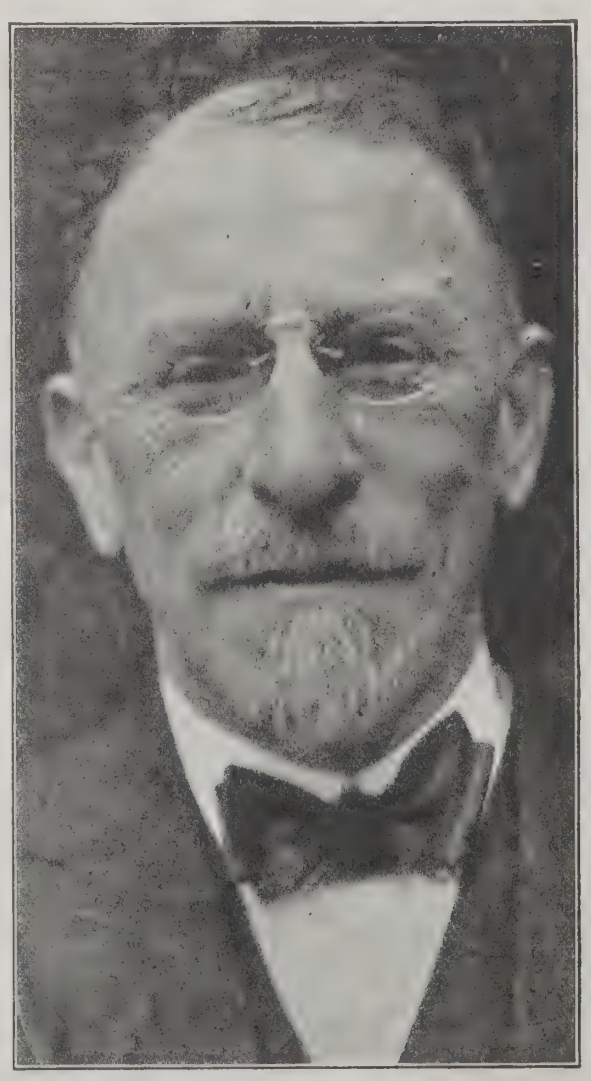
"The people look to you not to yield," said Mr. Morgenthau. "Self-seeking men no longer govern the state. The people have sent you a message to march straight on, and if you yield you will be overwhelmed. Your one master is public opinion, and you must stand like a rock, come against you who may."

A little later the governor was before the impeachment court, and Mr. Morgenthau's check was among those that figured in the trial.

Within a few days of Mr. Morgenthau's appearance before the impeachment court, Mr. Wilson sent his nomination as ambassador to Turkey to the United States Senate. It was promptly accepted, and Mr. Morgenthau was generously fêted before he left for his post.

Mr. Morgenthau made a good impression in Turkey, according to the newspaper dispatches written before the newspaperman appeared on the scene. The American ambassador admitted having been asked by the Turkish Government to accept a post in the Ottoman ministry, as minister of agriculture, besides attending to his duties as ambassador of the United States. He declined, however, though that did not prevent the Turkish Government from presenting a member of the ambassador's family with the Shefakat Order of the first class, the man mainly responsible being Enver Pasha, Ottoman minister of war, upon whom Mr. Morgenthau has since fastened a good half of the responsibility for the propaganda-augmented Armenian atrocities, bestowing the other half upon Talaat Pasha, who was recently assassinated in Berlin.

On March 3, 1916, Mr. Morgenthau was interviewed in regard to the situation in Turkey. He informed the New York reporters that the Turk was not half a bad chap, if you knew him. And the ambassador knew the Turk well, it seems.



Rumors reached him to the effect that Turkish soldiers had occupied the buildings of the Masovan College for Girls. He was indignant. Being a man of action, and not bound by the regular rules of diplomatic intercourse, Mr. Morgenthau got the Sultan on the telephone. The following conversation ensued, according to Mr. Morgenthau:

The ambassador of the United States:

"Can you see me on an important matter?"

His Majesty, Sultan Réchad Khan V, Khalifa, Ghazi, and so on:

"Yes, come right over."

HENRY MORGENTHAU,

Formerly United States Ambassador to Turkey

Knew Nothing But Turkish

THE newspaperman may say that this is somewhat of an enigma. During a twenty-seven minutes' audience which he had with His Majesty, an interpreter had to function, because the Sultan knew neither English, French nor German—nothing, in fact, but Turkish, of which language Mr. Morgenthau knew as much at that time as did the newspaperman.

Mr. Morgenthau left his post at Constantinople to assist in the re-election of Mr. Wilson. In October of 1916, he issued an appeal for funds for the Democratic campaign to the extent of $500,000, but was $270,000 short of this when the election was over. All of the money Mr. Morgenthau raised was gotten on the plea of: "He kept us out of the war." For a time, indeed, Mr. Morgenthau was convinced that the United States should not participate in the war. On March 8, of that year he made the statement:

"And so we should, and we must, keep out of the war."

The statement was an incident to Mr. Morgenthau's protest against the efforts that were being made at the time to drag the country into the war. He could not see the necessity for this at that time, because he knew that conditions in Turkey were radically different from what he pictured them later. His own son, Mr. Henry Morgenthau, Jr., made the following statement in London in an interview:

"In Constantinople itself there is little evidence of German domination. The city is well policed and orderly."

On March 21, 1916, Mr. Morgenthau took pains to point out to an audience of coreligionists that the

Turks were kind to the Jews; while a little while later he delighted in painting the Turk the worst of savages, and the German his vicious master. The number of massacred Armenians increased with every speech Mr. Morgenthau made in behalf of the Near East relief funds, with the Armenians getting quite the least share of the money that was thus extracted from the American public. By and by, the ex-ambassador had more Armenians killed than lived at any time in the districts affected by the uprising. The numbers grew by the hundreds of thousands, though a good British soldier, General Macwisky, has just come out with a book in which he explodes this Morgenthauiade.

Shortly after his arrival in the city on the Golden Horn, Mr. Morgenthau was confronted with his first diplomatic problem. The United States Government had sold to the Greek Government, through a jobber by name of Fred J. Gauntlett, the superannuated ships of the line: "Idaho" and "Mississippi" for the bargain price of $12,636,276.98. How the 98 cents came to be on the bill is not known. To be sure, the ships were marked down, but there is no other instance recorded in the history of man in which two cents were lopped off a dollar in the sale of two perfectly good, though second-hand, battleships.

Mr. Morgenthau did not fix this price. What he found awkward was that the Ottoman Government wanted to know why the United States had sold these two ships to the Greeks. There are in my possession several diplomatic telegrams from M. de Giers, at that time Russian ambassador to Turkey, in which he informs his great chief Sazonoff in Petrograd that the Turkish Government had assured him that it was arming only against the Greeks. Thus it came that the men in Stamboul did not take kindly to the sale of the battleships.

Mr. Morgenthau tried to explain the deal to Said Halim Pasha, the grand vizier, who served under his inferior ministers, Enver Pasha and Talaat Pasha, the latter still a *bey* at that time. Buying and selling real estate was one thing, explaining a diplomatic situation was quite another. The grand vizier had a thin beard of the Oom Paul Kruger brand, and while he stroked it with his dainty hand, the ambassador was striving hard to find words. Said Halim's Oxford training had eliminated much of the ferocity one might expect.

Mr. Morgenthau was asked to send a polite feeler to Mr. William Jennings Bryan, just then holding down the chair of the Secretary of State. That feeler was to ascertain whether or not it would be possible to undo the sale of the two American battleships. Halim Pasha thought that the thing was pretty close to being an unfriendly act, to which the ambassador replied that it seemed to him to be a mere business transaction. The Turkish grand vizier tried hard to demonstrate to Mr. Morgenthau that some business deals, even bargain sales in battleships, might be construed into unfriendly acts, and that war had been declared for much less than that.

It would have been better had the ambassador sent a little cipher dispatch to Mr. Bryan. But that he did not do. He considered that as ambassador of the United States he alone was in charge of relations with Turkey, in which view Mr. Morgenthau was supported by Sir Louis Mallett, the British ambassador, whose advice he was frequently given.

Sir Louis of Great Help

MR. MORGENTHAU has been criticized for having been too thick with Sir Louis. Knowledge of the facts and compassion compels the newspaperman to say that there was no way out. The successful real estate man was as innocent of diplomacy as a new-born babe. Since he was on post he had to make a showing. The British ambassador realized that the predicament of his colleague was great, and, being brought up in the school of British political philanthropy, he promptly came to the rescue. After that, Said Halim Pasha found Mr. Morgenthau most obdurate.

The American ambassador repaid this kindness. When the Turks had closed the straits—the Bosphorus and the Dardanelles—Sir Louis Mallett was most wroth. In his studied outbreak of diplomatic passion, Sir Louis was amply and ably supported by M. Bompard, the French ambassador, in whom a natural anger nearly ruined an otherwise accomplished diplomatist. The two called upon the ambassador of the United States to go to the Sublime Porte and give the grand vizier a piece of his mind.

To act as the spokesman for two such governments as the British and French was a great honor for Mr. Morgenthau. He repaired to the Alibabi in his great automobile and with a glorious arnaut cavass and confronted the Ottoman prime minister with the words:

"You know this means war!"

Said Halim almost fainted. It was not the possibility of war that took his breath away, but the new sort of diplomatic conversation inaugurated by the American ambassador. When the grand vizier was himself again, he informed Mr. Morgenthau politely, yet firmly withal, that he had better mind his own business and leave all diplomatic relations between the Imperial Ottoman Government and the diplomatic representatives of Great Britain, France and Russia in those channels in which they were intended to move.

For M. de Giers, the Russian ambassador, Mr. Morgenthau had little love. He hated Russia and all things Russian with an aversion that was deep and honest.

It was this plane upon which he and Baron von Wangenheim, the German ambassador, met often and well afterward. In his book on his diplomatic career, from the pen of Burton Hendricks, Mr. Morgenthau tries hard to make the reader feel that he had no use for the tall and elegant Prussian in the palace on the Boulevard Ayas Pasha. It was not always thus. There was a time when he and Wangenheim were intimate—rather. That time extends to the day on which Mr. Morgenthau left his post for good to assist in the re-election of his friend Mr. Wilson. Mr. Morgenthau confided to many that except for him the great pacifist in the White House might not be re-elected. He left Constantinople with the prayers of all accompanying him. It would not have taken much to have the Turkish Government order a special service of prayers in the Hagia Sofia, imploring Allah not to return the great *kadi* of the *Amerikann serai*.

Mr. Morgenthau was considered in Constantinople *persona non grata* to so extreme an extent that his reasons for leaving the Ottoman capital could be accurately determined by the flip of a coin. Head showing, Mr. Wilson's campaign lost; tail showing, the aversion of the Sublime Porte won.

In his book, the ambassador would have us gain the impression that on the Golden Horn he was the *multum in parvo*. That is not so, exactly. Applying the methods of the real estate operator to diplomacy will not do, even if one deals with so barbarous a lot as the Turks. Moreover, the grand vizier was an Egyptian who at Oxford had imbibed all that is superlative in English culture.

The American ambassador was not so omnipotent, therefore. In fact he was anything but that.

Captain J. P. Morton, commander of the United States small cruiser "Scorpion," and Captain R. H. Williams, of indefinite standing as military attaché in the spare time left him by his relief work, wanted to see what was doing at the Dardanelles and on Gallipoli. Their interest in the operations of the Allies and Turks was legitimate. Captain Morton would have failed in his duty had he permitted this wonderful opportunity to pass unheeded, with Captain Williams guilty of the same remissness. The first as naval officer, and the second as officer of the United States coast artillery, had to see what the effect of the titanic struggle between modern battleship and coast battery was. The newspaperman had given the two officers all the data he could dispense without being guilty of uttering vital military secrets, but they had to see the lay of things themselves. Morton was much concerned with the maneuvering of the British and French ships, their fire practice and what not, and Williams wanted to see the effect of modern super-artillery upon the old earthworks of the Turkish batteries along the straits. In the national defense scheme of the United States the information they might gather could become of the greatest importance. Needless to say, the two captains were anxious to get to the fronts in question.

After a while they grew fretful. Mr. Morgenthau was importuned early and often. The ambassador did his best. But he had fallen from grace in the Alibabi and the ministry of war. The grand vizier endorsed his wishes, nevertheless, but left their realization in the hands of Enver Pasha, Ottoman minister of war, and Talaat Bey, minister of the interior and what not at that time.

Enver Pasha made many promises and kept not a one. Being somewhat of a diplomatist himself, he never said *no*, but spoke of the prospects of the future. For this reason he did not fare so well in Mr. Morgenthau's book. Talaat offended similarly and got his share of the ambassador's ire.

Captains Morton and Williams persisted. When it was clear to them that they would not get to the Dardanelles and Gallipoli via the embassy, they made up their minds to appeal to the endorsement of the newspaperman. There were several reasons why the writer did not care to engage in that sort of *pourparler*. In the first place attachés were taboo at those fronts; second, what the great man in the Italian palace on the *rue* Kabristan could not accomplish he had no hopes of accomplishing. Also, military and naval attachés are not in the habit of doing anything for mere scribes; moreover, it has never paid the latter to butt into affairs not strictly their own.

However, the newspaperman meant well enough by the two captains. A little dinner was arranged by the latter for the former and the thing was discussed. The newspaperman, seeing a citizen's duty in getting the attachés to the front, promised to do what he could.

Encouragement was given him about noon on the following day. Mr. Morgenthau called him into his *sanctum sanctorum* and confessed that he was without the necessary influence and standing to get the two captains to the front. Would the newspaperman use his influence and standing to get Captains Williams and Morton to the said fronts?

The newspaperman promised that he would do his best. That best was at first unproductive of the desired result, but in the end the two officers were allowed to make the trip.

A result of Italy's entering the war was that Italian and Russian interests in the Ottoman Empire were thrown upon the street together. Protection had to be found for them. After the neutral governments of Europe had declined the job, Rome and Petrograd turned to Washington, D. C.

Thus was conjured up the great crisis in the life of Mr. Morgenthau. The Department of State asked him to charge himself with the care of the Russians and their interests in Turkey. Mr. Bryan thought nothing of this, but Mr. Morgenthau did.

He needed advice. But that was hard to find now. Sir Louis Mallett and Monsieur Bompard were out of reach. In his own *conseiller* and first secretary, Mr. Hoffman Philip, Mr. Morgenthau had little confidence, because the said *conseiller* did not always agree with him. For the counsel of Mr. Tarler, and a few other boys learning the diplomatic trade under the aegis of himself, Mr. Morgenthau could have no respect, of course. There was Mr. Shamavonian, the dragoman. At best he had but the Levantine view of things.

MR. MORGENTHAU, in Washington.

Audience Seats Himself

SO MR. MORGENTHAU was reduced to the necessity of having to appeal to the newspaperman.

The ambassador was pacing up and down, as the caller entered the office. He seemed much perturbed, and still the perturbation was not entirely real. Most, if not all, of it was for the audience of one.

The audience seated himself.

The ambassador cast a glance at him, screwed his face into something resembling great mental strain and continued his perambulations, without saying a word.

After a while, the psychological moment was come. The anguish within the ambassador had loosed itself so that speech was possible.

A sad tale was unfolded. He, the ambassador, had been asked by *his* government to take in charge, and care for, the subjects of the Russian czar and their interests. It would be impossible to comply with that request. How could he, a self-respecting Jew, take care of the subjects and interests of a government that had for years and years persecuted and pogromed his coreligionists in Russia? That was out of the question. It could not be done. He could not do it. He would not do it.

The audience had no words to meet such determination. He said nothing and the ambassador continued his march from door to window past the fireplace.

Presently, the perturbed man stopped near the caller.

What did the caller have to say to that?

The caller said that he had nothing to say. Such matters were beyond his province entirely.

He would resign, rather than take that commission, said the ambassador. The caller found that proper enough, but suggested that finally it was all a matter of ascertaining just why the post had been filled by Mr. Morgenthau. Was he in Constantinople as a citizen of the United States and diplomatic representative of its government, or was he there as an individual at liberty to serve a cause which after all was but a product of emotion?

The ambassador continued to give voice to his indignation. What would *his* people say to all that? Would they not be justified in execrating the very memory of him? He would resign. There was a limit to what a government could ask of the citizen.

The agreement between ambassador and newspaperman was that on the morrow the world would learn what its fate was to be. Mr. Morgenthau had dismissed the caller with the remark that overnight he would make up his mind, but that, probably, the Department of State would be the scene of considerable excitement.

The newspaperman wrote a dispatch of Mr. Morgenthau's acceptance first. He put it into one pocket, and the resignation dispatch in another. The following morning he went to the telegraph office near the Galata Serai and filed the acceptance.

Within the ambassador a great struggle had taken place, and the diplomatist had gained the upper hand.

All the world knows that Mr. Morgenthau wrote a book with a long title. The book has been looked upon as one of the great documents of the war, if the word of critics may be taken for it. Mr. Morgenthau returned to this country without so much as a single note on the most important events, and he and his amenuensis needed data. Who could supply it? The ambassador thought of the newspaperman, wrote him a note and extended an invitation to luncheon at the Yale Club. The newspaperman accepted.

The ambassador, his secretary, Mr. Antonian, and Mr. Burton Hendricks seated themselves at a table for four. No time was to be lost. Mr. Morgenthau began to question the newspaperman on all manner of things—the bombardment of the Dardanelles, the actions on Gallipoli, the interior of Asia Minor, the Armenian crisis, Talaat Pasha, Enver Pasha, Liman von Sanders Pasha, Von Wangenheim, Corvette-Captain Humann, Von der Goltz Pasha, Germano-Turkish relations, Prince Wolf-Mettermich, Dr. Richard von Kuehlmann.

The newspaperman answered, and the secretary took it down in short hand, first on his knee and then on the table—quite frankly. It was 1:30 when Messrs. Morgenthau and Hendricks began to interview the professional interviewer. At six that evening they were still at it. Most of Mr. Morgenthau's book had been dictated by the newspaperman, as he thought. As a matter of fact he was mistaken. Messrs. Morgenthau and Hendricks trimmed the statements to suit their purpose, and when the great book appeared on the market finally it contained a credit line to the effect that at this time the ambassador succeeded in getting to the front a certain newspaperman, with which achievement he had as little to do as the man in the moon.

"Receipt room" in the Robinson family home, where receipted bills paid for the circus supplies and expenses for each year, beginning in the late '50's, are kept in trunks.

"Cutting Up Old Circus Money" V. Nomading Olden Trails

By HARRY BARNET

IN TRUNKS, stored on the top floor of the family home of "Governor" John F. Robinson at the former winter quarters of his circus in the Little Miami country near Cincinnati, are receipted bills for each expenditure made during the circus seasons, beginning as far back as the late 1850's, and ending a few years ago, when the circus that had been, in succession, the property of his father, himself, and of his son for a hundred years, passed into other hands.

The bills for each year are kept in separate trunks, together with the statistics of the show—the amount of the receipts at each performance; the prices paid for licenses, rent of "show lots," pay rolls signed by famous tent showmen and women who drew the money; and even notations as to the character, and the likes and dislikes, of the people who lived in the different parts of the United States visited by the circus during that year.

It's a motley collection of information, but each scrap of paper in it holds a story to the "Governor." He knows the how and the why of the majority of these notations.

"We were the first big show to get into Texas," he said one afternoon, when we were rummaging through the more aged of the trunks, and he came across a receipted hotel bill, signed by the sheriff of a Texas county.

"That was very early in 1850," he continued, "and we stayed six months. We did a tremendous business. We were the talk of that country for years after that time.

"It was pretty soft for us. The rich Mexicans and the ranchers and even the Negroes had more money than they knew what to do with. We charged a dollar admission, and it was cheap country to travel across. There were no licenses. Hay was a dollar a ton, and other food costs in proportion.

"But the hotel keepers tried to gouge us every once in a while. You know, in those days we didn't have a camp on the lot where we fed our people; everybody, including the workingmen, was put up at the little hotels.

"In the mornings, after the show had left the town, pa used to pay the bills, because he didn't know what they would be until everything belonging to the show had cleared out. This morning, he had some argument with the hotel proprietor about the amount of the bill. What it was about, now, I don't remember.

"We had a carryall that we rode in, my father, mother, younger brother, sister and myself. I rode in front with my father, and the rest of them sat on the back seat. We had a very spirited pair of bay mares, thoroughbreds, and the team stood hitched right in front of the hotel.

"We were sitting there, waiting for pa to pay the bill and come out so we could start. All of a sudden he came out rearing and tearing, and the landlord behind him. Pa jumped into the carryall, took up the reins, and slapped the horses on the back with them. They gave a jump, and we were off.

And Away They Went

"RIGHT in front of us was a little ditch, and the front wheels went down in it. As they came out of the ditch the back of the carryall flew up, and the kingbolt—there was no pin in it—came out of the fifth-wheel, letting the whole thing fall down on the ground. The horses kept going, and pa went down the street hanging on to the reins, plowing up the dust, and everything else in the sand. I went over the dashboard, and my mother, brother and sister over on top of me.

"We all jumped up as quickly as we could, grabbed the body of the carryall, and lifted it up and out of the road. In the meantime, pa got the team stopped, turned them around, and drove them back. There was nothing broken, and we were not injured. Mother and I lifted the body of the vehicle, pushed the wheels and axle under it, and let it down. We hitched the team again—the whole occurrence didn't take more than a minute—and started down the street as fast as the horses could take us.

"We were about two or three miles out on the prairie, when pa looked back and saw a cloud of dust. He surmised what it was, and slowed up. Then three fellows caught up with us. One of them was the sheriff. They circled around us, and one fellow demanded of pa to stop, and another one told him to surrender. Pa paid no attention to them, but kept the team trotting. Every time one of these fellows would reach from his horse and try to catch the reins pa would tell him not to touch them, and he would jerk the reins out of reach.

"After a while they got tired of this, and began to get braver.

"'If you fellows don't get away from here,' pa finally said, 'I'll kill the whole gang of you.

"'Elizabeth, give me that pistol,' he said, turning to mother.

Off Gallops the Posse

"SHE had brought a bag of doughnuts with her, and she and my brother and sister were eating them. Pa grabbed the longest doughnut, and brought it down as though he was going to shoot the sheriff. The three fellows turned their horses around, and galloped out of range. Then pa jumped out of the carryall, and held the doughnut pistol on them for a while; then he motioned for them to come back. When they did, he told them that he'd paid the hotel keeper what he thought was right for what he gave us, and he wouldn't pay any more. But he did want a receipted bill for what he had paid. The sheriff receipted the bill, and this is the bill. Mother never had any appetite for doughnuts after that time.

"I wonder how I ever went through the hardships of the early days with the old wagon circus," the "Governor" went on, after scrutinizing a bill for supplies purchased in Thomasville, Georgia, long before the war between the states.

"The night before we showed this time in Thomasville, we were going along the road, when a norther struck us full in the face. The horses soon got tired of facing the rain and the sleet, and they turned around in the road—they simply wouldn't face the storm. We were near a schoolhouse, and there was still some fire in the fireplace, so we went in and built it up again. The first thing we knew the whole building was afire, and everybody, horses and people, gathered around it while it burned. It was a funny sight, I can tell you.

"A few days later, we had another cold snap, one that froze ice a quarter of an inch thick. I was riding with pa one morning about daylight, when we caught up with the baggage wagons and the cages. They were stopped, and the men were standing around little fires that they had started. When we got out of the rig, we found that the road led through a swamp where there always was from a few inches to two feet of water—there were many roads of that kind in the South in those days—and this water had frozen until there was probably half a mile of ice through which it was impossible to get the horses to go. They would balk rather than make the attempt.

"Pa didn't delay. He took the horse that was ridden by the man who led the elephant, and grabbing a fence rail, he started to break a road through that half mile of ice. The horse balked after he started, so pa jumped off, and let it go back to the group around the fires. Then he waded through the swamp, cracking the ice with the rail the whole distance. Then he came back, making an open way for the baggage wagons to get through. He was soaking wet, and nearly frozen, so we stopped one of the baggage wagons, got out his trunk, and helped him to put on dry clothes in that bitter cold. He never suffered from any bad effects, however.

"During that same season we were having a lot of trouble with one of the wagons. It seemed to be always in trouble. It was a four-horse load, and it finally wound up by being pulled by eight horses, but still they were always balking and stalling and in trouble.

"One day we met a mule drover with a bunch of mules, and pa bought four of the finest ones there were in the lot. They were matched, about eighteen hands high, and weighed in proportion. They were fresh and young, and when they were hitched to that load it was like pulling a sulky to them.

"Going from Cuthbert, Georgia, to Eufala, Alabama, we had to cross a swamp. The road through it was corduroy—logs laid down, you know. I was very anxious to see that mule team bring the load through the swamp, where the wheels went down to their hubs between the logs, and then they would jump up and down, which made it very trying on the team. So I got in front of them with my buggy where I could see what they were doing. The logs of the corduroy were pegged down on each side to prevent them from floating away when the water got high enough to run over the embankment.

Down Went the Mule

"I WAS wearing a very fine overcoat, lined with the finest of furs. The coat had a big heavy cape on it. The collar came high up around my neck, and the coat itself reached to my ankles. I had on a pair of high top boots that came to my knees. All of a sudden, one of the lead mules coming along over these logs went down into a hole between a couple of saplings, and fell. Now there is nothing in the world that will give up so quick as a mule in cold water, and this mule was no exception. His head went under the water.

"I was afraid he would drown, so I jumped out of the buggy and ran to him. The water was running over the top of the road, but I held the mule's head up. He commenced to struggle with me hanging to him, and all of a sudden he gave a little twist, and threw me over this embankment. My heels caught on the log, and I went down into deep water head foremost, big coat, heavy boots, and all. It seemed to me I was under that water for an hour or more—it couldn't have been very many seconds—when one or two of the men ran over and got me out. But I got soaking wet, and after that I had to ride twenty-five miles in an open buggy in the snow and the sleet that started to come down a little while after we got out of the swamp. When I got to the town and tried to get out of the buggy I was frozen fast to it, and they had to chop me loose from the cushions.

"However, one of our greatest annoyances and troubles with the old wagon show," the "Governor" went on, "were the ferries and the tollgates. I remember one time in Kentucky, there was a country storekeeper at a crossroads, and he stopped me. He wanted to know if I didn't want to make a little money. I told him I did. He said that if I left the road there, and went down the side of the mountain, and around through a valley, then up another road that I wouldn't have to go more than half a mile

(Concluded on page 15)

Zona Gale and "Friendship Village" Stories

"TAKE the River Road street and go up five blocks until you come to the oddest looking house in the community. It's on the river bank. You can't miss it. No one but a writer, or some person like, that would want such a queer looking place."

This was the direction which the clerk at the hotel in Portage, Wisconsin, gave me when I asked for information regarding the home of Miss Zona Gale, author of nearly a dozen books and whose recent production, "Miss Lulu Bett," has New York contemporaries predicting that the literary center of the Middle West may be moved from Indiana to Wisconsin.

Zona Gale has put the life of the small village into American literature. With penetrating insight, and humorous, sympathetic observations—of places where no newspapers are needed, but every person knows what the other is doing—Miss Gale has pictured town life in this country in her "Friendship Village" stories. And now she has come into the limelight as a playwright. Her dramatization of her novel "Miss Lulu Bett" is hailed as one of the important events of the season, dramatically speaking.

The ordinary everyday affairs of the common people of this country have been made so realistic by her pen, that American landscapes and American scenes may in the future play a more important rôle in literature and interest will attach to these places with the aroma of mysticism and the romantic.

"Writers of Europe have thrown a beautiful texture over the hills of their various lands and made them famous," declares Sinclair Lewis, the author of "Main Street," recently. "It will be the same with the hills of Wisconsin and Zona Gale will make it so."

Portage, Wisconsin, is different in one principal particular from the hundreds of other cities of the United States with a population of about 6,000. Around about is a wealth of historical associations that as yet have found no place in Miss Gale's productions. She is not a writer of historical novels, but her themes picture with discerning insight the life of today—not yesterday. Portage is picturesque in its historical settings. It crests the ridge of land that separates the raindrops that shall flow either to the Mississippi and the Gulf of Mexico, or through the Fox River to find its outlet into the Great Lakes, the St. Lawrence system to the Atlantic Ocean.

Three centuries ago this two-mile divide was the gateway to the West. Over the very scene where the home of Miss Gale has been reared came explorers, the priests, traders and courtiers—a galaxy of important personages. Father Marquette and Joliet dragged their frail crafts across this isthmus of land on their way to discover the Mississippi River in 1673. Duluth and Hennepin came on the scene in 1680 as the first explorers from the West. Nicholas Perrot, the Baron Lahontan, Charles Pierre Le Sueur were among the famous travelers to describe the Portage in the seventeenth century. But history has not engaged Miss Gale in her writings.

"I cannot touch a fact and weave it into a story," Miss Gale explained when I called her attention to these historic matters, "my people come from an imagination of present-day experiences. Portage is rich in historical interests of the early fur-trading days, the days when Marquette and Joliet first crossed the Portage with canoes; and Indian days, when Red Bird and Yellow Thunder and the Winnebagoes paddled down the Wisconsin and Fox rivers and camped in the Caledonia hills; and days of the old Fort Winnebago, which was the first settlement of the town, where the young Lieutenant Jefferson Davis was for some time stationed, when mahogany and pianos came up the Fox River on barges for the homes of the officers. But it has never crossed my mind as a purpose, to try to write about all this. The only thing in which I am interested in writing about, is life as I see people trying to live it. The human experience, the common human problem, has just as vivid a setting in a little western town as in a fort or a court."

Literary success did not come at the outset. For ten years Miss Gale received the little blue rejection slips from publishers. But she was never discouraged. She clung as tenaciously to literary work as the Selkirk Glaciers of Canada cling to the terminal moraine. She had confidence in herself which is perhaps a more compensating attribute than the rewards from immediate achievement.

"The first story which I ever wrote was printed," said Miss Gale half humorously as she discussed her literary work, gazing out across the expanse of the Wisconsin River which flows through her back door yard. "I printed it myself in pencil for it was before I could write. And the story appeared in a book. I made the book of Manila paper bound with a ribbon. The story began: 'The sun was just sinking behind the hills when three travelers appeared. One was tall; one was short and one was middle-sized.' And when the heroine arrived and one of these travelers had asked her to marry him, I remember pressing my mother how to spell 'N—Yes,' which constituted the maid's reply."

There were other early trials at writing. Little verses in blank books and little novelettes with characters which Miss Gale has long since forgotten. Attending the public schools at Portage, her birthplace, in 1874; the Wayland Academy of Beaver Dam, and later the University of Wisconsin where she received her Bachelor's degree in literature in 1895 and a Master's degree four years later, she continued her barrage of literary effusions upon unsympathetic editors.

"A short story I first submitted at sixteen—it was called "Both"—was 3,000 words long and I was paid $3 for it by the Milwaukee *Evening Wisconsin*," continued Miss Gale in telling of her first literary tribulations. "I had just entered the University of Wisconsin, 40 miles from home, but I traveled 40 miles to show the check to my mother and went back in two hours. Excepting in the Milwaukee and Madison and Wisconsin University newspapers, and one or two magazines, I never had a story accepted until 1903. In 1911 the *Delineator* gave me a first prize of $2,000 for a short story, 'The Ancient Dawn.'"

"I began newspaper work on the Milwaukee *Evening Wisconsin* which accepted that first story of mine, and I secured a position by attrition," explained Miss Gale, speaking of her work back in 1898. "I presented myself at the desk of the city editor each morning but with the intense wish that the elevator which took me up would turn out to be the elevator taking me down again. At the end of two weeks the city editor let me write about a flower show. I have never put such emotion into anything else that I have written. I was another month in getting on the staff."

Feeling that a broader field of opportunity was beckoning her, Miss Gale went to New York in 1901, to be refused a position on nearly every paper and then she went back to the New York *World* to persist—as she has always persisted—until success should come. Every morning she made out a list of suggestions for stories that she might write that day. Finally the editor placed her on an assignment and then another—then on the regular staff.

Did Miss Gale take her trials and disappointments to heart? Not for an instant.

"All of this was so largely sheer adventure and pioneering that none of it now seems to me to have been either will or purpose, but pure delight," came the writer's reply. During her early work she had written many verses. Now she began to write short stories for magazines and later these short stories were printed into books—"Friendship Village," "Friendship Village Love Stories," "Neighborhood Stories," "Birth" and a number of others.

"Romance Island" was one of her first books, published in 1906. Miss Gale was already beginning to attract the attention of publishers. Her ingenuity, her persistency, her versatility were forcing recognition.

"The amount of work which she turned out daily was astonishing even to veteran journalists," said a book reviewer in a comment in 1907, "and it was known that she was able to write in the most difficult circumstances, on the Stock Exchange, in crowded trains, in ferry boats—in fact, anywhere. On one occasion Miss Gale went to call upon the editor of a prominent magazine, who had requested an article from her. He was busy, and unable to see her for a half hour: but the young author determined to utilize so valuable a period of her busy day by writing the article while she sat in the entry. Though typewriters were clicking all around her and telephones were buzzing, she managed to turn out a two-thousand-word essay, which the editor has declared is in some respects the best bit of work she ever did."

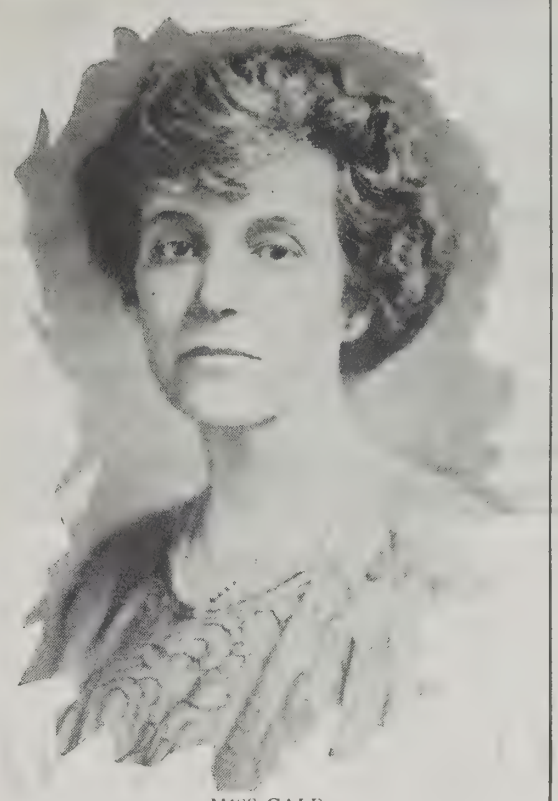
Gradually Miss Gale has given up her work as a reporter to become a short story contributor to practically all of the monthly magazines and to become a writer of novels and plays. In recent years most of her literary work has been done at her home in Portage. Living in a household as quiet as it is replete with domestic simplicity, surrounded by her aged father and mother she pursues her literary activities.

The Zona Gale home at Portage is not an oddity as the hotel clerk described it to be, but a simple colonial structure with two big white pillars in the entrance which distinctly marks its architecture from the surrounding residences. Perched high on the river bank where below the waters eddy and flow, with cool summer breezes and scenes of nature all about, the inspiration for literary pursuit engrosses. On the second floor of her home a room has been set aside where all of her stories are first penciled in long hand and then laboriously transcribed by her on her own typewriter. Then they are laid aside for two weeks before they are taken up for final revision.

Many things interest Miss Gale. Little wonder that she should be touched to action by a love for village life and with a delineation of its characters. But she has devoted herself not alone to literature. She has taken an active interest in civic improvements. She has been president of the Civic Association of Portage, chairman of the State Federation's Civic Work, of the National Civic Work of the General Federation of Women's Clubs, on the board of the American Civic Association, member executive committee of the American Union Against Militarism; of the executive committee of the Women's International League for Peace and Freedom; member of the Women's Peace Society founded by Mrs. Henry Villard; and of the Fellowship of Reconciliation.

Since she descended from old colonial families, with English ancestors, the carpings of those who criticise her anti-militaristic policy cannot be made on nationality grounds. Her mother's family settled in Watertown, Massachusetts, in 1640—twenty years after the Mayflower landing. Her great-great-grandfather, Captain Henry Gale (it was then spelled Gael) led his company against the courthouse at Worcester in the Shay Rebellion to demand the repeal of the imprisonment-for-debt law. When he was captured he was sentenced to death, reprieved and moved to Vermont to make his home. Miss Gale comes naturally by her instinctive love for reform and freedom. The ancestral characteristics have been engrained in her bones.

She speaks out against the military program of the day; demands better living conditions; freedom from the powers that prey on the weak and the poor, and is insistent in her demand of amnesty for political prisoners. She quoted me a phrase from Victor Hugo favoring amnesty to show that the leaders in literature far back had espoused this doctrine.



"Other civilized nations have released their political prisoners," declared Miss Gale, "and the United States should follow. At this moment there is no patriotic work whatever which so strongly enlists my sympathy as the work toward general amnesty for all political prisoners. This is patriotic work because of our own Revolutionary and Civil wars reconstruction tradition; and because of our pride that our own nation shall not be any further behind the other nations than it already is, in this matter. But it is patriotic most of all because amnesty is a democratic concept. Above these things it is the civilized and the Christian concept."

Little characteristics of manner in Miss Gale's nature have endeared her to her friends. With considerable pride the young editor of one of the large agricultural papers of the country, who as a boy had lived at Portage, told me of his first childlike impression of her. It was a holiday and the people had lined up in front of the post office to get the mail. He had been pushed out of line by his elders many times, but when he stepped aside for Miss Gale to proceed, she said: "You're first." That simple courtesy to a boy has endeared her more to him than a gift from others.

Frail of body, a picture of delicacy and daintiness, Miss Gale is waging a battle for higher ideals of Americanism. In her books are to be found the rough, unpolished, but thoroughly sincere westerner; women of sweetness, charming in simplicity and ideals; characterizations of modern business life—real American people that stand out boldly in their faith. She has lifted the American up to the mirror to gaze upon himself.

"The earth ain't so full of the fullness thereof, but that we can all do something to make it a little more so," is a saying from Calliope March, the leading character in several of her earlier books.

This seems to be the ideal that Miss Gale has planted as her life's goal. This is her gospel.

MISS GALE

"Friendship Village"

By ZONA GALE

WE ARE one long street, rambling from sun to sun, inheriting traits of the parent country road which we unite. And we are cross streets, members of the same family, properly imitative, proving our ancestorship in a primeval genius for trees, or bursting out in inexplicable weaknesses of Court House, Engine House, Town Hall and Telephone Office. Ultimately our stock dwindled out in a slaughterhouse and a few detached houses of milkmen. The cemetery is delicately put behind them, under a hill. There is nothing medieval in all this, one would say. But then see how we wear our rue:

When one of us telephones, she will scrupulously ask for the number, for it says so at the top of every page. "Give me 1-1," she will put it, with an impersonality as fine as if she were calling for four figures. And central will answer:

"Well, I just saw Mis' Holcomb go 'crost the street. I'll call you, if you want, when she comes back."

Or, "I don't think you better ring the Helman's just now. They were awake 'most all night with one o' Mis' Helman's attacks."

Or, "Doctor June's invited to Mis' Syke's for tea. Shall I give him to you there?"—From "Friendship Village."

Our "Acres of Diamonds"

Concluded from page 3

United States Government scientists in the wilds.

is scarcely a line in their reports bearing on their personal adventures. This, despite the fact that their wanderings in Alaska have been more extensive and adventurous than those of all other explorers who have written about the Arctic.

Another job cared for by the Survey is that of checking up on the worth-while streams of the country. This is of great importance, for water power cannot well be developed until it is first accurately measured. Any one capable of working a simple sum in arithmetic may measure the flow of a river—if you don't know, the Survey will gladly tell you how; but it takes years of observation and record-keeping to show what flow may be depended on at different periods during the year and for future years, the flow of a stream fluctuating with the years as well as with the seasons.

The statistical work includes figures in detail on domestic output and foreign influx of all the minerals. These are issued in book form at the end of each year.

The Survey is now issuing a world atlas of commercial geology. It is based on data collated for the American representatives at the Peace Conference.

"Experience gained during the war," says a Survey publication with reference to this world atlas, the first volume of which is now being circulated, "emphasizes the advantage of an adequate supply of raw materials close at hand. Yet there are certain economic limits to domestic independence in raw materials, as shown by readjustments already made. The more facts we possess bearing upon the relative quantity and the relative availability of the mineral resources of our own and other countries, the better able will be our captains of industry to decide whence they may advantageously derive their raw material." We import as well as export large quantities of minerals, and the imports are not confined to those not found in our own mines. Certain minerals that we possess in large quantities, like manganese, are liberally imported because of cheaper labor or richer veins in other countries, or because transportation favors importation.

The great desideratum of the Geological Survey is to be able to give accurate advice about minerals.

Every little while somebody sends in for examination by Survey experts what appears (to the sender) to be a diamond. Usually the specimen is simply white quartz. While actual diamonds are mined in Arkansas on a small scale, North American geological strata do not include the famous "blue clay" in which diamonds are found in large quantities in Africa.

It may be asked, can the government's geologists pass on the promise of a gold or oil mine as they can on the quality of a supposed precious stone?

Yes and no.

They cannot tell what a specific mine-shaft or a "hole in the ground" will yield, but they can nearly always tell what it will not yield. Like the precious metals and petroleum, mineral-bearing ores go along with certain kinds of earth-strata as studied and diagramed for the country by the Survey. Thus it may be told with some certainty whether or not there is a prospect of finding oil or gold or silver in any particular area.

One of the big functions of the Survey is to give manufacturers correct information regarding the whereabouts and potentialities of various domestic mineral materials. This was a great help during the war when drastic readjustments had to be made in our industries. Another function is to promote conservation in the use of mineral wealth. It is estimated that only 76 of every 2,000 pounds of coal used in industry is turned into mechanical power. Much of the balance is left in the ground in a way that makes future recovery impossible, a great deal is wasted in transporting the coal to manufacturing plants and much more is wasted through imperfect use at the plant. For, though we have more mineral wealth than any other country, we have none to waste. It is as much the property of our grandchildren as ours.

But the great function of the Survey is to lend assistance in raising the mining and the mineral industries to the level of stability that their importance demands.

"Kinertia" Versus Einstein

Continued from page 2

It will be particularly interesting to compare the conclusions of the two men concerning the nature of the path of the earth's motion in space.

Eddington.

"Consider, for example, two events in space-time, namely, the position of the earth at the present moment, and its position a hundred years ago. Call these events P^2 and P^1. In the interim the earth (being undisturbed by impacts) has moved so as to take the longest possible track from P^1 to P^2—or, if we prefer, so as to take the longest possible proper-time over the journey. In the weird geometry of the part of space-time through which it passes (a geometry which is no doubt associated in some way with our perception of the existence of a massive body, the sun) this longest track is a *spiral*—a circle in space drawn out into a spiral by continuous displacement in time. Any other course would have had a shorter interval-length."—("Space, Time and Gravitation," page 72.)

Wilson.

"Draw from the sun perpendicular to the plane of the earth's orbit a line which shall represent the time-axis and disregard the third spatial dimension. Now for each kilometer that the earth moves around in its orbit, it must be considered to move in time by 10,000 kilometers. The path of the earth in space and time on this diagram is therefore a *helix* with an extremely steep pitch winding once a year about the cylinder standing in the earth's orbit but advancing ten thousand billion kilometers while "circulating" one billion kilometers."—("Space, Time and Gravitation." The *Scientific Monthly*, March, 1920, page 227.)

"Kinertia."

"The possible motion of the sun in space, as adrift with the planets, was anticipated by Newton; but the laws of motion prevented him from reaching the true *corkscrew* path of the planets in space as they revolve round the sun."—("Do Bodies Fall?" *Harper's Weekly*, September 19, 1914, page 285.)

In this connection we submit as corroborative evidence of the highest import, the illustration of this *corkscrew* path of the earth and moon which was used to elucidate "Kinertia's" article in *Harper's Weekly*, September 19, 1914, page 285.

This illustration, taken in conjunction with "Kinertia's" statement, quoted above, proves conclusively that the unknown "Kinertia" derived the same type of path for the earth's motion in space that Einstein claims as his original contribution.

We introduce the following final quotation in order definitely to fix the date of "Kinertia's" contribution:

"Kinertia."

"This statement is concerning a discovery in natural science and the ordinary phenomena of daily life, which I discovered about fifteen years ago while engaged in carrying on some experiments to verify what I had previously suspected to be the true physical cause of *Elasticity, Gravity, Weight and Energy.*"—("Do Bodies Fall?" *Harper's Weekly*, August 29, 1914, page 210.)

Since this article bears the date 1914, it is clear that the year 1899, fifteen years earlier, is the date which can safely be regarded as the birth-year of "Kinertia's" theory of gravitation. We have seen that Einstein's first work on gravitation was done in the year 1911; consequently "Kinertia" antedates Einstein by twelve years.

We rest the case of "Kinertia" Versus Einstein on the evidence submitted in this article. If Einstein was aware of "Kinertia's" discovery then the appellation "plagiarist," bestowed upon him by his German professional colleagues, is eminently fitting. If, on the contrary, Einstein was unaware of this work, then he is, nevertheless, antedated by the work of "Kinertia." Einstein is at liberty to choose either horn of the dilemma.

The Democracy of Durham

Concluded from page 7

ments amounting to less than the rent of a house in town. Like the regulation farms, too, they were laid out with due regard to their purpose, being located on soil well adapted to gardening. While small, consisting of from two to four acres, they provide employment for the owner's spare time, and enable him to produce the bulk of the family's food.

One of the laborers last year sold products from his garden to the value of $450, in addition to working every week day for the farmers of the community. Besides this, his little place yielded the feed for a cow and all the green stuff required for a hundred hens. Even then all the vegetables that he raised were not utilized. Since, steps have been taken to organize an association of the laborers at Durham to facilitate the marketing of the produce that remains after the home needs are filled.

Not the least of the virtues of the Durham plan is that it gives the laborer an acknowledged place in the community. As Doctor Mead pointed out in the last annual report of the board, the American laborer will not live in a bunk house. "He will not stay on the land," Doctor Mead said, "if he has to compete with Asiatics, and he will not bring up his family where his wife and children have no social status. These things do not reflect on his industry and character. On the contrary, they show the strength of economic democracy in the American soul."

By the simple expedient of making every person in the settlement a home owner, this community has bridged the gulf that separates the different classes of rural society. Herein is the democracy of Durham.

When the settlers were erecting their homes, the state helped them to organize their purchases of building materials into carload shipments. In this way they obtained these materials at wholesale prices, with the result that, considering also the labor which the settlers themselves performed, many of their houses cost less than half what would have been the case with each settler buying individually. This was the beginning of co-operative effort among the settlers at Durham, a phase of the community's life which contributes largely to its success.

Collective purchasing since has extended to a number of farm supplies, it proving especially advantageous in obtaining a carload of purebred dairy cattle. Later, dairying having become one of the settlement's main industries, a central cream-skimming station was established, the farmers pooling their product and thus obtaining better prices for it.

A live stock breeders' association was formed, of which every farmer in the community is a member. By voluntary agreement this organization has limited the live stock breeding operations of the settlement to one breed, in the case of beef cattle, dairy cattle and swine, and to two breeds of sheep; thus giving direction to the community's purebred activities and effecting economies in procuring superior breeding stock.

The social life of Durham revolves about the community park, a tree-covered tract of twenty-two acres, which was set aside as a civic center and gathering place for the settlers. Here is located a spacious club house, at which the meetings referred to are held. There is also a dancing pavilion where, from April to October each year, are weekly dances, young and old, employed and employer, meeting here on equal terms and in the common bond of home ownership.

"The state is giving away nothing but an opportunity to become a home owner and a valuable citizen," Doctor Mead said while on a recent visit to Kansas, where the California plan is being earnestly considered. "The Durham project is now three years old and instead of costing the state money, the board could turn back to the state a profit of $180,000 over the interest already paid the state for the use of its capital. The board, however, instead of paying this money back to the state, will use it for additional community improvements, starting with a large community swimming pool."

Encouraged by the success at Durham, California has established a second and larger project along the same lines at Delhi, in the southern part of the state; the legislature in 1919 appropriated a million dollars for the extension of the land settlement work. The Delhi project comprises 8,561 acres. In the raw, this tract cost the state $809,331.47, one-third of which was paid shortly after the land was purchased.

While, in general, the Delhi plan is the same as that of Durham, the average farm in the second settlement is smaller than in the Sacramento Valley project. This is due to the fact that the Delhi settlement is in a district noted for raisin and melon growing and peach and apricot orchards, wherefore very intensive culture is required. The settler at Delhi also has thirty-six years, instead of twenty, in which to pay for his land; his means that, besides the interest, he must pay off but one per cent of the principal yearly.

In the two settlements, California has established, since May, 1918, more than 300 homes, under conditions that mark new standards of democracy in the rural life of America. What these homes mean can be expressed no better than in the simple language of one of the farm laborers paying his semi-annual installments on a plot of three acres at Durham, who was asked why he did not sell out.

"Where can I go to beat it?" countered the laborer. "Here I have my own home, my cow, my garden and some chickens. We have plenty to eat and there are plenty of jobs at fair wages. I have as much to say in community affairs as any citizen. The schools are excellent, and we are happy and contented and busy. Why should I sell out?"

Meaningful words are these—the tribute of the man on the ground to a rural life that satisfies.

"Cutting Up Old Circus Money"

Concluded from page 12

farther, and could escape a tollgate. That would save me from fifty to a hundred dollars toll.

"I thanked the fellow very much, and started the wagons down this other road. This fellow had a very nice store, with stanchions supporting a wooden awning in front of it. The stanchions were made of six-inch boards put together to make a square column. After all the wagons had gone by I started to leave. Then the storekeeper insinuated that as he thought he had saved me some money, he ought to be remunerated.

"Well, at first, that struck me as funny, but I thought he was about right. So I asked him what he thought he ought to have.

"'Oh, probably fifty dollars, or a hundred tickets to the show,' he said.

Shotgun vs. Knife

"OF COURSE, I couldn't stand for that, and the argument became fast and furious. In the excitement of it he went into his store two or three times, and shifted the position of his shotgun. That was done to intimidate me, I knew. So I took out my knife, and commenced talking fast. I was excited, and so was he, and after awhile I discovered that I had been whittling one of the stanchions until I had it cut about half in two—the four planks were nailed together, you know, in the form of a box. There was a chance for a damage suit, but he was so excited that he didn't notice what I had done. I started to get down off of the porch, and every second I expected to get shot in the back.

"I got in my buggy, and when I saw he wasn't going to shoot, I settled with him for ten dollars.

"In 1868 we crossed the Red Sea Swamps. They are in the Mississippi bottoms opposite Memphis. We had traveled all the preceding summer and winter, and that summer late into the fall—about twenty-two months—and never missed a stand. I was ambitious to keep up the record. Such a thing never had happened before in circus history, and I would do almost anything to keep the record unbroken.

"When we started from the Memphis side to drive through the swamps, we found that there had been three or four heavy summer thunder showers through there, and the result was that in a distance of forty miles I don't think there was a mile of dry road. There was anywhere from an inch to three or four feet of mud and water all over that road. We drove from Memphis to Marion, a distance of nine miles, and gave the afternoon show. Then we started to go to Wittsburg, thirty-five miles away, through this swamp. In four or five miles I discovered that the horses were getting fagged very fast in the hot sun and mud. When night came we had made very little progress.

"We stopped at a little log hut where a white man lived with four or five wives—he was a typical Arkansas traveler—and he let us have all the water we wanted at twenty-five cents a bucket. There wasn't a particle of ground in sight—it was all covered with water, yet none of it was fit to drink, as it was muddy swamp water. There were no streams, and the water laid flat, in pools. It wasn't very long before this fellow's well ran dry.

"We laid over there, and got an early start next morning. Now, this man was supposed to be very sick with the breakbone fever. Yet, after we left he got on his mule and followed us some ten or fifteen miles, because he said he had forgotten to count two buckets of water, which amounted to fifty cents. When he caught up with us we got out our pencils and sharpened them, and began to figure with him. We showed him that he had been overpaid, and he didn't get the fifty cents, after all that hot ride, with the dango fever worrying him.

"He tried to collect the money at a place where we were crossing a slough. A farmer there had heard that the circus was coming his way, and he built a log bridge for our benefit. He was laying there for us with a lot of his good friends to help him for a couple of days before we got there. Then he wanted to collect toll. My recollection is that his charges were about five dollars for a four-horse wagon, and a dollar for each foot passenger. Anyhow, his bill was something like a couple of hundred dollars.

"The bridge was nothing but a lot of logs laid on some sleepers. They were not even hewed down level, and the horses and wagons slipped and slid everywhere—some of them slid pretty nearly off into the slough—and it would have been a great deal better for us if he had let us go through in our own way. But he didn't get more than ten per cent of what he asked for. He was daffy on perpetual motion, and some of my men got in conversation with him on the subject, and got him so rattled that he settled for twenty dollars.

Loses Day on Engagements

"WHEN the second night came we still were some four or five miles away, and that is the day I should have been in Wittsburg, so my record was broken. I sent one of my men with my horse and buggy into Wittsburg to get some provisions and feed sent out for the people and horses, as they had been all day without anything to eat. When he got near to Wittsburg he found the St. Francis River was between him and the town, and it was dark, no one around, and the river was rather narrow. He didn't know there was a ferry there. In fact, he didn't know the geography of the country, not even that there was such a river as the St. Francis. He supposed it was a creek, so he drove the horse into it. The first thing he knew the horse was swimming, and the buggy was floating. That horse swam probably a hundred yards, and he landed on the other side without an accident, which I consider a remarkable performance. Not a thing was lost out of the buggy.

"Well, he got the feed and stuff back to us, and we got a pretty early start the next morning. By that time the roads had dried up pretty well, but still I was a day behind my dates. I should have been at Forest City, and there I was at Wittsburg, twenty-five miles away. I took a piece of side canvas, and made a corral from tree to tree across the road. The people who came there the day before to see the show remained overnight to wait for us, and I charged them a dollar apiece to get inside of the corral. As the cages came over the ferry they were driven right into the inclosure. We took the doors off the cages, cleaned them, fed the animals, and by that time another load would be over. While we were cleaning the cages the people in the inclosure looked at the animals, and that was all the performance there was. When the animals were fed, we put up the doors, and the cage drove out the other side, and on to Forest City. On my books I have the day's business at Wittsburg, but I didn't do the business there on the day it should have been done. I was a day behind. But I got about three hundred dollars there, so that I feel that I didn't lose the record. I have something to show for the stand.

"Fortunately, at Wittsburg we got on the hills and bluffs. I managed to get the show to Forest City about sundown, and put up the tents. We had a tremendous night house. The next day was Sunday, and I caught up with my dates, and got around a very serious problem.

"The drive to the next stand was a short one—not over twelve miles—and as the day was Sunday I didn't leave Forest City until after dinner. I calculated to get in the next town before dark, and I thought that would give the horses a good night's rest. We left, and in a short distance got into a kind of a low, flat country, not exactly swamps. In a very short time I discovered that our horses were being attacked by buffalo gnats and flies—horseflies, larger than any I ever had seen, the kind that have been known to kill a horse in half an hour by sucking the blood right out of him.

"Well, they were so thick on my horses, and they came so suddenly and so many of them, that the horses fairly were dripping blood. I had the men get out of the wagons and cut bushes and stick them into the buckles and loops of the harness, and then the men walked alongside the horses and whipped them with brushes to keep the flies away. In that way we managed to get through the place, which was probably a mile long. If I had put off taking these precautions a very few minutes I probably would have had some of my horses killed."

This is one of several stories by Mr. Barnet, on early circus life. The next will appear in an early issue.

MOLLY BROWN,

The first lady rider to turn a clean-cut somersault on a bareback running horse, in 1874.

Government Helplessness in Foreign Trade

Concluded from page 6

Middle West. By that I mean practically all the states west of Pennsylvania and east of Colorado.

It seems to me that more imaginative instinct accompanies the Middle West pioneer in agriculture and commerce than in the immediate East. The East is set in its ways and commercially its grooves are like the bed of a river; hardly changeable. Certainly nothing in two years shows that the eastern interests have done very much to uphold American supremacy abroad, not if one compares their relative position at home. Moreover, it is well to bear in mind that much activity credited to the East does not rightfully belong there, because New York City or Boston or Philadelphia is merely the seat of general offices of interests inland.

Foreign trade means co-operation with foreign customers and dealers too, and as a result something more than mere banking representation or an agency in a commercial center is required for successful expansion. It is probable that in another generation there will be a crop of young business men who have talent for foreign service. This generation has none, not in this country. The few experts there were have been gobbled up and are doing duty abroad for the houses fortunate enough to be so ably represented. Against that, there are the houses who are represented by impossible men, whose selection for their posts is a serious reflection on the appointive powers that be at home.

Is Costing Firm a Fortune

I KNOW of one case of a man who five years ago was a clerk and then became an examiner of foreign offices. In an emergency he was made manager of an office abroad upon the sudden transfer of the former director. He does not speak the language of the country to which he was accredited, spent most of his time in the club playing games, and happened to carry along merely because the men back home are no better informed than he. It is costing the main office something like a hundred thousand dollars a year to carry the branch—to say nothing of other losses, which in one case in a single transaction amounted to more than another $100,000 and legal expenses—all of which is doing American business as a whole a great deal of harm.

I was in this office one day when one of the most prominent capitalists of the country called in regard to a loan. Imagine a gray-haired man, forty years an expert in international finance and banking, whose word was better than a bond with British and German financiers before the war, having to be patronized by an individual whose only claim to attention was the fact that he could recommend or refuse the loan, just because the United States happened to have the dollars sought by the manufacturer. That borrower went to a British bank around the corner to get his loan which he secured in 24 hours. I am afraid it would be very difficult to do business with that man, now, unless a more representative and sincere American acted.

Another went to Paris, to take charge of an office. It is supposedly an international body. So far as I know he has been a professor all his life, except for the time he served in a charitable organization and later with the government. On the eve of his departure he mapped out a program that involves nothing less than a miracle—and a millennium. His nine points included every one of the government's activities; diplomatic, commercial, financial and so on. Only one point was and is his distinct province; that of a more uniform business procedure among foreign traders.

Exchange Not Handicap

REGARDLESS of adverse exchange, which operates with limitations, there is enough spending money in the rest of the world to satisfy American business, and then some. If you have the article get the man to popularize it. It may be done directly, it may be done by joint agreement with local manufacturers abroad, so as to avoid prohibitory laws or clear high tariffs, or by special arrangement.

Beware, however, of extravagant Americanisms, as they call them in Europe, and avoid ostentation. It is not necessary to indulge in entertainment. The quietest of visits, with all formality and ease dear to the old-fashioned heart, paid by a man who actually knows his ground and his hosts, will perform wonders. It has been known in one case to invite the repeal of a law which would interfere with such business.

The point, in other words, is to forget that the mere favorable (but disadvantageous) balance of trade and its ostensible billions of extra dollars is in action. The foreigner has been doing without many things for seven years and might manage, for the sake of his pride, to extend it indefinitely. It is not the loan that he wants, but something that, in co-operation with America, will enable him to deal freely here. That is a thing to be accomplished only by the right men, who have enough discretion to be pliant without actually playing into the hands of any one needlessly.

The manufacturer who wants to do business abroad had better act for himself. To depend upon associations for the promotion of foreign trade is really lost time.

Briefly Told

A discovery of cipher manuscripts of Roger Bacon indicates that the people of that time were not unfamiliar with the use of telescopes and high-powered microscopes.

To produce the body of a murdered man in court as evidence, a Canadian Northwest Mounted Police officer "mushed" by dog team four hundred miles south to the nearest justice's court on the Slave River producing the body at the trial of the murderer who was captured deep in the northwest wilderness.

A prisoner in St. Paul, Minnesota, paid in full five victims of his forgery. Earning but twenty-five cents daily in the prison twine plant he managed to save the $43 which he paid to ease his conscience.

An engineer and fireman on a transcontinental train left their engine recently to rescue from a burning farmhouse near Cochrane, Ontario, an invalid mother and her son. The boy jumped from the second story into their arms.

Chicago police will use wireless telephones in their war on crime. A wireless is being installed on the roof of the city hall for constant communication with fireboats, rifle squads, fire engine houses, patrol wagons and police stations. Officials hope ultimately to have every policeman equipped with receiving apparatus, weighing but a few ounces.

Owing to the shortage of coal and the manner in which the government regulates the distribution of fuel in Berlin, the hot bath has become such a luxury that many persons have ceased bathing.

The Maine blue-sky law is so strictly enforced that many companies which have no difficulty in securing licenses to offer their securities in other blue-sky states have to resort to the medium of the mails to transact business in that state.

A farmer in Saskatchewan has found clay deposits on his land from which he has been manufacturing firelighters on a small scale. The lighter is in the form of a brick. If soaked in kerosene a few minutes and ignited the brick will burn for a half hour with a steady flame and when exhausted can be replenished with kerosene and used indefinitely.

A New York magistrate sentenced a barber to five days in the workhouse for presenting a bill of $6.15 to a customer desiring only a shave.

More than 100,000 volumes and thousands of pamphlets on the Great War have been collected by the French Government. The collection of manuscripts, photographs and war records is appalling as to numbers and a building will be erected having five miles of shelving. Princeton University and the University of California, in this country, are especially strong on war material.

As a result of many years of study, a machine has been developed in Lyon, France, to make raised embroidery in gold and silver. The stitch is a copy of an ancient form of embroidery and gives an impression of handwork. The machine uses the metallic thread.

One of the greatest butter centers in the world is Cork, Ireland. One year's export of butter amounts to nearly 750,000 tons.

A searchlight, sixty inches in diameter, will be installed on Mount Tamalpais, near San Francisco, to illuminate an amusement park on the mountain. The rays of the searchlight will pick up a battleship twelve miles at sea and is five hundred times stronger than a locomotive headlight.

During the past year the Chicago, Milwaukee & St. Paul Railroad handled nearly sixteen million passengers, not one of whom was killed.

By ordering her milliners to use no wild bird plumage on her hats, Queen Mary has bestowed the royal approval on the movement in England for the protection of plumage birds.

A London man placed a plum pudding in a tin box embedded in a sack of lime. Tying a rope to it he lowered the sack ten feet below the surface of the Thames. When raised to the surface at the expiration of two hours the pudding was found to be cooked thoroughly. On contact with the water the lime slacked, causing sufficient heat to cook the pudding.

Phonographs operated by compressed air keep the throngs moving in the underground tubes of London. The instruments are equipped with sound amplifiers. The records last about a week and contain such messages as "Keep Moving, Please," and "Pass to the Left."

Seeds from the chaulmoogra tree of India, the oil of which forms the base of a treatment successfully used in treating leprosy, have been received in the Philippine Islands by the Bureau of Science. An attempt will be made to grow the tree for this purpose.

The prison population of the Middle and Southwestern United States decreased 12.4 per cent in the last six years. This falling off in prison population of this section is equivalent to more than the combined prisoners of Kansas, Iowa, Wisconsin and North and South Dakota in 1914.

A New York garage owner whose safe had been cracked twice improvised a shrapnel shell, consisting of a liberal charge of gunpowder and buckshot. He placed this in the cash box of the safe in such a manner that upon opening it the charge would detonate. Following a loud report the watchman found the charge exploded and blood on the floor. The burglar had escaped.

COURAGE THAT DOES NOT FALTER!

And a Magazine Devoted to YOUR Interests!

The American people are paying tribute to the one magazine in this country which has courage to print the truth—which does not fear the powerful interests that exercise such a tremendous influence on the newspapers and periodicals of the United States. Not only are we continuing the discussion which has aroused the entire country to the conditions which have been created by a highly-organized minority, but our plans call for the publication of further truth-telling, informative articles on subjects which for the most part heretofore have been denied the public.

In the Light of the London Conference

A Study of French Reaction—By GEORGE D. HERRON

AN EMINENT European journalist has characterized Professor Herron as the strangest personality and the one honest man who had to do with things concerning the war. Just what Professor Herron's work was during the war is not known; for it was a work done in the background, behind the stupendous scenes of the world-drama. But this much is certain, that tremendous issues passed through his hands, and that much unwritten history was made in his house in Geneva.

Professor Herron was appointed to go to Prinkipo by President Wilson, and was widely and loudly denounced by financial and ecclesiastical interests as a Bolshevist, at the very time he was fighting with fire and flint against Bolshevist tendencies in the Peace Conference, and against the purpose there evident to make peace with the Soviet Government in the interest of certain international banks. For a year previous, Professor Herron had been warning and warring in the councils of government against the Bolshevist peril: for the truth is, that to Professor Herron's mind the Bolshevist power was a veritable anti-Christ, a delusion and betrayal of the working-classes of the world.

GEORGE D. HERRON

I.

THE gods have rung up the curtain on the third act of the world-tragedy. The London scene of yesterday may prove the most woeful moment for mankind since the armies of the kaiser crossed the Belgian frontier. No man can foresee what greater and worse wastes of life, what ultimate agonies and sorrows, what conclusive despairs, will disclose themselves upon this planetary stage, ere the curtain comes down. It is as if the life of man upon the earth was now released to sheer fate; as if the reins of human destiny were at last tossed to maddest chance. And this at the hands of the men we conveniently call statesmen—the men who have made themselves keepers of the nations; who have ostensibly charged themselves with the responsibility of procuring peace for the peoples. Nor is it merely their incredible callousness and baseness, their stark treasons and perjuries, that so bemazes the peoples and renders them impotent to act; it is the revelation of a stupidity, both moral and intellectual, that parallels even the cupidity and duplicity. It is the total lack of brains, of any sort of adequacy, as well as the absence of all apprehension and pity and prescience, that denotes the London Conference as the dark opening scene of a new stage in the world-tragedy—a new descent of man down the Tartarian steeps.

And this new stage has been set by the Parisian Junta that imposes itself upon the world as France—the France that compassed the deception and destruction of Wilson; the France that achieved her peace of loot and revenge; the France that, seeking a dead Germany, would yet somehow make the dead Germany a perennial living tributary; the France that would make the kingdoms and peoples of continental Europe her military satrapies; the France that has armed Poland and Hungary and Rumania for a new and early war against Russia, and that is meanwhile subsidizing new Russian revolutions. It is the France that would not and will not let the world have peace in which to recover and live, or even peace wherein to die. It is the France whose agents, military, diplomatic and financial, have at every point in Europe and Asia and Africa, and from the day of the armistice till now, striven and plotted against reconciliation among nations and good will among men. *It is the France whom Germany has conquered: for the belief that France has conquered Germany is legend and nothing more: Germany has conquered France utterly. In the light of the actual and the essential, the victory of Foch is a tale for the nursery histories that supply our common schools. It is the mind of Germany that is marching on through French propaganda and military adventure. What yesterday was Prussian is today the soul of France. And not by coercion; for France dwells eagerly and voraciously, of her own free and wilful choice, in complete captivity to the Prussian purpose, the Prussian spirit.*

II.

It is a mere waste of time and patience to discuss the London Conference in moral terms. It was an occasion as unmoral, in fact, as far removed from sense or question of right or wrong, justice or injustice, as the sirocco of Sahara or the scream of the hyena in the desert night. The essence of the conference was the struggle of France for a pretext for the occupation of Germany. Britain yielded, finally, in the hope of having done with the French bother, and of thereby being better able to carry on her own imperial appropriations of Asia.

It is true, the Italians fought hard against the application of the sanctions. The man who incarnated what was left of moral sense or dignity in the Supreme Council—the man who indeed rose head and shoulders above the other Allied representatives—Count Sforza, of Italy, strove mightily in the background for a policy of reconciliation and against the French program. Yet, because of the economic dependence of Italy, Sforza and his worthy colleagues were forced to give their ashamed and indignant consent.

As far as the French were concerned, the conclusion of the conference was pre-arranged. No one would insult the French representatives by believing that they expected the amount fixed at the Paris Conference to be paid by the Germans. These are astronomical and not terrestrial figures—figures to be mobilized for the measurements of the stars and the spaces, but figures beyond the facts and finances of our little earth. The sums named at Paris were never meant to be taken seriously except by the stupid international public. The purpose of Paris was to name an amount so high, and to lay down conditions so drastic, that their inapplicability and the consequent German rejection of them would provide pretext for the long-prepared French invasion of Germany.

The British knew this very well—though in the end they yielded abjectly, and the British prime minister became the French spokesman. As the *Daily News* of London put it, "Mr. Lloyd George brushed aside the solid offers of a peaceful solution put forward by the German delegates, and committed the Entente to the gravest decision taken since the armistice. There is not a single intelligent student of the reparation problem who will not recognize in this hopeless and barren speech a complete capitulation to France. It represents, in fact, the triumph at last of the French policy of revenge and all the sinister implications that it contains. It is scarcely surprising that the British prime minister said not a word in legal justification of the application of force, for it is legally indefensible. On moral grounds, what is there to be said for it? The Allies are to invade Germany to enforce the terms of a treaty which they have themselves discarded. They refuse to give even the most cursory examination to a proposition which meets, for the first five years, at least, all their demands."

III.

So the march to Berlin has begun. The Parisian Junta, having previously penetrated and corrupted the whole of Europe, has achieved its initial purpose. Assembled behind the prestige of Marshal Foch (whose knowledge of economics and politics scarcely exceeds that of a child of four) the Junta bestrides the Continent. Before the vision of this Junta looms a South Germany linked with Austria and Hungary under the Hapsburg crown, the whole administered as an essential French protectorate. The same vision joins to this confederation that monstrous French imposture of a restored Polish nationality. In the same evil vision Rumania is bound to a French Poland and a French Hungary in an early advance against Russia. A Romanoff Russia, financed and exploited and directed from Paris, completes the black Apocalypse.

Such is the precise program of the politico-financial group which governs France—the profiteers, who, by underground means during the war, furnished the Germans with munition materials wherewith to kill Frenchmen; the men who have capitalized the bones of their country's sacred dead, and who have made merchandise of the miseries of devastated France in all the markets of the world.

Yet blinder men have never been, and never has power been more blindly wielded. For whatever happens now, Briand and the Junta he serves have signed the death-warrant of France. Everyone who loves France, everyone who has militantly defended the French cause (as the writer of these words has done), will weep over the ruin the French rulers have wrought. The farther France now marches upon her program, the deeper will be the perdition upon which she enters.

IV.

It is possible, of course, that within a week or two the Germans will make new propositions—propositions so conciliatory, so obviously the extreme of what Germany can do, that England and Italy will demand their acceptance.

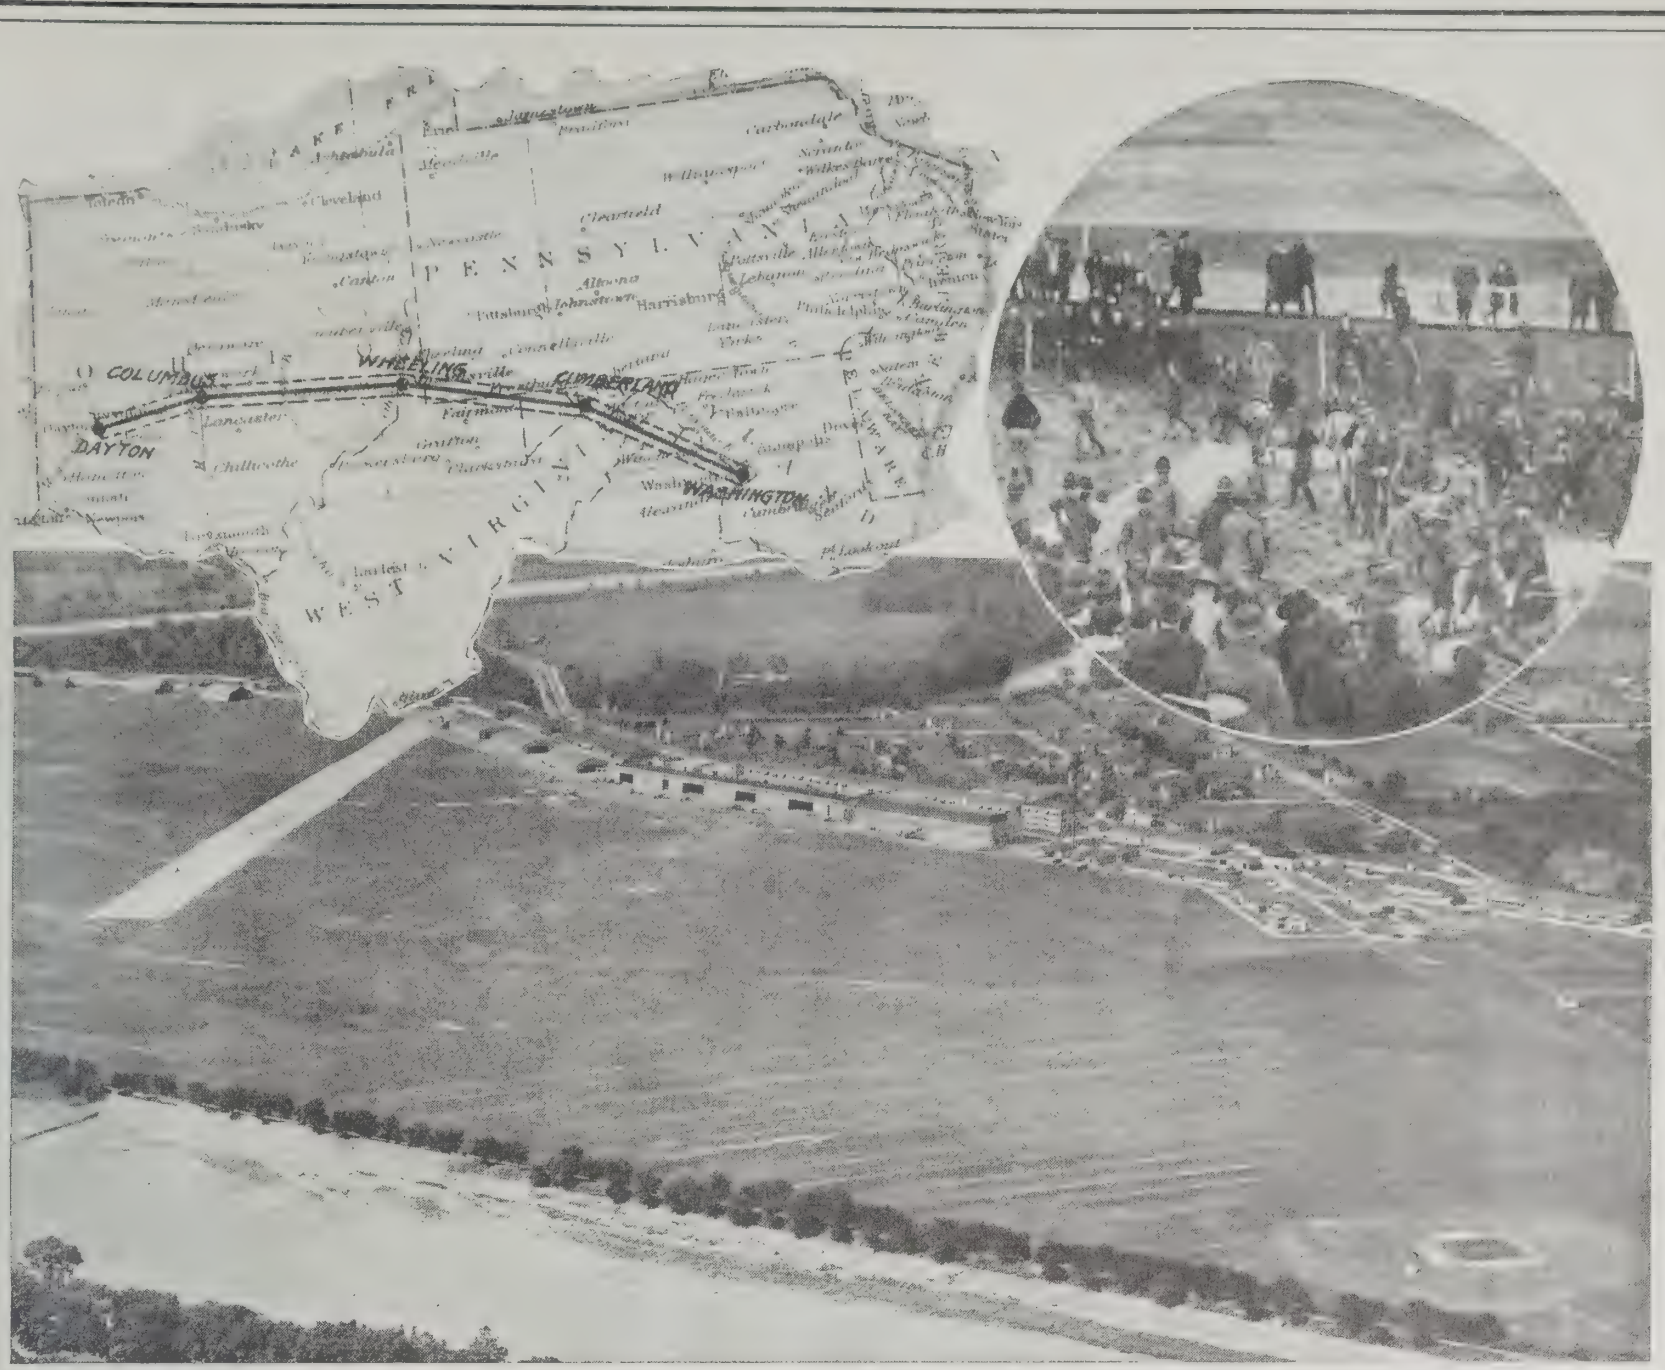
Even so, the masters of France will not take their teeth out of the body of Germany.

Keep this fact steadily in mind: *the keepers of France do not want Germany to make satisfactory reparation.* What they actually want is a pretext for the indefinite occupation and exploitation of Germany. Even if the Germans satisfy the very last demand of the French Government, France will henceforth give Germany no peace, no chance to recover. France wishes to demonstrate to the world that Germany cannot be safely left at large except under French domination.

Indeed, the whole French program in Germany, in Europe, in Asia, is not for peace anywhere or in any particular, but for war and conquest everywhere and in every particular.

Or it is possible that Germany will settle down into an indefinite non-resistance of the French occupation. There are not a few of the ablest men of Germany who urgently counsel this resolution and procedure. They feel assured in their own minds that this is the way to a victory more complete than ever the Prussian armies could have won. They know perfectly well that France cannot continue an occupation indefinitely without her own national bankruptcy ensuing. They know that the French Government has no money wherewith to continue such occupation. They also know that, though the population of France is the richest on the Continent, yet the possessors of French wealth have always escaped taxation; nor will they now pay the taxes that might save their country from national bankruptcy. The Germans further know that England cannot and that America will not furnish more money to France. The German tactic may therefore be to let France exhaust herself in her scheme of occupation and administration.

Moreover, the Germans know well enough a monstrous fact carefully concealed from the English and the American public. That is, that *the enormous French deficit and threatened bankruptcy are not due to the money France has spent and must yet spend in restoring the devastated regions. The deficit is due to the French military career of the last two years: to the subsidization of continued invasions of Russia;* to the maintenance of Polish armies—for the being of which there is no excuse; to the military occupation of Hungary—now bursting with French munitions; to the wicked and utterly indefensible conquest of Syria—whose Lebanon people are more capable of self-government than the Poles or the Serbs or even the citizens of Paris; to the conscription and maintenance of the millioned black hordes of French Africa; these are the sources of the French deficit, these are the places where the money of France has gone. And that Germany must justly be made to pay for the immense ruin she has wrought does not in the least change the fact that the restoration of these ruined regions is not the cause of French bankruptcy. The cause is, as I have said, the vast and varied military adventures of France since peace was supposed to have been made.



V.

It may be that the British, seeing the incorrigibility of Paris, have finally though secretly decided to let France go her own way and unto her own doom. There is no doubt that England would like to be relieved of France. The drag of France upon the British neck is becoming practically insupportable. The British probably foresee that if France marches to Berlin, and at the same time sends her military missions to lead Poland and Hungary and Rumania against Russia, the French missions and armies may never return to Paris, or return only in fragments. With France thus disastrously occupied on the Continent, England can have Western Asia to herself. France has been a continual block in the wheel of the British imperial program since the armistice was signed. That France has everywhere intrigued against England, that France has always been faithless to her Allies—of this the British foreign office is perfectly aware. Thus there is the possibility that not only Germany, but Great Britain as well, has decided that the best way to deal with France now is to let the Parisian Junta have its way. And, meanwhile, through the gates of Hamburg and Bremen, Great Britain will have come to satisfactory if tacit commercial arrangements with Germany, and not much of worth be left for either France or America.

VI.

But there is a more direful and even probable consequence to be considered. It is this—that a military dictatorship will rise in Russia with Trotsky as dictator and with Lenin eliminated; and that this thoroughly militarized Russia will come to terms with the industrial magnates of Berlin and the Junkers of Prussia. Germany may feel driven to this as her last hope of self-preservation. If that military dictatorship triumphantly arise, then the fabled and French Poland will quickly dissolve before the Russian advance, and Russia and Germany will march together toward the Rhine. Stricken Austria will revive as a state of the German Empire, and amid the whole convulsion engulfing Europe and bringing woe upon America, the catastrophe of western civilization will be complete.

America's First Model Airway

By HOWARD EGBERT

IN these days of persistent striving after perfection, it is little wonder that the American air service, limited enough as it is in its abilities to develop as it would like to develop because of reduced congressional appropriations, is reaching out and away from ordinary attainments and seeking after something that will approach, if not altogether reach, perfection.

The year 1921 is going to be unusual in the game of aeronautics. Engineering triumphs have been predicted that are said to be amazing. Science is marching on in its way toward accomplishment. This is as it should be in the United States, because while the first heavier-than-air flying machine was flown in America and designed by Americans, other nations have outstripped us in very large measure in the manner of scientific development of the airplane. Only recently has the contest become more equal. And there are many who are willing to predict that at the rate we are developing we shall within an amazingly short time find ourselves where by every inherited right we belong—at the front.

Everything that has been planned may not come to pass. Science plans through the eyes of vision. Science sees much farther ahead many times than she is able to reach with one step.

Everything has to have a beginning, and so the first model airway in the United States, which will join the M'Cook Experimental Field in Dayton, Ohio, and the Bolling Field, near Washington, D. C., is at once a pronounced step in the direction of achievement, and an augur of some of the things which the national air service, we are told, has in mind.

It is necessary, or at least it will be necessary one of these days, to have well-organized air routes connecting every part of this country. Airplanes are becoming more numerous. Private commercial establishments are utilizing flying machines to deliver goods. Charles F. Kettering, chief engineer for the General Motors Company, from his home near Dayton, Ohio, takes a flight every morning before he marches into his private office and sets to planning. Individual use of the airplane is increasing almost with each passing day. This being true it needs no lengthy discussion to prove that the air must be charted in somewhat the same way the highways are marked. As a matter of national defense the air bureau at Washington has felt the need for great national air lines. The model airway which is in course of development is the first and most important step thus far taken in the direction of bringing the aerial service to the point where in every particular it may be said to be useful. The limitless and boundless ocean of air can best be utilized through a systematic method of charting the air. This is the purpose involved in the model airway. Once this model is found to be practical and serviceable the air bureau proposes to chart other aerial highways, so that in another five years it is reasonable to believe that there will be no limit to man's ability to fly from city to city without losing his way or coming in contact with other machines which may be coming from an opposite direction.

Cross-country flying, or flying by night will be served in an immeasurable manner by the utilization of this model airway. It is no small task to plan for this innovation. Cities along the route between Dayton and Washington have been asked to co-operate with the government in the establishment of useful and safe landing places. Already many communities have acted. Others will be urged to get busy at once. A recent bulletin issued by the government shows how important and far reaching the program really is. This bulletin says:

"These air routes will provide a network whereon the units of the National Guard and the Organized Reserve can be placed. However, these highways of the air will not be usurped by the air service but they will be open, under legislative restrictions, to all commercial operators who will receive all the benefits and conveniences of such an organization, therefore commercial aeronautic interest will be fostered."

A point that is developed through the first model airway is to demonstrate that aviation control after all, is a matter for Federal rather than for state control. It is believed that the model airway will convince any doubtful person of the necessity for such control.

The first model airway has been selected with many things in mind. It will, therefore, serve as a basic guide in the program of expansion. Practically all of the natural problems which face pilots of airplanes will enter into this route. Besides connecting the national air service headquarters at Washington with the air service engineering division headquarters in Dayton, there are mountains to be crossed and a variety of atmospheric conditions to be encountered. Terrains of almost every type and character lie between Dayton and Washington. The army air service has no authority for buying land for landing places for machines and the point that has been emphasized is the importance of communities which lie between the two cities which are terminals assisting the government by laying aside fields which may be utilized for landing airplanes. Radios, hangars, and so on, are among other necessities which municipalities will be called upon to share with Uncle Sam.

The accompanying map shows the route for the first model airway. Ohio, Pennsylvania, West Virginia and Maryland will be touched, with scores of cities lying en route. In many of the smaller places no landing fields will be necessary. Flyers along the route will be in constant radio communication with each other and a system of perfect contact has been devised for the formal opening of the first model airway.

"Reparations"

FRANCE has succeeded very distinctly in impressing the world with the fact that the new war against Germany will proceed unless the question of reparations is settled. "Indemnity" is the term now quite openly used, although, throughout the war and the armistice and the peace negotiation periods, that term was indignantly spurned and it was insisted that the Allies sought only just and fair reparations for injuries inflicted on the civil populations. Germany's latest offer of 200 billion marks gold (or $40,000,000,000) is about three times what disinterested economists of high standing have estimated it would be possible for Germany to pay. It comes within $5,200,000,000 of the sum demanded by the Entente powers.

Quite aside from the amount of the indemnity, there arises the difficult question of manner of payment. All the gold in the world would not suffice to meet the Allies' demands, and Germany owns but a small part of the world's stock. It is obvious that payments must be made in goods, or in goods and services. With some show of reason, the industrialists of Great Britain and to some extent those of France object to this solution. They argue that if German manufacturers, backed by the German Government, are forced to study for a period of forty years or so how to pay such vast sums abroad, in addition to providing for home needs, Germany will be likely to develop her industries to a point where they will become supreme in the world's markets.

These objections would hardly apply to a method of payment in services that has been several times proposed by Germany, but haughtily rejected as "unthinkable" by France's representatives, and stamped as insulting to the national dignity by the Paris press. This method is the furnishing of German labor and materials for the actual work of reparation in the devastated districts of France and Belgium. For one thing, it is certain that no better way could be imagined for impressing the German people with the heinousness of their government's crime against civilization; for teaching them the great lesson of the war; its foolishness and unprofitableness from every point of view. The net results of the almost inevitable changes such an experience should work in the German mentality would, in the long run, prove a much more dependable protection against future German aggression than could military occupation of the Rhine and the Ruhr valleys.

It is certain that the unfortunate populations of the devastated regions, who have been made to suffer so sorely by these delays, have no objection to the Germans tackling the task which their own frightfulness made necessary. What then is the explanation of the refusal of the French Government to allow the Germans to work out part of the debt to France, now repeated by Dr. Simons, the German Foreign Secretary, in connection with his latest offer of 200,000,000,000 gold marks as a total indemnity?

Speaking plainly, it seems to be dictated by the same shortsighted and selfish "big business" and banking interests that seek to monopolize all possible profits to be reaped in connection with France's industrial reconstruction. It is in line with the refusal, at the dictation of these same interests, to permit Lille cotton-mill owners to purchase American machinery, although American manufacturers were ready to make deliveries some six months earlier than could the French machinery makers. To bar American competition, the damaged and looted mills were kept idle, thousands of men unemployed, while consumers were obliged to pay extortionate prices for reduced stocks. It is in keeping with the policy that allowed thousands of American automobiles purchased by the French Government during the war, but which its sudden cessation found lying on the docks or in the warehouses at Havre and Brest, to rot and rust in disuse, rather than allow them to go on the market and relieve an acute transportation crisis. This, although French auto manufacturers were so overstocked with orders that they would not promise deliveries within a year! The policy is in line with the adoption of import tariffs so high as to be prohibitive, and with custom house regulations deliberately designed to hamper and restrict importations from America.

An Old Cure for Worry

MIND cure of the variety which has come to be known in our modern day as "New Thought" seems to have roots that run back into an olden time. In a quaint and curious volume of forgotten lore entitled, "The Physical and Mental Treatment of the Human Body," written by Dr. Manseman, an eminent English medico, and published in London late in the sixteenth century, we find the following cure for worry:

"Let the sufferer think of the person he or she loves best; dwell upon his charms and graces; cogitate deeply upon the affection they bear the one for the other. If this does not have a soothing effect, then let the patient try a small draught of strongly brewed tea with a lump of ginger in it. The efficacy of this is wonderful."

It is not quite certain whether the wonderful efficacy is to be attributed to the mental treatment, or to the strong tea with a lump of ginger in it. Perhaps it is the combination that the good doctor had in mind. It looks a little as if he believed in the wisdom of what betting folk call "hedging," somewhat on the plan of Br'er Rabbit planning to capture Mister Possum "a'gwine or a'comin'."

The prescription, as far as the first part of it is concerned, follows what we now regard as true psychotherapy. The chronic worrier is an out-and-out egotist, and the occasional worrier is an occasional egotist. The cure, consequently, is to switch his thought away from himself to some other line. But, instead of thinking simply of some beloved one who may be "uncertain, coy, and hard to please," or inconstant and a cause of doubt and anxiety, the better plan is to let the mind dwell on the goodness and beauty and splendor of life as a whole.

No man possessed by an enthusiasm for a great cause, or interested in his work, rather than in himself, will be troubled by worry. Still, there is no harm in a little "ginger" in the mental attitude.

Nebraska's Laureate

LET such literary centers as Boston, New York and Indianapolis look to their laurels! Nebraska has gone on record as the first of our American commonwealths officially to honor home talent in the minstrelsy line. The Nebraskan statesmen have crowned the brow of John G. Neihardt with the green-bay wreath of "State Poet Laureate." One consequence of the event will doubtless be an enlargement of Mr. Neihardt's public, despite the fact that he is described as an "epic rather than a lyrical singer."

And the precedent may have much more far-reaching consequences. Many people will wonder how the governor and legislature of Nebraska should have passed over the state's more famous son, William J. Bryan. The objection that the eloquent platformer is not a writer of verse—so far as the general public is aware—is trifling. Poetry is not a mere matter of prosody. Its very essence is imagination and fancy. What idle singer of an empty day could in a fine frenzy rolling approach, in either glowing imagination or flights of fancy, the eloquence of the great Nebraskan who has now for a generation thrilled thousands at frequently recurring intervals by the sweet cadences and swelling periods of moving rhetoric sonorously sounded over the roofs of the earth!

When one reflects that the ancient honorarium of the English laureate is a pipe of old Madeira (or is it a butt of malmsey?) one may be on the track of the seeming slight to one whom not only Nebraska but all the nation delights to honor. True, there would be no danger under the dry régime of Nebraska honoring this old custom. But there would remain the historic association with the serpent of the still, and to a man of imagination and conviction, the trail of the serpent would be over it all. No; William Jennings Bryan would undoubtedly have refused the honor and its perquisites. Yet, stay! Could not a way have been found to translate that pipe of Madeira into terms of grape juice?

Siegel Censures Hughes

ORGANIZED dictatorship is startlingly exemplified in the public statement made by Representative Isaac Siegel, of New York, concerning press reports of a communication to Congress from the Secretary of State. Flinging caution to the winds, this mouthpiece of Jewry virtually accused the head of the American Department of State of lying and ordered him to retract statements made in official reports calling for prompt and effective action in restriction of a class of immigration that he recognizes as imperiling American institutions. Mr. Siegel and his confréres must be possessed of monumental assurance as to their own power to permit them to risk the assumption of a position of such outrageous impudence. Secretary Hughes was reported as saying:

> **Our restriction on immigration should be so rigid that it would be almost impossible for most of these people to enter the United States. Reference is especially made to Armenians, Jews, Persians and Russians, all of whom have been so driven hither and thither since 1914 that they cannot be regarded as desirable populations for any country.**

It was on this statement that Mr. Siegel called to account Secretary Hughes in such cavalier fashion and with such studied insolence. Here are his words:

> "It is exceedingly regrettable that a report purporting to be signed by Secretary Hughes should have been issued from the Department of State .... The letter containing this memorandum is alleged to have had his signature thereon. *Undoubtedly, Secretary Hughes will promptly take steps to ascertain who is responsible for the issuance of the statement, which the entire world knows is false and untrue.*"

The veiled challenge in this utterance is certainly significant. Throughout the statement it is evident that the Jewish delegation in Congress was taken by surprise. It seems to have felt pretty certain of the new Secretary of State.

Technically speaking, Secretary Hughes made no recommendation on the subject of immigration. To have done so would have been outside his province. He simply transmitted to the chairman of the Immigration Committee abstracts of reports from government officials abroad. The Associated Press appears to have attributed to the Secretary the language of these reports. But the technical difference between adopting the language of these officials as his own and the transmission of the statements without comment, does not affect the question of Jewish criticism. It voiced Jewish displeasure with the indorsement of the views transmitted in their very transmittal, as the State Department's information on the subject.

It is Representative Siegel and not Secretary Hughes who comes out second in this new Semitic flurry.

As to the question of veracity raised by Representative Siegel, it should be sufficient corroboration of Secretary Hughes's characterization of the bulk of the immigration from the countries named that they are barred from France, Great Britain and Italy, and even from Palestine, as undesirable and dangerous. His conclusions are based on first-hand evidence of an absolutely impartial nature and the judicial fair-mindedness of the Secretary of State has never been impugned by even his enemies.

Both Frederick A. Wallis, Immigration Commissioner, and Wilbur J. Carr, head of the consular service in the Department of State, concur in the conclusions from 85 to 90 per cent of the immigrants arriving during the past year "lack any conception of patriotic or national spirit, and the majority of this percentage is mentally incapable of acquiring it."

John Wanamaker

JOHN WANAMAKER, now in his eighty-third year, was given a testimonial luncheon the other day by his fellow merchants in the Quaker City in honor of the completion of sixty years of merchandising, and the occasion is one that has marked significance for the present generation. "One of the greatest among American merchants and one of the finest among Christian gentlemen" was the keynote of many eulogies. The phrase well emphasizes the salient characteristics of a man true to those traditions of the old line of American "merchant princes" that made their names synonyms for honor and fair dealing.

Keen and alert as ever, Mr. Wanamaker, who is the only surviving member of the Centennial Exposition's board of finance, broached an immensely interesting project. Advocating the proposed celebration of the nation's sesquicentennial in Philadelphia in 1926, he declared that it should be made the occasion for nothing less than a "World Festival of Peace," in which the nations of the world would once more come together on a basis of friendship and co-operation for the good of humanity. All will agree that the project is a good one and that it could not have a more fitting leader than John Wanamaker.

Mr. Ford's Page

NO MAN is more dangerous, in war or in peace, than the man who tries to stop the processes by which the legitimate needs of the people are supplied. When a man attempts that in time of war, he is dealt with as a traitor. His character does not change when he carries on his work in time of peace, although his punishment does. The reasons which move him to act at one time are precisely the same as at another. He wishes to aid some cause by breaking down the established character of the people's lives.

Everyone remembers what was thought during the war of men who tried to induce the farmers to raise less food, the shop workers to complete less work, the railwaymen to invent unnecessary delays.

Now, suppose there is today a return of that same program, is it to be regarded as any more desirable now than it was then? If a thing is good and right to do, is there ever any justification for a conspiracy to stop doing it? Yet there is considerable propaganda at work today to make men quit doing the right things for society. The farmer is urged to raise no more than he needs; the shopman is urged to do no more than he must; the transport man is encouraged to let society go hang.

And this propaganda is having a certain amount of effect. To understand it, however, you must not too hastily condemn it. It is not enough to say that the program is wrong in every way in which it is possible to be wrong. We must understand why men are persuaded to such a wrong program. Men do not enter wholesale into a conspiracy to do wrong. Americans do not undertake to injure society for the fun or malice of it. They have been persuaded that it is a means to a good end—a harsh means, perhaps, but to be condoned for the sake of what it has in view.

That is the point. Take the farmer's case, for example. Many farmers are saying now that they will not raise any more this season than they need—little more, anyway. The farmer is, in many cases, sore in his mind. Things have gone badly with him—not in failure of the crops, nor in the enmity of the elements, nor yet in the loss of public esteem for his profession—but in a money way. He has as much of the wealth of the earth as he ever had, much more in fact, but it has not meant so much in money. Farming has ceased to be only a matter of making the earth perform her yearly miracle; it has been hooked up with banking; and, of course, the taint of money exerts a disturbing influence.

Wheat will make as much bread as before, but it will not make as much money.

Now, men have been busy telling the farmer that if he will forbid the earth to yield as much food this year, if he will exercise a prohibition over the beneficent forces of nature, prices will go up next year.

Doubtless they will, and with them will go up the cry of the people because of a scarcity of food.

The farmers are persuaded to do this as a protest against the banking and financial system that juggled their prices downward. That is to say, farming has been advised to annex the evils of the financial system in order to get even. It is a clear case of two wrongs being counseled in order to make a right.

The farmers do not deliberately say, "We'll make food scarce in the cities." They say, "We'll do something to check this game the masters of the money market have been playing on us." Yet the latter means the former. And even then, it does not mean that the game will be won. Instead of food there will be prices, and nothing was ever sustained on prices alone.

Now, having this understanding of what the farmers are taught will result from their action, let us see how the whole case stands.

Society is like a city. There are some functions which, in a city, can never stop without disaster: they are the primal functions, for the benefit of which people gather together in cities of similar communities. They are such things as water, light, police and fire protection.

Now, these things must be supplied, regardless. If the city is wild or drunk, still the firemen and policemen must stand guard, and the water station must keep pumping. If the city government is inefficient and the revenues of the city wasted, still policemen must pace their beats and fire stations must keep the watch alert. There are some duties which, if deserted, destroy the last chance of betterment and reform.

In the great national community, in the great world community, there are certain primary functions without which modern life is simply impossible, and even primitive life is impossible.

These are Agriculture, Manufacture and Transportation, the three great arts. Community life is impossible without them. They hold the world together. Raising things, making things and carrying things are as primitive as human need and yet as modern as anything can be. Yet we cannot get beyond them. They are of the essence of physical life. They are to the world what water, light and fire protection are to the city—indispensable. When they cease, community life is no longer possible.

Now, the truth is this: things get very much out of shape in this present world under the present system, but the hope we have of a betterment of matters is that certain things are going to stand firm. The basis for a better state of things is here, if someone does not destroy the basis. As long as the foundations stand sure, a better building is always possible. Destroy the foundation, and no building at all is possible.

The great delusion today is to make the Men of the Foundation feel that they may trifle with the part they have been given by Destiny to play in the social process. They are being told that they are the victims, when as a matter of fact they are the world's chief hope, socially and economically. If they stand firm, they will help bring about the order that is desired; if they go fooling with the fundamentals committed to their care, no one knows what will happen.

Now, we have the main timbers for the new order, whatever it may be and whenever it may come. These main timbers are the men and means to *grow* things, to *make* things and to *carry* things. These will be the hold-overs, so to speak. Or a better figure still, they are the bridges all set to see us across without disaster. As long as Agriculture, Manufacture and Transportation go on, the world can carry any economic or social change.

But, if this bridge is destroyed, who knows what will come? And if it is destroyed, it will only have to be rebuilt again, and of the same men and means, and for the same purposes—growing food, making utensils, carrying goods.

It seems that if the men engaged in the three arts were only able to see the part they play, that they are really the great natural elements which prevent the old order from being as bad as it might be, and are absolutely indispensable to the new order, they would regard their responsibility more highly than the propagandists wish them to do.

The best service any man can now do to bring about a better state of things is to be absolutely loyal to the thing he is doing in the Three Principal Arts. Speculators may have to stop, but not farmers. Money-makers may have to quit, but not plow-makers. These necessary things tide over any break, and are already the substance of the newer time.

Anyone laboring in the Three Principal Arts today has a hand in remaking the world for his children. Anyone curtailing them is holding back society.

SOCIETY will pass from the present old order to the coming new order on a human bridge. That bridge will be the men who labor in the Three Principal Arts—the men who grow food, who make utensils, who carry goods; Agriculture, Manufacture and Transportation. These are the present elements of the future society; they will enable society to drop the old and assume the new without disaster. If these fundamentals are tampered with, if farmers prohibit nature's increase, and shopmen complete less work, and transport men grow lax, any calamity may be precipitated. The best reform is to keep sound processes soundly functioning, and not add to the general confusion. The pioneers of the new order are the men who stick to the job.

A Caco general now confined in Port-au-Prince penitentiary. He was captured by Marines. He is typical of the Caco leaders most of whom are now killed off.

Latin-America Is Watching Our Handling of Hayti

THE Harding Administration has inherited from the Wilson Administration many perplexing and vexing situations, but the future policy of this country in respect to the little "Black Republics" of Latin-American waters is one which is of great concern not only in Washington, but is being watched closely by the countries to the south of us, which are the beneficiaries of the declaration known to the world as the Monroe Doctrine. This and other articles will take up for discussion that which goes to make up the problem. The writer spent some time in Hayti as a newspaper correspondent and his knowledge of conditions may be accepted as authoritative and sufficient.

ADOLPH BOURGOT,
Gendarme sergeant, who testified he saw an American lieutenant shoot three prisoners at Hencho.

By WILBUR FORREST

CHRISTOPHER COLUMBUS, on his famous voyage in 1492, was the first to annex the great Western Hemisphere to the ancient maps of the fifteenth and sixteenth centuries. The island of Hayti, lying immediately southeast of Cuba, was reported by the discoverer to "their invincible majesties," Ferdinand and Isabella, in the most glowing terms for its "lofty mountains, plains, groves and very fruitful fields admirably adapted for tillage, pasture and habitation.

"The convenience and excellence of the harbors in this island and the abundance of rivers surpass anything that would be believed by one who had not seen it," the discoverer reported to his king and queen.

"Hispaniola" (Little Spain), Columbus named the island of Hayti and made further reports on the red-skinned Indian inhabitants who, he declared, "in their simplicity, bartered like idiots cotton and gold for fragments of bows, glasses, bottles and jars."

It is a long span from the Columbus description of virgin Hayti in 1492 to the primitive Hayti of modern times, but "Hispaniola" has today a peculiar interest for Americans, constituting as it does one of the most troublesome and likewise delicate problems that a national administration in Washington has been called upon to face in many years.

The Harding administration in Washington has inherited from Mr. Wilson's régime, however unwillingly, a situation in "Hispaniola" on the delicate handling of which will depend whether our future relations with all Latin-America shall again become the happy Monroe Doctrine co-operation of before the European war or remain those of suspicion and distrust which certainly exist at present. The new policy of the Harding administration toward the little Latin-American republics of modern "Hispaniola" is watched for eagerly in every Central and South American capital.

A brief sketch of our relations here would appear apropos at a moment when a new Secretary of State in Washington is engrossed in working out other interpretations of the Monroe Doctrine than have been applied by the United States in the Western Hemisphere for the past eight years.

Aside from all political phases, too, the comparatively small West Indian island of Hayti is a land of fertile interest for the student of more than elementary Columbian history; for lovers of historic romance, admirers of Londonian tales of tropic seas and for less sentimental and sober commercial futurists.

The island has two republics, the Dominican Republic to the east and the Republic of Hayti to the west. Approximately three million people, not one of them a descendant of the red Indians of the days of Columbus, inhabit the land. It is with the Republic of Hayti mainly that this article will deal. From many points of view it is the most interesting of all the island territories of the Columbian Western Hemisphere.

The "Black Republic" of today is not in the state of progress and affluence which Columbus must have dreamed for "Hispaniola." Its 10,000 square miles are crowded with about two million souls who have neither capability nor seeming capacity eventually for developing its excellent harbors, its fertile fields and abundance of rivers.

While a million people of Santo Domingo are mainly of Spanish strain and lighter in color, the mass of Haytians—about ninety-seven per cent of the whole—are of pure African blood and origin, dating their ancestry back to slave labor brought from Africa by the whites, the same whites who so thoroughly enslaved the Indians that they died like flies and eventually became extinct to a man.

Hayti is a land without schools. The mass is densely illiterate, clad poorly and often in rags and pattering a "creole" tongue which is a mixture of French, African and patois. And as distinct from the mass as dawn is from night is the *intelligenzia* of the little republic, mulatto in blood and ranging in color from deep brown to high yellow. This class is but three per cent of the whole and its culture is that derived from association with European capitals and foreign universities.

Perhaps the high culture of Hayti's educated minority has been the cause of steady economic, commercial and agricultural decline during 115 years of independence. Change of government has not usually been in accord with desire to uplift the downtrodden mass but practice of traditional tropic politics with the desire, as one student of the situation has expressed it, of the politically prominent "outs" to supersede the momentarily powerful "ins" and change of administration has never affected the common people in whose name most of the revolutionary propaganda was circulated.

Haytian rulers, some with expressed sincere convictions and others less honest, have held the executive power to the number of more than fifty during the independence gained from the French plantation and slave owners in the eighteenth century but never in the history of the country has the great mass of the common people had any voice in government.

Guilliame Sam was the last Haytian executive to suffer violent death. On July 28, 1915, American Marines landed in Hayti. Sam was the sixth president in less than five years. Michel Laconte was blown up in the presidential palace. Tancrade Auguste died in his bed, it is said, by poison. Michel Oreste fled from the country to exile. Oreste Zamor was overthrown by a revolution and was killed. Joseph Davilmar Theodore served three months with dignity and then succumbed to a revolt led by Guilliame Sam.

In an effort to forestall a revolution against himself, Guilliame Sam caused a large number of the best families of Port-au-Prince, the Haytian capital, to be thrown into prison and then longing for action which did not come he ordered the entire batch executed. Relatives of the victims started something which Guilliame Sam could not stop. They enlisted a mob and marched on the national palace. Sam took refuge in the French legation and here the mob found him. As they were carrying fragments of his body through the streets of Port-au-Prince, the Marines landed and put an end to the festival.

The Marines have remained in Hayti to the present. Under a treaty, alleged to have been written by Franklin D. Roosevelt, assistant Secretary of the Navy, and handed to the Haytian Government to sign, Marines may remain in Hayti for many years to come.

The benefits of Marine occupation in Hayti are not to be denied and more evident to those who can compare the "Black Republic" of today with that of 1915. Sanitation was the first problem and American experts worked against discouraging odds. They found squalor and filth everywhere. As before mentioned, but three per cent of Haytians are of the class to which the bathtub plays its part. The remaining percentage desire hygiene only when hygiene searches, finds and persists. The lack of body hygiene and general lack of sanitation was perhaps responsible for a mysterious disease among the lower class which is estimated to have killed twenty thousand natives annually for 50 years. When the Marines had been ashore long enough to begin the work of sanitation, it was necessary to send wagons throughout the larger cities at daybreak every morning to collect victims of the mysterious malady. The cities were little better off than the villages which were perhaps not so clean as the African settlements which they resembled.

Marine Barracks (foreground) and Presidential Palace, Port-au-Prince, Hayti.

It had been the convenient custom for generations to dump all rubbish, decayed fruit and filth in the highways and depend on nature to do the rest. Tropical rains and blazing suns produced vapors and odors guaranteed to convert all who had not lived through a survival of the strongest into victims of fever and disease. Epidemics through which even the strongest were liable to fall were a constant menace.

With this background, one may imagine by what effort during a brief number of years that Americans have made the cities and villages of Hayti livable communities. Well-ordered streets and sanitation within limits everywhere are now the rule. Quarantine regulations for steamships are enforced by Americans for the first time in Haytian history. In 1882 smallpox brought to Hayti on a Jamaican ship swept the land and took off about two hundred thousand natives.

American Marines have built or repaired hundreds of miles of native highways since the occupation. Districts formerly inaccessible to other than foot or horse travel are today opened up for agricultural and commercial development, a development which has not yet come for reasons which will later be described. It is possible now to travel by auto between the main cities of the land, on plains, through fertile valleys and over beautiful mountains, a medium of communication unheard of until the Americans came.

Hayti is today more peaceful than at any other time in a century. In generations of strife and revolution, during which the country retrograded rather than progressed, the one necessity which called American forces to the "Black Republic" was peace. This peace is now a fact though it has been accomplished not without innumerable encounters over a period of years between the forces of occupation and groups of organized bandits infesting mainly the mountainous portions of the republic.

The coming of Marines to Hayti also sounded the death knell to the degrading practices of "voodoo" rites or snake worship which the ignorant mass celebrated everywhere. These rites for them took the place of any higher form of religion and are supposed to be the instinctive outgrowth of tribal orgies practiced by their ancestors in darkest Africa. The human sacrifice was among the most terrible features of "voodoo" festivals in the cities and in the bush. The Marines destroyed the "voodoo" temples, the great tom-toms which called the superstitious to their assemblies, and forbade any practice of "voodooism" everywhere.

Problems of spiritual betterment, sanitation and communication building were functions of the American Marine Brigade in Hayti which caused little comment at home. It was the rigorous manner in which the American "leathernecks" brought about peace in the "Black Republic" that eventually crept into the Harding political campaign at home and brought the Marine pacification program into the glare of publicity. Tales of mountain encounters between Marines with the Gendarmerie d'Haiti, the latter a subsidiary military organization composed of black troops officered by Marines, and Haytian bandits would fill a fair-sized volume. It is a sordid chapter of guerilla fighting in which Americans recalled the lessons of ancestral woodcraft and the examples set in the American Indian wars. When the last bandit chief had been killed and his forces scattered, the scene shifted to the United States. In a moment of exuberance assistant Secretary of the Navy Roosevelt let slip in a campaign speech that he had written the Haytian constitution and it was a good one if he, himself, said so. This drew from the Republican presidential candidate in another part of the country, that United States Marines in Hayti, under the Wilson controlled Navy Department, had been charged with the "indiscriminate killing" of more than two thousand Haytians. Then the verbal fireworks began.

The political charges boiled down to a letter which Brigadier General George Barnett, U. S. M. C., had written Colonel John Russell, commander of the Marine Brigade in Hayti, expressing horror that "indiscriminate killings" of Haytian natives had been going on in the West Indian Republic. In this letter Barnett mentioned the Haytian casualty list which he placed at 3,200 but later reduced in subsequent testimony before a naval board to 2,200.

The Naval Board of Inquiry, composed of Admirals Mayo and Oliver and General Nivelle, of the Marine Corps, appointed by Secretary of the Navy Daniels held sessions first at Washington and later at the Haytian capital. The inquiry elicited that practically all Haytians "indiscriminately" killed had fallen in open combat between the forces of pacification and banditry. Officers of the Marines, in testimony, convinced the Naval Board that cases of "indiscriminate" killing were the isolated incidents which would befall any military organization

and had been punished by vigorous courts-martial. The Republic of Hayti, however, as facts outside the scope of the Naval Board developed, has not gained what it should during five years of American guidance. Retrogression has been arrested by military action but what of the economic progress?

Philip Sudre Dartiguenave, who succeeded the ill-fated Guilliame Sam as Hayti's chief political executive, in an interview with the writer at Port-au-Prince some weeks ago blamed not the Marine Corps for his country's lack of progress. The chocolate-colored executive who received me in the glittering white national palace put the full blame on the shoulders of American civil officials, appointed by the Wilson administration and sent to his country to supervise the provision of the Haytian-American Treaty of 1915.

Dartiguenave made charges against these officials which challenged the good faith and sincerity of the United States throughout all of Latin-America. He charged that the treaty which pledged the augmentation of the republic's finances, economic and agricultural development and other requisites had not been observed. He charged tactlessness and bullying and specifically named John McIlhenny, of Louisiana, and American Minister Bailly-Blanchard, of the same state, as the officials responsible for non-observance of America's pledged word. These officials, he said, had kept the State Department in ignorance of conditions and had misrepresented him to the same department.

"The treaty obligations of the United States to contribute to the economic development of Hayti, ameliorate her finances, augment her resources and otherwise work in harmony toward her betterment have not been observed," said the president. "Instead, the Haytian Government is under a humiliating guardianship for lack of co-operation. Its efforts to collaborate with good will are disdained and repulsed. It seems that there does not exist between the two governments an analogous contract that the two parties are obliged to respect."

The Presidential Palace.

Dartiguenave demanded of Washington a congressional inquiry reiterating that hope for development in his little land depended entirely on the United States making good its solemn promises with all evidence of co-operation and good will.

Haytian ministers of state, interviewed by the writer, and American business men who went to the republic to develop business, confirmed Dartiguenave's charges which have been given here only in part.

Mr. C. E. Elliott, of Indianapolis, president of the Haytian-American Sugar Company, told me he went to Hayti under development assurances afforded in the 1915 treaty. These assurances, Mr. Elliott said, have been violated by the officials of the Wilson administration to such an extent that the company's twelve million dollar investment promised failure and was in such a non-productive state that neither directors nor stockholders would favor the expenditure of another cent in the republic until the Wilson administration officials were forced to assume responsibilities placed upon them by the American nation's pledges.

Thus we have in briefest outline, the present situation faced by the Harding administration in Hayti. This would appear far less serious if it might remain an affair purely between the United States and the little republic. But Latin-America is watching. Are America's intentions sincere? the Latin-American capitals ask.

But the conduct of the past administration in Hayti is not all, that Latin-America has known better than Americans themselves have known it. It spreads completely over the small West Indian island. We are charged with the violation of our sacred word of treaty by none less than the president of Hayti. Now come charges, if anything more serious, made by the president of Santo Domingo, Dr. Francisco Henriquezy Carvajal, that our conduct in Santo Domingo is not only a violation of our treaty with his country, but flagrant violation of the Monroe Doctrine itself.

Dr. Carvajal's views were made public for the first time recently in a New York newspaper. He charged the same New York financial interests named in Hayti with using influence on the American State Department to bring about American occupation of Santo Domingo. By written order of President Wilson, he asserts, American military forces made him an exile, suppressed the offices of all Dominican national officials, wiped out the Dominican congress and for several years have operated his government to suit their whims.

"The action of the Wilson administration in my country is not only in violation of the Dominican-American treaty of 1907; contrary and in violation of the fundamental principles of international law, but if anything more serious, is a complete violation of the great Monroe Doctrine and the rights and protection it is supposed to give all Latin-American countries against not only European nations but the United States as well," said the Dominican president.

But the most serious aspect of all in the charges preferred by both presidents of "Hispaniola" against the American nation, as represented during the past eight years by the Wilson administration, is the effect on nations, large and small, in South and Central America. The effect is no secret in Washingon. The Dominican president in his recent New York statement, expressed the situation with blunt clarity when he said:

"The nations of Latin-America today view the United States with a feeling of distrust and suspicion which must seriously affect both political and commercial relations between your country and theirs for some time to come."

To win back this Latin-American respect for American good faith and sincerity will not be merely a series of lectures to South and Central America on our American record in Cuba, the Philippines and Porto Rico. The problem constitutes one of the most delicate tasks in front of the new Secretary of State and the Harding Cabinet.

Thus has "Hispaniola" of Christopher Columbus, its fertile fields undeveloped, its harbors devoid of commerce to any extent and its abundance of rivers as they were over four and a quarter centuries ago, become an American problem of 1921.

But to return to the more physical side of "Hispaniola." There are notable differences. Santo Domingo has far greater national intellect than its sister republic. Schools have long been in operation. Spanish blood is predominant in the veins of its nationals. With greater intellect of the mass and an ability to govern in peace rather than along the line of political revolution, it is to be expected that the withdrawal of American military forces in this republic will soon come about and the country turned back to its native executives. Within the past few years, the Dominican Republic has seen far more economic development than Hayti, its finances have been augmented and an election in which the popular will may be expressed is possible.

Can the United States leave Hayti so easily with its expressed treaty obligations unrealized? As previously stated, Hayti's mass is overwhelmingly illiterate and of African blackness while the infinitesimal minority are educated adepts at the hectic game of intrigue in tropic politics. Hayti has neither development, commerce, industry, schools nor guaranty of stable government. It is frequently said that a revolution would follow the departure of our occupational forces by a few days and the Marines would scarcely be away long enough to settle down on their battleships before trouble would necessitate their return.

For more than a century the Haytian mass have followed the African instinct back to barbarism. Previous to 1804 by fifty years their land under the French had become the richest area in the West Indies. Great plantations of sugar and coffee covered the land. Beautiful cities, built after the French plan, graced the seaports, which were constantly filled with craft carrying the products to Europe. Napoleon looked upon his West Indian possession as the richest under the flag of France.

When Toussaint L'Ouverture, an ex-slave, led a revolt against the French land and slave owners in 1798, there started a period of terror which ended in 1804 when Dessalines, the successor of L'Ouverture stood on the seashore at Gonaives, tore the French tricolor into three pieces, cast away the white and ordered the red and blue bars to be fastened together as the flag of independent Hayti. The whites had been expelled. Generations of despotism, revolution and strife have followed. The great plantations of the French, their rich architectural dwellings both in city and country have gone the way of ruin. The ruling class one finds today in Hayti is gathered in the cities mainly Port-au-Prince and Cape Hayti, the largest communities of the south and north respectively. In the country districts nature has been allowed to take its own verdant rank tropical course. At the outskirts of the larger habitations begins the Haytian bush where bountiful tropical vegetation grows rank and virtually unattended.

The writer of this article at Port-au-Prince, Hayti.

The traveler in the "Black Republic" today may see nature taking almost full responsibility for the bulk of the republic's illiterate mass. They are content to let nature do it. The southern peninsula district, an area of about three thousand square miles of the richest land in the republic, is typical. Even the most primitive of agricultural implements are unknown to the average rural Negro of the fertile south.

The markets of the world are demanding good grades of long staple cotton, yet it nods at you gracefully from its wild parent tree until you wonder what is the answer.

Coffee is not exported from Hayti to any extent, yet coffee grows wild in gayest abandon along the roadsides and trailsides. It asks not for cultivation but hangs there to tempt the ambitious person to pluck it before it falls to earth to perpetuate its kind. One is forced to wonder why the bulk of American coffee is shipped from the far-off Andes or even from the Orient.

Hayti's greatest asset at present is her cheap labor. The native is worth from twenty to fifty cents a day when he can be induced to work. It might be added that the greatest fortune which our great protectorate nation could endow on the little republic would be a campaign of agricultural education to give the rural Haytian a knowledge of the productiveness of his soil.

Clumps of stately cocoanut palms, climbing straight up from sixty to one hundred feet before they burst out like perpetual Fourth of July fireworks in feather-like showers of green leaves, are frequently noticed in Hayti, sheltering a Negro hut and a mango tree beneath them. The mango tree resembles the American peach tree although it is more luxuriant in foliage. The mango fruit is a delicious oblong handful somewhat like the peach but too delicate for shipment north in commercial quantity.

The story is told of the biannual mango season in rural Hayti when the Negro, asleep beneath the trees, awakes only when the fruit falls and strikes his body. Nature and gravity wake him and feed him and then he lolls back and continues to sleep the untroubled slumber of the tropics. Economic conditions, labor unions, housing shortages, the high cost of living, the law of supply and demand have no terrors for him.

The rural Haytian worries little about clothing or shoes. Nature gives him a marvelously warm climate in which clothing is not too essential. At a tender age nature aids this individual to grow an "elephant hide" sole on the bottom of his flat African foot, enabling him to walk with ease over sharp surfaces which would hinder the progress of an ordinary foot clad in shoes. Nature even furnishes the *caille* or house in which he lives. From the rank thickets come poles and sticks which interwoven and daubed with mud make the four walls of the near-African habitation. A thatch of palm leaves is the roof. The work is usually done by the women who, due to generations of revolution and a peculiar disease which is estimated to have killed a million male Haytians during the past fifty years, outnumber the men by about five to one. Of beds in Hayti there are but few. A straw mat on the dirt floor of the *caille* suffices. Blankets are almost unheard of. Nature also brings the Haytian household its table wear to the door. Calabash trees abound in Hayti. Dried and cut in two the fruit furnishes the bowls and dishes from which the rural Haytian eats.

Buying an orange at an American fruitstand is high finance. Shake an orange tree in rural Hayti and the first sensation is reminiscent of the late disturbance in certain parts of France. And otherwise, if you are a good bargainer, you may buy oranges at any village market at the rate of ten for a cent.

Plantains, a species of banana, grow in great profusion and furnish the Haytian mass with a delectable food. Bananas as Americans know them are not so plentiful.

The average American pays immense prices for furniture covered with a thin veneer of mahogany. In Hayti you are privileged to sit on rough fences hewn from mahogany logs and look into the boughs of mahogany trees, growing wild and unattached. Lignum vitae, one of the most precious of woods, is a common find in many districts. Dye woods, which form the basic vegetable dyes, are the nucleus of a large and prospective industry.

At Grand Goave and Petit Goave, villages of the southern peninsula, I found relics of the days when the French had developed the region into the cultivated garden spot which provided bountiful produce for export to France. At Petit Goave, an aged cannon, lying where it had fallen from its mounting, perhaps generations ago, bore the name of the famous Creusot gun works of France. Again at Petit Goave were found ancient cannon bearing the coat of arms of England, possibly captured by the French in the sea wars of earlier days.

The black slaves of Hayti tilled the fields in those affluent times. Left eventually to their own devices they have let nature take its own sweet course. Nature still needs the hand and direction of the white man in Hayti. Hayti needs its General Wood.

Can the United States afford to abandon its pledged task to aid in the commercial and agricultural development of Hayti? It is a fair-sized problem for Washington to decide. Latin-America is an interested spectator.

This is the first of several articles on conditions in Hayti. Another will appear in an early issue.

A Jew Sees His People as Others See Them

"I Would Like to Hear Your Opinion of Your Fellow Jew After You Have Spent Twelve Months in America."

THIS week we present another Jew's comment on his race and for the good of the race. Bert Levy has said these things before Jewish Women's Councils and B'nai B'rith lodges, and they will assist readers of this series to an understanding of some of the truer, though minority, influences which are at work in American Jewry. He sincerely exposes every obvious defect, and it is to be hoped that one day, with as sincere a pen, he will go deeper. Mr. Levy's chosen title is:

For the Good of the Race

FROM a far-off land I came, a sad-eyed, pale-faced, poetic young Jew, with an unspeakable love of my people burning in my heart. Of Polish-Russian parentage, there was implanted in my nature an indefinable sorrow (born perhaps of my father's and mother's persecution), which left me high-strung and sensitive to the anti-Semitic taunts of my schoolmates.

Given to idle dreaming by some old abandoned shaft or roaming the deserted alluvial diggings of the little mining town of my youth, I would conjure up visions of that new world I had so often read about—that great country where there was no prejudice against my race—the New Jerusalem.

Shyly hugging to my breast some borrowed American book or magazine I would seek the shadows of the huge decaying poppet legs and dream over the pages containing many Jewish faces, and I read with pride and gratitude of the high places occupied by my people in music, art, literature and the drama. Filled with Jewish names and good Jewish deeds was the story of this new Zion, and a longing to be among the great ones of my people took possession of me. Between my dear father and myself there was a bond of love too sacred for words, and when I looked upon his dear face for the last time in this world and bade him a sorrowful good-by before my departure for the New Jerusalem, he held me close to his breast and whispered:

"Don't forget that you are a Jew, and if you need sympathy, love or help, go to your own race and show your Arba Kanfoth." (According to Deuteronomy XXII., 12, the Jews are commanded to wear fringe upon four corners of their vestures and this command is observed to the present day by wearing a special garment with these fringes, generally hidden by the ordinary clothes.)

An Educated American Says Two Things

I CARRIED my father's words across the ocean in my heart and the memory of his tear-dimmed eyes and the pressure of his big loving arms has never left me; in fact, it is so strong at times that I find it hard to believe that he is not by my side telling me, in spite of many disappointments, that after all, the Jews are still my brethren and sisters.

Words fail to describe my feelings as the beauties of the New World unfolded to me. In wonderful contrast to the melancholy aspect of my own country was the joyous color of Samoa, with its hallowed memories of Robert Louis Stevenson, lifted like some fairy veil out of the midst of the Pacific to give me a glimpse, as it were, of my dream of America—the New Jerusalem.

Oh, the wonderful days and wonderful nights out on that vast blue expanse, where God and His stars seemed so near that one formed a good resolution with every throb of the great engine far down below. On one of those nights I sat listening to some one playing in the music salon and I was inwardly thanking the Creator that there was a Puccini in the world and that he had given us "La Boheme." There we were thousands of miles from anywhere, languidly rolling under a perfect moonlit sky, listening to the plaintive airs that Puccini had coined for Mimi. There was hardly a sound but the gentle lapping of the waves breaking against the vessel's side till a slight commotion on deck up ahead caused some of the listeners to investigate. One of the passengers, an ex-Harvard man, returned with the remark:

"Oh, it's only some damned Jew. He's fallen and hurt himself pretty badly."

Like a smudge on some beautiful picture was this anti-Semitic sentiment on such a night, and considering its source I felt deeply grieved. As I was the only other Jew in the first cabin I made my way to the stateroom where they had carried the victim of the accident and found him to be a tender-hearted old man who I subsequently learned had spent a long life in acts of charity toward his fellow men and women, regardless of creed. He was returning to end his days in Jerusalem (his Jerusalem, not the one of my dream), where he could touch again the beloved stones of the wailing wall.

Something in the old man's face, that "something" which was in the face of my father, my brother, that "something" which is in the face of every Jew, drew me to him, as it has drawn me to all Jews always, and I spent many intellectual hours by his bedside, picking up grains of wisdom which he had translated from the Talmud. I wished that the ex-Harvard man could have known that the old man's wrinkles were but the pathetic records of the massacres of his kith and kin which he had witnessed in his homeland and that he daily prayed for death to efface the awful memories.

Later on the ex-Harvard man asked me to join in a deck game. I reminded him that I also was a "damned Jew."

"I'm sorry," he said. "I know what you refer to—that was an unfortunate slip I made the other night—merely a figure of speech, I assure you."

I found him a charming companion and soon in a cozy corner of the smoking room we became fast friends and I tried to win him over to think better of our people.

"I would like to hear your opinion of your fellow Jew after you have spent, say, twelve months in America." he said.

First Meeting With the American Jew

SINCE then I have walked the length and breadth of the great cities of America, and my very soul has cried out to my fellow Jew: "Suppress Thyself!" The day I arrived in New York I learned that my dearest friend, my father, had passed away, and naturally my first thought was to say the kaddish, a prayer of the Jewish liturgy recited by orphans for the welfare of the souls of their deceased parents, somewhat after the fashion of the Catholic mass. Every male of Jewish blood at some time of his life recites this beautiful prayer. It does not matter how far one strays from the fold or how much one has denied the faith, there comes a time when the Jew in him asserts itself and he says the kaddish.

Public prayer among Jews can only be recited in the presence of ten males above the age of religious maturity, and this assembly is called minyan. Surely in this great city I would easily find a minyan, I thought; so I followed the line of least resistance, like any stranger in a strange land, and sought out the Jewish names best known to the public. I called at a business house uptown with the name of a great Hebrew over the door. He was the great man of whom I read with such pride in the little mining town at the other end of the world. Yes! The same Jewish face depicted in the huge photograph in the lobby I had seen in the magazine I had hugged so lovingly at home.

I made my way, full of hope, to his office and was asked by a doorkeeper my mission. I explained—the doorkeeper was a Hebrew—that I desired to say kaddish for my father and that I wanted to form a minyan. With a sly wink he passed me on to several Hebrew clerks and office boys, each of whom smiled, sneered, and made his little joke about "greenhorns." Then I was ushered with many grimaces into the presence of the big man.

"Suppress Yourselves for the Good of the Race"

JUST a minute's conversation convinced me that he was a Jew in appearance only, and that he had never known anything of the traditions, the romance, the art or the literature of our race. He didn't exactly know what minyan was, or pretended he didn't, but recommended me to "one of our people," as he put it, who ran a very popular chophouse close by. I began to realize that I was a stranger among my own people and that night I walked the streets of great New York with an aching heart. Everywhere in the hurrying crowds I saw the faces of my brethren and sisters, thousands, hundreds of thousands of them, hurrying, pushing, shoving brethren they were, with all the tenderness, the friendship and the Semitic look gone from their eyes.

"Oh, God!" I thought, "are these the children of Israel? Is this the persecuted race—that people who had been scattered to the four corners of the earth?"

Hungry and weary I made my way as if in a dream to the café of a great hotel. Everything in the huge room was glaringly false—marble pillars, oak beams, flowers, were all imitation: a big orchestra sat in a balcony with an artificial moon and a painted sky as a background; everywhere were lights, lights and more lights.

From table to table I went but I was roughly reminded that "this" was reserved and "that" was reserved. Presently glaringly gowned, bediamonded Jewish women, accompanied by equally vulgar Jewish men, filed in and occupied every seat, and between mouthfuls of food and drink their bodies would sway to the voices of other Jews who sang only of "Mississippi" and "Georgia." How these people did laugh when they caught sight of my foreign clothes and my pale, poetic face, and how they would have screamed with laughter had I shown them my Arba Kanfoth, that beautiful little token which my poor father fondly imagined would have made me understood in the New World.

Out into the night I went and found myself struggling in a torrent of humanity. Every time I received an extra bump or hard push I looked only to see that my antagonist was a Hebrew. On the street, in the cars, in the subway, or at the soda fountain, wherever I saw my fellow Jews blatantly shouting and rudely pushing, I, in spite of my indignation, felt the love of my race uppermost in my heart, and I wanted to cry out:

"Oh, Jew; dear brothers and sisters, suppress yourselves for the good of the race! Stand back! For the good of the race!"

Never in the world have our people known such a free country as this, and it is a privilege to be here, but at times a great fear comes over me that we are abusing that privilege. Amid the din of Jewish music and laughter, the newsboys are shouting the names of Jewish murderers (the Rosenthal case), the gunmen of the city. The bribe givers and the bribe takers depicted in the news sheets have Jewish countenances. The gambling house keepers—yes! yes! I know that there are Christians who are murderers, gamblers and informers, but the Jew is a marked man. He is distinct, apart, so distinct that in a crowd he is the first noticed.

It is for this reason that I would have my brethren and sisters suppress themselves, stand back! I would have real Jews take the worst of a bargain once in a while for the sake of the race. I would have them once in a while give up their seats in public conveyances, behave modestly in cafés, dress quietly, and give up the use of assumed Christian names.

"Why Must a Jew Be in at the Death?"

THERE is nothing so pathetic as the man who, with a Hebrew face, assumes a Christian name. I never go to a public place without wishing that my fellow Jew would talk less and appear less ostentatious. When one Hebrew comes in late to a show, marches down the aisle and on the front row deliberately obstructs the view of people in the audience as he stands slowly removing and folding his coat and gloves, he seems to cause more annoyance than if half a dozen Gentiles did the same thing. When a Jew stands aside and waits patiently at a ticket window, gives his seat to a lady on a street car or behaves in a refined manner in any walk of life, he immediately makes friends for our people.

Most of our people, I have found, have aggressive personalities: it is this aggressiveness which has enabled many immigrants to pass through Ellis Island to the ownership of fine apartment houses all within a couple of years—but sometimes this aggressiveness becomes absolutely cruel, crushing from the very soul all the tender elements which go to make up a happy life.

Recently I thought with much bitterness of my father's last words to me: "If you need sympathy, love or help, go to your own race." Ill-health overcame me and I became involved in debt for a trifling amount. Each stage of my embarrassment and consequent suffering was contributed to by a brother Jew. First, the shyster lawyer, without principle or mercy, then his brutal clerks, sly and grafting. Next, a collector, absolutely callous, then the process server, and, at last, the "bouncer," sans heart, sans soul, sans everything.

If all these agents of misfortune were Gentiles I could have borne it, but the greatest heartbreak of all was the fact that one and all of them were brother Jews. Why must a Jew always be in at the death, as it were?

There came a time soon after this when I walked

the streets almost penniless. Seeking work, I applied at the store of a wealthy Hebrew. I explained to the well-groomed proprietor that I was an orthodox member of his race and appealed on that ground for a chance. He pooh-poohed the idea.

"My dear fellow," said he, "these are the enlightened days, when Judaism is not taken seriously, in fact, it doesn't pay. I am a Christian Cultist, I meet nice people and it helps my business."

Here was a poor fool with his head like the ostrich's—in the sand. I explained to him that being a Jew was not a question of religion but a question of blood. I told him that if a Jewish leopard ceased visiting the synagogue to go to a Christian Cultist chapel it did not necessarily get rid of its spots. I left him scratching his head, and I also lost the chance of a job in his store.

In and out of offices presided over by men with Jewish faces I trudged all day. Most of these men, I subsequently learned, belonged to New Thought, Christian Cultist and other up-to-date churches and societies—it was good for their business. They called themselves Christians, but nature's marks cannot be changed like one's clothes.

The Jewish Custom of Cover Names

IN THE great theatrical districts I found thousands of my fellow Jews who had grown rich over night by coining perhaps a popular song that had pleased the cabaret-mad crowd or by ridiculous impersonations of their race upon the music hall stages. A good many of these were young men, sons of fathers and mothers who had been driven from their own country with fire and sword.

The mothers and fathers stay at home blessing God every hour of the day and night for guiding them to such a country as this, while the sons and daughters are out at the theaters, in the halls and cabarets singing songs of Dixie. Passing by in this great throng are prominent actors, critics and playwrights, many under assumed names, simply because their own names are Jewish.

Flashing across the horizon as I write is a notorious Jewish doctor with a consumption cure. He could have been famous and honored had he but suppressed himself, instead of which he, with his commercial instinct and his press agent methods, made more enemies for the race. Many Gentiles, I will admit, have had consumption cures, but it remained for one of our people to float companies and open institutions before the "cure" was even reported upon by the government.

Tramping the city tired and weary of looking for friendly Jewish faces I found myself near the City Hall. I approached a milk station and bought a cent's worth of the most delicious milk I have ever tasted. A rough-looking fellow next to me said, as he smacked his lips:

"Pretty good stuff, that," and perhaps noting that I was a stranger, he added: "The guy who is doing this milk thing is saving the babies all right—he's some rich Jew—God bless him—I've got three babies of my own."

Hungering to hear a Jew praised I talked with this man for an hour, listening with keen enjoyment to the story of one of my race who had caused his millions to do good for the people irrespective of creed, and had kept himself suppressed. I learned of this Jew's efforts for the dying babies at home and for his starving co-religionists in Palestine and felt proud. Proud and happy for the first time, I sat in the little park watching the passing procession till I dozed off into a sound sleep. My happiness continued in my sleep, for I had a most beautiful dream.

A Vision of Jewish New York

BEFORE me in my dream passed a grand parade; it was a series of "For the good of the race" tableaux. All the prominent professional Jews headed the procession with their real names and the name of their race emblazoned upon silk banners in letters of gold. Then came all the Hebrew gambling house keepers bearing aloft broken roulette wheels and other emblems of a discarded and disgraced "business."

Next in order was a large army of Hebrews who were professional bondsmen for arrested street walkers headed by two crooked ward politicians carrying a huge streamer with the words: "Henceforth we will go to work." These men looked a little sad as they marched along thinking of the easy money they were leaving behind, but the cheers of the multitude exulting over their great sacrifice somewhat atoned for their agony of mind. Next followed the amalgamated Jewish usurers, real estate and company promoters' union. This part of the parade took four hours and a half to pass a given point.

All the marchers had discarded their expensive clothing and their diamonds and were modestly attired. They had also discarded their automobiles—many of the prominent men in this section carried flags and banners upon which were inscribed the legends: "We will not lie about values." "We will not charge exorbitant interest" and "We will not water our stock." These inscriptions were received with incredulous looks of astonishment, and many of the crowd called out: "We're from Missouri," whatever that meant.

Then came a beautiful torchlight brigade called "The Hebrew Firebugs' Union." Nearly all these men had their hair close-cropped and wore prison clothes, a fact which filled the crowd with relief. Next came that part of the procession which showed the greatest following among its marchers. It was the large army of Hebrew "aggressives." Hundreds and thousands of them passed by with reformed looks upon their faces. Oh, I felt so happy as I read the buttons they wore and saw the flags they carried. Most of the streamers read: "We will suppress ourselves." "We will stand back and keep quiet." "We will be unostentatious." There they were, hundreds of well-known faces and types—end-seat hogs, front-seat hogs, loud talkers, inconsiderates, bargainers and the terrible army of people that go to make up the crowd which is directly responsible for the anti-Semitic feeling. The line of them was miles long.

I was awakened from my happy dream by a rude thump from a Jewish policeman who hurried me to a police station, where I was surrounded by shyster lawyers, my brethren, who wanted money with which they could square other brethren. I could not gain the services of a Hebrew bondsman because I had no pull. A Hebrew magistrate called me a "bum" and a loafer for going to sleep in a public park.

"Keep awake in the future," he said as I was roughly bundled out of the court.

Keep awake! This is the worst advice he could have given me, for I was so happy asleep and dreaming that my brethren and sisters had reformed and had become real Jews for the sake of the race.

I now look upon my police court humiliation as the best thing that could have happened to me, for a kindly old Jewish scholar, who acted as court interpreter, was attracted by my appearance. His long contact with human misery and his great experience with foreigners stranded in a strange country enabled him to understand me.

Meeting a Jew of the Old Order

THAT night he took me to his poverty-stricken little room behind a delicatessen shop in the Ghetto. After supper he went to the street door and called the neighbors from their stoops. He called them by their first names and I said kaddish for my father as they stood around among the pickle barrels.

Since then I have lived among Jews, real Jews. I have learned that beneath the ragged coat of a push-cart vender there may beat a heart of gold, and that a poor seller of collar buttons or suspenders may be a student of the Talmud with a mind that is a gift of the gods.

Leaving the seething, modern, fashionable life of upper Broadway to enter the religious atmosphere of the numerous schools of Jewish literature on the East Side entails a violent contrast in conditions.

To see the deeply furrowed, time-scarred faces of the grand old men pouring over their beloved Talmud is to get a glimpse of another world—a world of resignation, peace and love.

Within earshot of the thundering traffic of Broadway I stood gazing at the bowed figures engaged in study and prayer. As I gazed the sordid walls of the poverty-stricken room faded from my sight, and in their stead I saw (in my mind's eye) the wailing wall of Jerusalem or some ruin of the Holy City—a more fitting background to the rabbinical figures so strangely out of place in hustling Amercia.

The great passion for the dead and gone past reflected in the Rembrandtesque faces of the aged students lends to their lives a religious grandeur which the uptown tourist (hastily passing on a rubber-neck wagon) would never suspect. Behind many a shabby-looking little store, or maybe above some corner saloon, are the societies for the study of Hebrew literature, where congregate the types of Jewish scholars and philosophers that make the heart of the writer and artist glad.

Gray-haired, bewhiskered, sad old men, many of whom have tasted only the bitterness of life—yet such is their faith in the Almighty that they cling to the praying shawl and Bible to blot out the memory of a Kishineff—their lives of study and prayer amid abject poverty giving the lie to the fallacy that the Jew lives but for money.

The Quality of Jewish Sainthood

I HAVE often wandered among these scholars picking up the crumbs of wisdom which fall from the lips of the old men, grateful that my Jewish face and blood gave me the privilege to sit and sketch among them. Somehow or other my ramblings on the East Side are like the calm after the storm of the uptown struggle.

Many times I have felt the heart tug—the longing to be among my people—the real Jews—and, leaving theatrical uptown, the land of make-believe and unrest, I have sought the little schools of study where the wonderful real old men who live by optimism and nourish their souls by faith teach me the lesson of patience and the love of humanity.

There is something restful and inspiring when an old man—long, long past the Biblical three score and ten—places his hand on your shoulder and murmurs in Yiddish, "It is God's will." I have envied the profound peace of many of these aged students living in the past and undisturbed by thoughts of the future. Their Jewish view of life is as beautiful as it is simple. It disregards neither earth nor heaven. It looks to earth and observes the evil prevailing among men; it thinks of heaven and ponders on the bliss of "the future state," and it urges man to strive to bring heaven on earth, to establish by justice and equity those blessed conditions on earth which so many associate with heaven.

Their Jewish view of death is equally beautiful. For those who die they feel no sorrow. Having once torn aside the veil which parts the known and the unknown, having once entered into the shadow, or rather the sunshine, of the beyond, they are better off in the other life. Whether death means eternal sleep or eternal life, those who have left our side, having passed into the arms of pitiless death, repose in a condition which should give survivors no cause for anxiety on account of their beloved dead.

In the pathetic chapter of "The Old Curiosity Shop," in which Dickens tells of the death of Little Nell, he makes the Schoolmaster utter these words of wisdom, on which all who mourn for their dead may well ponder. "If," said he, "one deliberate wish expressed in solemn terms above the bed could call her back to life, which of us would utter it?"

Dickens took this view of death from the Talmud.

"The Jew of the Lobster Palaces"

THE interpretation of a difficult passage from the Talmud, or the coining of an epigram, is as food and wine to the wise old students, and there is not an ill in their lives that cannot be soothed or a blessing that cannot be acknowledged in a quotation from their beloved book. To watch them at their study and devotions undisturbed by the turmoil about them is to marvel at the faith which has enabled some of them to live more than one hundred years with no other interest in life than their God and their books.

From the dingy windows of the schools the mass of sordid buildings look to their eyes like the hills of Palestine, and the shriek of the passing elevated trains and the clanging of the car bells and the din of passing traffic disturb them not, for they live in the past.

The alleged Jew of the fashionable uptown lobster palaces—the blatant, pushing type, who is the direct cause of much anti-Semitic feeling—knows and cares nothing for the submerged student of his race. The latter is equally oblivious of the alleged Jew who is contemptuously referred to as a meshumad (apostate). But while the former stands out in the world of money and worldly success as a target for much abuse and hatred, the latter lives with books, unknown and unheeded, drawing from the Talmud a joy that riches cannot buy and solacing himself with the love of humanity.

In strong contrast to their fathers and grandfathers are the children of these old men. Modern America, with its opportunities for all, has torn them from the religious atmosphere and sent them uptown to become the lawyers, the artists and the actors.

The Jewish comedian of the vaudeville theater who nightly sets the audience shrieking at his Yiddish idioms is in nine cases out of ten the son of a scholar, and though the glamour of Broadway success claims him and he no longer lives home, in his heart of hearts he is a Jew and never forgets the old people. He will tell many stories of his parents to his Gentile friends, imitating and exaggerating their many characteristics, but he is mighty sore when he hears a Gentile do the same thing. But, after all, the comic Jew of the modern stage is but an imaginary sketch.

Is This the Jew Who Rules Jewry?

THERE is absolutely nothing humorous in these old men of Judea. Even in the sordid surroundings where you find them engaged in prayer or study, their attitude is one of quiet dignity—a dignity enhanced by their extreme old age.

In a little dark den behind a poultry store I was sketching some of the old men at study. One old fellow one hundred and four years old was explaining to a young fellow of sixty a passage in the Talmud which the latter was in doubt about. Both men were without coats. The younger man had left his push-cart at the door, entirely forgetting the perishable goods thereon and quite oblivious to the fact that hundreds of dirty children were surrounding his cart and fooling with his wares.

Other old men were in the school, and the background to their somber faces was the shop with its ghastly poultry suspended by the necks. One of the old Talmudic students would now and again leave his ponderous Bible to serve in the shop, returning, after wrapping a fowl in a newspaper, to the verse he had been propounding. There was absolutely nothing humorous in all this, but I would love to have had some of my non-Jewish friends see how little thought of money and business the real Jew has.

Sometimes when I have felt full of shame at the behavior in public places of men and women with Jewish faces but with no Judaism in their hearts, I have wished that the simple, studious lives of the old men of the East Side could be the standard by which our race is judged, and that the Talmudic saying so aptly put into verse by Rabbi Myers was better known:

"Which is the path, both right and wise,
That for himself a man should find?
That which himself much dignifies,
And brings him honor from mankind."

Blackfeet Glacier, Glacier National Park

Mother Nature's Ice House

By CARL SCHURZ LOWDEN

"FEAR not to try the mountain passes," urged John Muir. "They kill care, save you from deadly apathy, set you free, and call forth every faculty into vigorous, enthusiastic action."

And Horace Greeley said, "Go West, young man, go West." Evidently the orator-journalist considered the western half of the nation the land of opportunity, wealth and health. It was good advice then, and it is good advice today. Seekers after the "Fountain of Youth," which old Ponce de Leon sought in Florida, can find it in the West by claiming and proving kinship with the free, open, high places of the broad outdoors.

But how far west? Cross the wheatfields of the Dakotas, enter Montana, cross most of it, but stop in the spot bounded on the east by the Blackfeet Indian Reservation, on the north by Canada, on the west by the Flathead River, and on the south by Bear Creek. It is fifteen hundred square miles of craggy heights, primeval forests, blue lakes and gaunt glaciers with a climate all its own.

Here in Glacier National Park, exceeded in size only by the Yellowstone Park, one can escape that prize foolish question, "Is it hot enough for you?" Instead, if that section of our country should ever adopt a motto it could truly be, "Even in July and August we sleep under blankets at night." At an average elevation of a mile and a half and an aggregation of sixty to a hundred glaciers nobody can justly complain of the heat.

Here Mother Nature has her refrigerator. I don't know why she should put her teakettle on in Yellowstone and locate her ice-box in Glacier—seems an unhandy kitchen grouping to have them two hundred miles apart—but nobody understands all of the old lady's whys, whims and wherefores. She never worries about paying the ice man. Her huge ice cakes melt in summer and feed the numerous waterfalls, rivers, and lakes; but in winter all that was lost comes back in the form of snow and sleet. It's a fine automatic system she has.

Perhaps the biggest ice cake that Mother Nature possesses is Blackfeet Glacier which contains many tons and has an area of from three to five square miles. It is centrally situated among the snow-capped peaks and trout-containing lakes where the Blackfeet Indians, also the Piegans, hunted and fished long ago. It was their very own playground then; it is ours now, as we have shoved them eastward.

None but hardy souls accompanied by a competent guide should attempt to make a "close-up" inspection of a glacier. Ice is always a slippery proposition. Every glacier has its quota of yawning chasms ready to receive victims. The guide should have belts, creepers, ropes and emergency equipment. Each member of the party should have an alpenstock six or seven feet long which, in case of a fall, should be thrown across the crevasse to stop the unwanted descent.

Though Blackfeet must be given the championship of the park in the matter of size, it can boast an elevation of a bare seven thousand feet. Its rival, Sperry Glacier, has a height of nine thousand feet and the water drops picturesquely a third of this distance into Avalanche Basin. The exploration of Sperry entails a stout climb much less dangerous than the trip to Blackfeet, yet sufficiently full of thrills for the visitor.

"I know of no one spot in the wonderland park where the tourist can get so much for so little as in the Sperry Glacier region," said William T. Hornaday, eminent naturalist, after he had been there. "On the short jaunt from Lake McDonald you can get a mighty good series of samples of Glacier Park. There is the lovely green timber, the Sperry Basin, the view of Gunsight region, Lake Ellen Wilson, the glacier itself, and Avalanche Basin into which the glacier's water falls. You can climb down directly from the glacier to Avalanche Basin; but it is a dangerous and difficult task, and good guides advise against it. It is best to take horses at the Glacier Hotel and ride to the basin; but on a dripping day you want all the waterproofs there are in the whole world."

There is something strangely attractive about conquering the goat trail to a glacier, getting on top, and looking down into the broad, fearful cracks. After that experience a person feels he could conquer anything. He likes to pick off a sliver of ice and hold it between his teeth for a moment or pelt his comrades with snowballs. What a feeling of exhilaration he gains, a sort of linking of the vast past with the present, as he recalls some book of geology in which he has read of the Laurentian Period and how the glaciers smashed, crashed, or swallowed everything in their path. Exultantly he realizes that he himself, a pigmy man, has his feet on top of the giant.

Iceberg Lake in the Many Glacier region is a queer combination of lake and glacier. This miniature polar sea, not more than half a mile across, is surrounded on three sides by near-vertical walls three thousand feet high. The fourth side is a grassy spot where wild flowers grow. On a mountain shelf lies a glacier from which huge pieces of ice break off and fall into the lake. When the sun's rays strike these floating icebergs, a glorious array of prismatic colors make the eyes glad; and one almost believes himself in fairyland. The lake is the only one of its kind on the American continent.

In the park there are two hundred and fifty lakes of all sorts and sizes and conditions. Some are long like ribbons, some are round, others are irregular; there are deep ones, shallow ones, sapphire ponds in mountain pockets and silvery strips in narrow valleys. The settings vary; one may be a shimmering jewel in a green forest, another has a grassy shore, its nearest neighbor may be rock-bound. Most of the lakes, however, are combinations or mixed types. The two main types are the deep, sea-reminding kind of which McDonald is an example—the big fellows—and the gems like Gunsight and Ellen Wilson, exquisite tiny bits too small for navigation.

Lake McDonald is ten miles long by one mile wide, the largest in the park. Wooded hills surround it; beyond these the sentinel peaks, Vaught, Canyon, Edwards, Brown and Stanton, look down into this one of Mother Nature's mirrors. With the brilliant blue sky above and its own vivid blue beneath, it strikingly resembles the far-famed lakes of Italy.

Melting ice and snow from Blackfeet Glacier feeds Lake St. Mary, which the Indians knew as "Good Spirit Woman Lake." It is shaped like a crescent, lined with spruce and pine, and guarded by Red Eagle, Fusillade, and Going-to-the-Sun Mountains. Its trout can be caught by trolling from a rowboat. As it has a length of ten miles, though narrower than Lake McDonald, it qualifies as the largest body of water in the eastern section of the park.

If you would see a pearl sunk in precipitous walls—a water pearl of wondrous beauty—look down upon Avalanche Lake in Avalanche Basin at the head of Lake McDonald. Four to half a dozen waterfalls may be seen tumbling down from Sperry Glacier; these, and the halo of purple mist that often envelops the lake, constitute the chief charms of this mile-long ellipse.

Three lakes in a row in the southeast derive their names from the Two Medicine River that links them together. The western one is Upper Two Medicine, the middle one is just plain Two Medicine, and the eastern brother, though farthest north, is Lower Two Medicine.

There are several versions of the Indian legend whereby this odd common name originated. It seems that the Blackfeet Indians could not agree and that they separated into two factions each of which erected a medicine lodge to obtain the favor of the Great Spirit. At that time the red men were gripped by famine. Perhaps the two lodges were doubly effective so that the crops were unusually bountiful the succeeding year. At any rate, the two rude shanties built on the banks of the same river and at a comparatively short distance from each other proved a fruitful source of nomenclature.

On the north shore of Two Medicine Lake is Rising Wolf Mountain, the Blackfeet monument to Hugh Monroe, the first white man to set his foot on Montana land. The Indians adopted this Scotch-French employe of the Hudson Bay Company, and he married one of their women, thus becoming a "squaw" man. The redskins called him "Muck-qua-ee-poh-wock-sin" or "Rising Wolf" because he had the strange habit of getting up quickly in wolf-like style whenever he was awakened. It is said that he always slept so lightly that nobody could catch him napping; here again he was like the wolf.

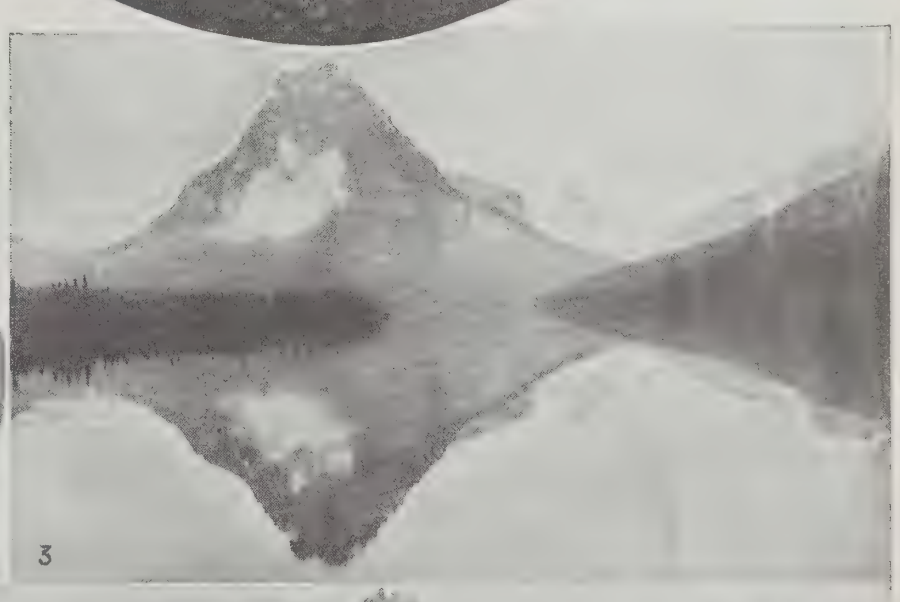
At that time some of the peaks were unnamed. Monroe desired to have his name bestowed upon the highest. Neither he nor the Blackfeet knew that the peak they selected was more than a thousand feet lower than Mt. Cleveland, the highest in the park as it rears its head heavenward almost two miles. Mt. Jackson, approximately ten thousand, exceeds Rising Wolf by seven hundred feet.

George Bird Grinnell, who is really the father of the park as he first broached the idea of setting it apart, has been honored by the naming of a lake, glacier and mountain after him. He gave Single Shot Mountain its name because he once killed a mountain goat there with one bullet.

Would you believe that there is any spot in the entire sprawling American continent where you can send a cup of water three ways to the sea? Just that spot is found on Triple Divide Peak, one of the eighty-seven in Glacier Park with an altitude of seven thousand feet or more. Part of the water goes to the Red Eagle on its way to the Arctic Ocean, some flows to the Cutbank and thence to the Gulf of Mexico, or the Atlantic, and the remainder trickles to the Nyack whence it proceeds through the Columbia River to the Pacific.

The animal life in the park includes the Rocky Mountain goat. Guides seems to take a peculiar delight in "working" the inexperienced tourist and "egging" him on to see goats where they "ain't." If the patch of white pointed out on the mountain side moves, the object is a goat; if, after patient inspection or observation, it fails to move, the viewer will find the goat in his pocket mirror. A bear is not an unusual sight, although there are none as tame as those in Yellowstone Park. Some coyotes and a few mountain lions remain; of the latter a few are too many, as just one can make the entire night hideous with his howlings that sound like a human in distress. Occasionally a gopher may be seen or the whistle of a marmot heard. The beavers industriously build dams in the creeks, sometimes deepening the channel to such an extent that parties must detour to find a safe fording place. Because of Glacier Park's high altitude there are no snakes and scarcely any birds.

Would you expect to see flowers in Mother Nature's ice house? It is a veritable flower garden with sixty or more varieties peeping from the crevices in the rocky places and the rich soil of the morains that fringe the glaciers. I cannot name them all, just a few such as violets, larkspur, daisies, ferns, clover, lilies, daffodils, buttercups, gentians, harebells, marigolds, asters, forget-me-nots, clematis, and the lady's slipper.



"Give a month at least to this precious reserve," John Muir counseled in speaking of the grandeur of Glacier National Park. "The time will not be taken from the sum of your life."

A National Emergency in Education

What Chance Have You?

DR. PHILANDER P. CLAXTON,
United States Commissioner of Education

The United States in education occupies NINTH place.
With no schooling, of 5,000,000 only 31 men attained distinction.
With elementary schooling, of 33,000,000 only 808 men so arrived.
With high school education, of 2,000,000 only 1,245 men arrived.
With college education, of one million 5,768 men attained distinction.
In some states attendance is so poor and the school year so short that to complete eight years of schooling of 200 days each would require 22 years!
If the pupil started at six years of age, the eighth-grade certificate would be granted at 28 years of age.

By PHILANDER P. CLAXTON,
United States Commissioner of Education

WE ARE the oldest of the democracies of the world. The world looks to us not only for theory but for example. It will require a high degree of political and civic knowledge and wisdom to enable us for the next generation to walk the sane path of democracy between extreme reaction on the one side and class government and anarchistic disintegration on the other. Both tendencies are strong in the world today. In one form or another they are found everywhere.

For our political salvation it is necessary that we educate in larger degree than we have ever done. That there may be culture for the great mass of the people it is necessary that we shall not only extend our education, but that we shall readjust it to the new conditions that are before us.

But we are facing a national emergency. The nation will have to spend two or three times as much money as it is now paying for education. With more than 100,000 vacancies assured in teaching positions in elementary schools in the United States the present year, there will be only 30,000 graduates of normal schools and other teacher-training institutions to fill them, making it necessary to employ 80,000 new teachers who have had no professional training.

There is a national significance in this shortage. It comes at a time when the nation can least afford to neglect education. New conditions require that the schools shall be more efficient and more effective just at a time when there is danger that they may not be so effective as in the past.

The Committee on Education of the House of Representatives recently submitted a report that the United States in education occupies ninth place, "with most of the civilized nations ahead of us." Another report shows that with no schooling of 5,000,000 men only 31 attained distinction; with elementary schooling of 33,000,000 only 808 attained distinction; with high school education of 2,000,000 1,245 attained distinction; and with college education of 1,000,000, 5,768 attained distinction.

What is one's chance, therefore, without education?

The census of 1910 showed that the total number of white illiterates had increased in the United States during the 30 years prior to that time. White illiterates in the United States in 1910 exceeded in number 3,200,000 persons, and Negro illiterates 2,180,000.

There were 5,000,000 foreign-born residents in the United States who could not read and write English. There were 2,000,000 who could not read or write any language. There were 3,500,000 who could not speak or write English.

The first draft in the recent war disclosed the startling fact that one-fourth of the young men called to the colors could not read a newspaper intelligently or write a letter. Of the total draft, 700,000 were illiterates. Of our boys called to the colors, the ages being from just below 20 to just above 30, one in six was an illiterate. Many others could not, because of a lack of a common medium, respond intelligently to military or industrial orders on the one hand, and to moral and spiritual appeals on the other. This fact should arouse every citizen to the magnitude and importance of the problem as nothing else has ever done.

These facts are startling. They "should shock our national conscience."

Yet those are not all of the shortcomings. Let us turn to the present condition of the teaching body of the United States. The average pay of teachers does not exceed $650 a year. Our people have been willing to spend billions and make all necessary sacrifices for the winning of the war, but they have not been willing to make sacrifices for the education of their children, nor have they believed it to be necessary.

As a result five millions of children are today either out of school for lack of school facilities or are being taught by teachers who ought to go to school.

It is true that children of the United States—and there are more than 20,000,000 who spend a large part of their time each year in public or private schools—are in school less than four per cent of their time from birth to their twenty-first year. In some of our states the attendance is so poor and the school year is so short that to complete eight years of schooling of 200 days each would require 22 years! If the pupil started in at six years of age, the eighth-grade certificate would be granted at 28 years of age.

And it is well for us to remember that the United States has the shortest school year, the shortest school week and the shortest school day of all the highly civilized nations of the world.

The special need for provision for extension education on a large scale in the next few years is indicated by the following facts:

That of the 4,000,000 recently discharged soldiers, nearly all of whom are eager for opportunities to extend their education for vocational efficiency, for citizenship, and for general culture, few can go to college, and fewer still will enter ordinary high schools. Practically all must depend on such opportunities as may be offered by extension agencies;

That millions of laboring men and women now having shorter hours and receiving better pay than ever before are eager for opportunities for instruction, especially in things pertaining to economics, civic rights and duties, and better living;

That millions of women, recently enfranchised, are eager for opportunities for instruction in regard to forms of government and civic and political problems;

That millions of foreign-born men and women among us both those who have taken out citizenship papers and those who have not, although able to speak, read and write the English language, need to be instructed in regard to the geography, history, ideals, manners and customs and industrial and economic opportunities in this country;

That two and a quarter million boys and girls are every year attaining their majority and entering the ranks of active citizens with the right of suffrage at a time when the problems of citizenship are more numerous, complex and difficult than ever before in our history. Few of those have had any adequate instruction in the principles of democracy and in regard to the vital problems with which they must deal. Less than one-third of them have had any high school education and less than one-eighth have graduated from a high school.

To respond effectively to the opportunities and needs for extension education thus indicated Congress should make an appropriation for the maintenance of a division of educational extension; also, for co-operation with the states in promoting extension education in health, trades, industry, civic duties, and general culture.

I believe that the people are eager to do all they can to eliminate illiteracy, to develop youth, to give everybody a full opportunity to arrive at the full stature of manhood or womanhood.

In our democracy we have always set a high value on education and more and more on the public schools. The public school is, indeed, the most distinctive agency of our democracy. Fifty years ago we spent for public elementary and secondary education $63,000,000. Last year we spent more than a billion dollars, fully sixteen times as much, although the population has increased only about threefold. This indicates the growing faith of the American people in education.

In the Light of the London Conference Concluded from page 2

Mayhap it needs to be so. Mayhap not even the heart of God could do more with a civilization so materially minded as ours, so lost to truth and faith, and with leaders so sodden in corruption, so imbecile in decision and action, as those that now direct the destinies of the dying nations.

VII.

Now all this has a profoundly penetrative and predestinative effect upon the choices and destinies of America. The French have been clever enough in their calculations as to the effect of the London rupture with Germany upon American public opinion and diplomatic action. By so maneuvering as to mask their determination to prevent a settlement with Germany with the appearance of urgent efforts to force a settlement, the French politicians have accomplished two things highly desirable to them and their financial masters. The first is, that of placing the American Government in so awkward a position toward Germany that the projected separate peace according to the Knox Resolution must be postponed. Second, under the crafty guidance of that bombastic apostate, Mr. Viviani, an avalanchian propaganda for France will be carried on in America. The first sweeping advance of this propaganda is already far under way. It is camouflaged by a vehement bestirring of public opinion against a hypothetical pro-German propaganda in the United States. The American public is now made to believe that a profound and pervasive pro-German campaign is imperiling America's national integrity.

Now this proclaimed pro-German propaganda is nothing else under the sun than the prelude of an actual and exceedingly corrupt French propaganda, financed by certain international gambling institutions known as banks and operating between New York and Paris. The shabbiest foreign schemes of certain New York financial groups are carried on through Parisian banking houses. Parisian, for the reason that the standard of honor required in the American financial institutions, such as it is, has no existence in the like financial institutions of Paris. *The soul of French finance is its corruptive power; and the favor in which it is held by certain American financiers is due to the convenience it affords for corruptly procuring concessions and for the carrying on of speculations that cannot possibly be procured or proceed through American or English banks directly. Moreover, this crafty prevention of an American peace with Germany, this intensively cultivated French propaganda in our midst, mobilizing as it does the blind nationalism of young Americans to its standard, is not only destructive to an American knowledge of the truth; it is distinctly destructive to American commerce as well. That commerce with Germany and with Russia which American industry sorely needs at the present time, and which would decidedly advantage American labor just now, is blocked by the French consecration of our stupidity in dealing with both Germany and Russia. The American manufacturer and business man, despite his supposed competence and enlightened self-interest, is being calamitously duped by the Parisian Junta.*

Nor only today; for well on to two years, now, the international policy of our American State Department has been increasingly directed by the French foreign office—which foreign office at least has the merit of having pursued one consistent evil policy from the days of Louis XI till the days of President Harding. And the consequence of this unconscious and even servile subservience of our American foreign policy to that of France is the cutting off of America from what ought to be her redemptive industrial relation to Europe, her both profitable and beneficent relation to the whole planet. We are being seduced by France into a national state of mind, into a diplomatic conduct, that can have no other result than that of rendering both our commerce and our friendship with the nations of the world perditionable.

VIII.

The writer can be accused of no pro-German tendencies or preferences. For years before the war he sought to arouse public opinion in Europe and in America, to the limited extent to which he could reach that opinion, against the Prussian purpose and its peril to civilization. He is on record during the war in numerous books and pamphlets, such as "The Menace of Peace," "Woodrow Wilson and the World's Peace," "Germanism and the American Crusade," "The Greater War." These books had for their purpose the bringing of America into the war upon the side of the Entente and to the defense of France. But the peril that was Prussian has now passed to the French financiers and politicians. It is these who are seeking, both overtly and covertly, by intrigue and by war, to restore a medieval and monarchical Europe; to subject the nations unto the will and the profit of the French concessionnaire; and to destroy the last vestige of honesty, the last hope of democracy, the last basis for co-operation and good will among men. And it is against these that every believer in democracy, every advocate of honor and faith between nations, every lover not only of humanity as a whole but of the French people as well, should today and at all cost take his stand.

A Doctor of Sick Towns Who Cures His Patients

By WILLIAM ATHERTON DU PUY

COLVIN B. BROWN,
Chief of Organization Service Bureau of the Chamber of Commerce of the United States.

IS THE town in which you live an exultant, robust sort of place, or is it ailing, pale and puny? Is it dapper, snappy and well-groomed or is it shiftless and slovenly? Is it happy and optimistic or is it subject to brainstorms and morbid moods? Does it administer its affairs with progressive competence or does it drift, willy-nilly, with the tide?

Unless it is in every way on its toes and hitting the line, it is in need of a doctor to diagnose its case and prescribe the remedy. Even if it appears to be in good condition it is well to have it thumped over and X-rayed for there may be ulcerated centers that are putting poison into its system.

What do I mean, call a doctor? I mean that I know a man whose business it is to prescribe for the ills of towns and cities. He goes about feeling their pulses, making them stick out their tongues, leaving behind his little packages of municipal pills. His name is Colvin B. Brown. He will not profit by the advertising here given him for he charges no fees. He is a part of a great organization, the Chamber of Commerce of the United States and, like the company doctor, he works on salary.

Colvin Brown is a graduate of the school of experience and coincidence. Twenty years ago he became secretary of the chamber of commerce of Stockton, California. Stockton wanted to capture a large number of new settlers. The secretary called the business men of the town together and said to them:

A Municipal Muldoon

"WHAT, if anything, is the matter with Stockton?" The diagnosticians were not particularly skilled but any group of hardheaded city fathers can point to a few obvious municipal needs. These men picked out two things. Stockton had no electric lights. Morman Slough overflowed its banks every once in a while and filled up all the cellars. If the young secretary wanted to show just how much of a municipal Muldoon he was he might work off these ills.

Brown examined into the electric light situation. He found that a great transmission main ran right through the town, carrying electricity for the whole city of San Francisco. The people operating that line were selling electricity all along the line. They would be glad to supply Stockton. In fact there was a contract for power covering the Stockton field. It was held by the same company that furnished gas to that community. The gas business was profitable so the price of electricity was made so high as to be prohibitive. Thus gas maintained its monopoly.

Through the chamber of commerce, plans were made for the erection of a hundred-thousand-dollar electric light plant to be owned by the municipality. An election was held and the bonds voted. The plant, however, was never built. The gas company put the price of electricity where it should have been, improved the service and, with the club of the municipal bond issue hanging over it, became a model public service corporation. This cure was effected at little expense.

Secretary Brown was studying Morman Slough in the meantime. He found that the muddiest sort of water came down it and that it was depositing such quantities of silt in the local deep water channel, maintained by the Federal Government, that the California delegation at Washington had to dip into the pork barrel to the extent of $75,000 a year for dredging. Would it not be cheaper to divert the stream than dredge perennially? Brown went to Washington and convinced the Federal engineers that he was right. A diversion canal with a very large levee on the Stockton side was the result, and the cellars have since been dry.

This was Brown's first experience in town doctoring. He spent five years in New York as the eastern representative of the combined chambers of commerce of California. The four succeeding years were devoted to staging the Pan-Pacific Exposition at San Francisco. Then he accepted his present post with the Chamber of Commerce of the United States where, at first, his work was largely experimental.

There were no textbooks on town nursing and there was little written history. To be sure there were more than 1,000 towns and cities in the United States with organized chambers of commerce. These had been as 1,000 individuals. There was no co-operation, no exchange of ideas. If one made an outstanding success in handling a certain problem, the others were not likely to get the lesson. There had been many individual successes but no method of making the accomplishment of one accessible to all.

Colvin Brown was given the task of recording the successful experiments, the solved riddles. He was to study, absorb, digest the experiences of chambers of commerce. Their yearbooks, house organs, reports, would be helpful. Secretaries were garrulous individuals who would talk of their accomplishments. Expense money would be provided for visiting around.

Thus it was that he completed his training in town doctoring. Thus it was that he became the greatest repository there is for chamber of commerce information. Thus he became equipped to hang out his shingle as municipal adviser at large.

The greatest problem in chambers of commerce is that of support. Therefore, Mr. Brown is asked almost daily: "How can we increase our membership from dues without the necessity of membership drives?"

This is the greatest of chamber of commerce problems. The answer is as vital to the existence of a chamber as is the need of becoming permanently self-supporting to an individual. It is the foundation upon which all else is built. With its solution comes time for constructive work.

Mr. Brown has the prescription which is a sure cure. It is not a mere stimulant as is the membership drive, creating a condition that cannot be maintained. It guarantees steady, strong growth through the years. Here are the directions for taking:

For Steady Growth

INSTITUTE the "continuous solicitation" plan. Under it appoint ten representative members of the chamber. Assign to each the definite task of bringing in ten new members. Pledge each to devote a minimum of two hours a month to this work until the end is accomplished. Furnish each with a list of prospects and allow him to solicit these men only.

This plan works. Ottumwa, Iowa, rounded out the first year of its use with 711 members as against 624. Chicago Heights, Illinois, grew from 48 members to 280 members in nine months. Springfield, Massachusetts, varied the system by sending solicitors out in pairs and was successful. Seattle allowed its solicitors to work only between ten and twelve on Thursdays and got them together afterward for a luncheon at which progress was discussed. Mobile, Alabama, added 125 members to its chamber the first three months after inaugurating "continuous solicitation." St. Paul has given up its old methods of getting members. This new, proved, effective idea is being adopted all over the land.

Members of chambers like this work done this way. It gives a business man an excuse for visiting around and getting acquainted.

When a solicitor has brought in his ten members his name is put on the honor roll and posted. He will never be asked to solicit again. Another man takes his place.

Another accomplishment of this doctor of sick towns has been to look the field over and find the community organizations that are most successful, to study their methods, to learn how they attained preeminence, and to make their findings available to all. There is Middletown, Ohio, for instance. The chamber in that community of 25,000 population represents all its elements. There are 1,200 members of whom 341 are women, 250 are laborers, 120 are farmers. In the beginning one man, George M. Verity, who is president of a rolling mill, got the correct idea of community organization. A chamber of commerce was not a merchant's organization, he held. The welfare of the whole community depended on the condition of its roads, the productiveness of its industries, the efficiency of its schools, the development of its parks. All classes of citizens should belong to its chamber of commerce.

Mr. Brown visited Middletown. A dinner was given in his honor. It was shown that the chamber of commerce is here the center of the community life. Mr. Brown sat beside a daughter of Mr. Verity, the wealthy man of the town. She is a young woman in her early twenties, handsome, socially correct, a director in the chamber. Down the table an elderly, motherly woman waved at her in the manner of those who are intimates and she responded in kind. This woman, Miss Verity explained, was the wife of a puddler who worked in her father's mills. Here was democracy.

Mr. Brown urges that the commercial organization of any community should be known as the chamber of commerce. The chief reason is that chamber of commerce is the title used in most countries of the world.

A chamber of commerce is a project organization. Its purpose is to accomplish definite ends that are to the benefit of the community. As soon as it is formed it should begin work on some of these projects.

Possibly, for instance, the need is more schoolhouses. A committee on schoolhouses is appointed. Have it report back to the chamber. Check up its recommendations. If it is right get the approval of the board of directors. Put the chamber back of the project to get the schoolhouses. It is a project. It is definite and worth-while work to do. Fight it to success. When it is finished change the committee.

Mr. Brown points out that the problems of the nation are but an enlarged projection of the problems of the community—production, labor, transportation, morale. The prosperity of the community, like that of the nation, depends on production. If the chamber of commerce, by taking thought, can cause more wealth to be produced, it will bring that much more money into the community. Every idle farm in every community might be made to produce $2,000 for that community and there are usually hundreds of idle farms. Almost anywhere it is a good venture to appoint a committee to find out why farms are idle and devise ways to make them productive.

Obstacles to Production

EVERY community has its peculiar obstacles to production. In Adrian, Michigan, for instance, one was the absence of an opportunity for farmers to market their produce. Adrian organized a community market and sold the stock among its citizens at $10 a share. All produce brought to town was bought at the market price. Trucks were provided to hurry it to the Detroit and Toledo markets. The community market showed a profit the first year. Every farmer is now assured of a market for his products. Production is, of course, increasing. More wealth is coming to Adrian.

Washington, Pennsylvania, is one of a number of towns that have established community houses especially for the use of farm people. Here that trying situation which the farmer's wife always has faced when she came to town with her children to do her buying, has been eliminated. She drives her car to the community house where there is a place specially provided for parking it. There is a room in which to check her things. There is a nursery in charge of a competent matron where the children may safely be left and where they can have a good time. The mother is free to do her buying and to have the packages delivered at the check room. Coming to town has become a gala day. The result is that she will drive to Washington to do her shopping though it is ten miles farther from her home than some other town. Other communities are seeing the wisdom of Washington.

A decade and a half ago the chief scramble of chambers of commerce was to get new industries. Industrial funds were raised, bonuses were offered, credits were established for those who would build factories. It has been shown, however, that it was the schemer, the speculator, the experimenter, who was most liable to take advantage of these inducements. The new industries often failed and discredited the community. The idea was wrong. The creation of conditions that will make the industries of a community grow and prosper is the best sort of campaign for new industries.

Then there is that long series of community problems that might be styled civic. Probably the most basic of these is the necessity for city planning. Somebody ought to take thought of the future of every town. George Washington and a French engineer, named L'Enfant, did this in the case of the nation's capital. The result was that the ground plan of Washington has become a model. Nobody planned in the case of New York and the result is that it is laid out in a way that is just the reverse of what it should be. The great arteries of traffic in New York are, of course, the long way of the island. The streets running north and south are, however, but seven to the mile. The cross town travel is light but in that direction there are twenty streets to the mile. If the plan had been turned around and the metropolis had been given its twenty streets to the mile running north and south the benefits to the present and future would have been beyond computation.

The housing difficulties during and after the war gave ample opportunity for experiments by municipalities. Bridgeport, Connecticut, appointed a housing committee which advised the formation of the Bridgeport Housing Company with a capital stock of $1,000,000 to be sold in the community; the building of workingmen's apartments, of two-flat houses in different parts of the city, of villas, of detached homes in various sections. Subscribers to stock were to be allowed an interest of six per cent on their investments but there were to be no other profits. The houses were rented or sold to workingmen. Nobody lost any money in it. The housing situation was relieved. Many ideal homes were created.

Alliance, Ohio, built and sold 467 homes under a similar plan. Norwich, Connecticut, built fifty homes for workingmen; Huntington, Indiana, put up a hundred; Albany, New York, built as many as both. Madison, Wisconsin; Williamsport, Pennsylvania; Sterling, Illinois; Connersville, Indiana, and many other communities have followed suit. The plan works.

Growing Skilled and Industrious Citizens

By UTHAI VINCENT WILCOX

It's a tiny boat and it may have been whittled out like the first top of Governor Ferris's, but valuable lessons have been learned.

FORMER Governor Woodbridge N. Ferris, of Michigan, told some of his friends that when he was about eight years old he asked his father for some toys.

One time he said, "I want a top."

Father said, "Make it! Mother will give you a spool and here is my pocket knife. Go ahead."

"I whittled for a few minutes and found the cutting difficult, so I attempted to give the knife back."

Father said, "Where is the top?"

"I don't want a top now," I answered.

He replied, "You do want a top; make it or I shall be obliged to punish you!"

The former governor said that he was so well acquainted with his father that he made the top.

When he returned the knife his father stopped his work, carefully examined the top saying it was "Fine!" and tried it out by spinning it.

When some of the men who were listening were about ready to say that such a program was pretty severe, the governor concluded:

"My father built better than he knew. He put lime in my spine by insisting that I make my own carts, wagons, sleds, kites, boats and windmills, and that I finish every task I voluntarily began."

He knew, for by continuous effort he reached the governor's chair. He has served as professor in colleges, superintendent of schools, and founded an educational institute of his own.

A number of fathers were discussing neighborhood conditions in their town. They decided that the best all-around, good-natured, happy lad was Sammy Jones. Everyone liked him, and the other boys all tried more or less to imitate him. Yet Sammy's folks were not rich; in fact, they were almost poor, as compared with Willie Smith and "Tubby" Trott. It was also agreed that Willie and "Tubby" were the apostles of discontent.

One man expressed the sentiments of the whole neighborhood when he said:

"A boy I like is Sammy Jones. He never cries, nor loudly moans: 'Oh, mother, give me this and that—some roller skates, a baseball bat—just like the ones their fathers got for Willie Smith and "Tubby" Trott.'

"Young Sammy takes a piece of string, six empty spools, a busted spring, a board, three sticks, one wire nail, a hoop from off a broken pail, and mixes 'em with brains and zeal—first thing you know, a pushmobile!"

Smith was the most successful lawyer in the town. His whole family had money to spend—for the fun of spending it. Willie was one who always had everything that he wanted. He had a pony, an air rifle, ball-bearing skates, a twelve-dollar racket, a bicycle, and was considering buying a motorcycle.

But strange to say, Willie was never happy—not really happy. He was fretful and peevish. He was always wanting something else—perhaps more track for his electric railway, enough to run all the way around the house and cars big enough to ride in.

"The Trotts are splendid people," commented one of the men, "honest and prosperous, with a big enough income from the grocery store to keep them well if not to give them all the luxuries. Yet 'Tubby' will never be happy, so he says, unless he can have all of the things that Willie Smith has."

He wants a bugle, "like Willie got last Christmas," so he can be bugler of his scout company like Elmer Nixton. The fact that Willie can't ride his pony well enough to enjoy himself, or shoot his rifle well enough to hit anything that he aims at, or skate fast enough to beat the girls on the street, or play tennis well enough to have anyone want to play with him, and would be committing suicide if he rode the contemplated motorcycle, makes no difference to "Tubby."

"But there's Sammy!" interrupted one, "How does he get the things he has plus his happy face and good-natured disposition?"

The men all agreed that Sammy's family was the poorest of the three. Yet he was not the poorest boy in town by a long shot. Very early in life, Sammy learned to do things for himself. He had learned to work. By a wise system of instruction he found that it was fun to work because the results were real pleasure.

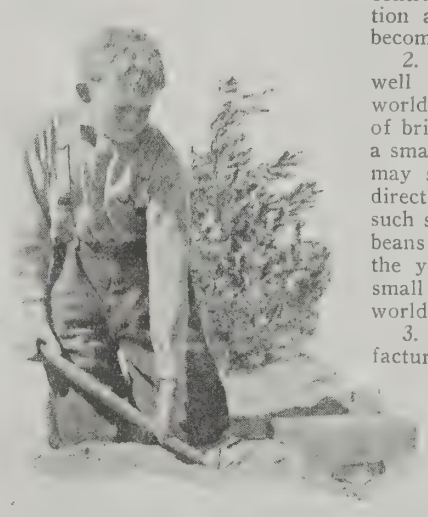
It developed in that discussion that Sammy's father was perfectly willing to spend some money on his boy but in a different way than the others. While they wanted Willie and Henry to *have,* he wanted Sammy to *be.*

That is the whole difference in growing skillful, industrious citizens and loafers, whether rich or poor. Some modern fathers have forgotten the fine art of demanding that their boys help themselves. The toy shop, through thoughtless parents, has dissipated the energies of many children and placed a premium on helplessness.

Work and training with the hand, whether it is called play in kindergarten or industrial training in some schools, will help greatly to foster the healthy American idea that labor and the ability to make and do things are some of the highest ideals of true citizenship.

Is it overstating things to say that all the good people who accomplish things, who achieve, build and construct, whether physically or mentally, are engaged in some kind of industrial effort? It is only vagabonds and tramps, criminals and the overrich that endeavor to get along without doing daily something that is honorable and worth while.

It is this industrial training in early life that means so much in after years. And that is true whether the boy is to be a college professor such as Governor Ferris, or an inventor such as Thomas Edison. To learn to become master of every worthy boyish practice means that he will gain slowly through his own efforts a rational control over both his mind and his body, becoming a splendid example of self-reliance and success.



And the reward not only comes later in life; it makes for joy and happiness every day as truly as it did for Sammy Jones and Governor Ferris.

And because the thing is important and means so much not only to the boy and his parents, but to the whole community, affecting as it does the question of capital and labor, employment and unemployment, it is imperative that the boy be provided with constructive work-play activities.

Even when he is small, encourage him in his desire to build playhouses, mud-dams, "thing-a-bobs," and "do-dads." It is as natural for him to want to do this as it is for a healthy, normal man to desire wholesome occupation. It means not only letting him do things his own way, but at times assisting him in doing it that way. Of course, his movements may be crude, but his instinctive purposes are right and sound and are to be directed rather than suppressed.

But such an attitude must go beyond mere encouragement. It must plan for activities that emphasize training the hands, the eyes, the muscles and the mind. It is increasingly evident that industrial training as a part of education are keys to the doors of community contentment.

Give an ordinary man an ax, a saw, a plane, or a pitchfork and ask him to use it. A moment's effort on his part will reveal his early practice—or the lack of it—in the use of that particular tool. No amount of later training in the use of that implement will possibly bring about the skill that could readily have been acquired in early boyhood.

This lad has constructed a home-made trap and is trying it out. The making of traps, as the making of "thing-a-bobs," takes skill. These are but first lessons—milestones toward a fuller appreciation of working conditions.

The distinctive training of boyhood should be the performance of a large variety of manual activities, thus paving the way for future skill and dexterity.

Home industrial encouragement and training are not enough. It must be fostered, particularly during vacation time, but every father and mother should use their influence in their community looking toward greater industrial training in their schools.

The new and *thoroughly modern* school of today offers a most wholesome alternation of book work and hand work in its daily program. The average school is still far behind the industrial (reform) schools of most states. Here the ideal has been approached in a most practical way.

In such institutions we find that every facility is offered for indulging daily the fundamental juvenile instinct for play, study, manual labor, recreation and sociability. And so, in spite of the fact that the inmates are brought in as little miscreants and are usually lacking in parental sympathy, they often make a surprisingly good showing after finishing their course of training and discipline.

The signs of the times indicate that the industrial type of school will ultimately encompass the entire country. Upon the culmination of that happy event there will be no broken, backsliding vacation periods in the common school curriculum, while every boy and girl will aid in making his career one steady and unbroken ascent toward full maturity.

A seven-year-old boy who lived in a town of 8,000 inhabitants was familiar enough with the following mechanical practices to the extent that his school work was rendered easier, brain and hand being better balanced:

Driving cows	Turning on the trapeze
Riding a horse	Flying a kite
Training a dog	Sawing boards
Feeding the chickens	Driving nails
Riding on a tractor	Carrying kindling
Fishing in the brook	Sweeping the floor
Rowing a boat	Paring potatoes
Going swimming	Making a whirligig
Hoeing in the garden	Making toy boats
Raking and mowing the lawn	Shooting with bow and arrow

Now, of course, it may be impossible for every parent to make all these experiences available for his boy. He should, however, bring his son those that have to do with the training of the eye, of the ear, or the nicety of touch—that takes skill; these are ideals toward which the parent must work for the sake of the higher industrial efficiency and a firmer grasp upon the big problems destined to confront the boy during his coming manhood. Such training will be highly cultural in the truest sense.

Gary, Indiana, is one of the few cities that are providing all-the-year training for children. There the book work and the industrial training are carefully alternated and correlated with proper attention given to play and recreation.

But until more of the educational forces of the country appreciate the real need of training both mind and hand it will be absolutely necessary for the father and the mother to have some definite course of industrial instruction mapped out to supplement the intensive book work of the average public school. In the planning of additional help there are three cardinal principles that should be borne in mind:

1. Above everything else let the boy learn to regard work and industry as being fundamental to the wealth and progress of society. When the boy has decided to contribute something of his own perspiration and service, then the principle has become active.

2. In furnishing the first lessons it is well to start him, if possible, in the world's oldest productive industry, that of bringing something out of the soil. If a small garden plot is unavailable then he may still learn that all foodstuffs come directly or indirectly from the ground by such simple experiments as growing some beans and peas in a box. As this is done, the young mind will be interested to a small extent in a great thread of the world's complex industrial life.

3. Next, let the boy learn to manufacture things for himself. The field, the forest, the mine, the power plant and the factory are the great centers. Some of these factors may be hooked up with the junior's effort by a visit or some work in them at proper times.

A hammer, a saw, a pound of nails, and a pile of kindling boards may be readily secured, and the boy will gladly become an amateur carpenter with a small amount of home encouragement. Or, provide a pair of small tongs, a heavy hammer, a toy anvil, or iron bench vice, and you have a young blacksmith.

Now, for example, obtain a few two-foot lengths of quarter-inch iron rods and show him how to bend them into connected links, thus making a chain for his swing.

What boy is there but that enjoys to the utmost the construction of a small sailboat, the making of a roller slide, a "trip on the trolley," making the old barn into a show house for a circus, or the sailing of kites. It is just these things, persisted in, plus intelligent encouragement and instruction that will go further toward solving the "boy problem" and by the same token the labor problem (because it will make work and industry

a joy) than scores of sermons, books and tons of printed propaganda.

The government through its department of education recently investigated the labor of children. Among other conclusions drawn from its report, there is the unescapable one that for many children manual labor offers the only method of awakening the mind to that place where the boy and girl will learn even from books.

It was proved that children who were counted dull by their teachers and rated below normal in intelligence, showed average and even excellent ability when industrial work was given. This means that there was a part of the mind waiting the stimulus of hand and muscle training. It might never have responded to complex book instruction.

"No. 1. An Italian boy, 14 years old, left school from the third grade, a helper in print work. Teacher's estimate—dull, below average in scholarship, incapable of high skill. Employer's estimate—bright, capable of high skill; highest position attainable, foreman at $25 to $35 per week.

"No. 2. An American boy, left grade five at 12 years old; is puller-off in glass factory. Teacher's estimate—dull, below average in scholarship and deportment; incapable of acquiring high skill. Employer's estimate—bright, capable of acquiring high skill; good character, 'elegant boy.' Initial wage, $4.60; present wage, $7. Highest position will probably be glass blower in six years at $75 a week.

"No. 3. A Welsh girl at 15 years old, leaving grade seven, works in a squib factory. Teacher's estimate—dull, below the average in scholarship. Employer's estimate—bright, a good, capable, reliable girl; may become skillful squib maker, earning from $15 to $25 a week."

If such reports suggest anything, they say that these three children were only half educated in the public school. Permitted to continue under such a system and without outside industrial encouragement from their parents they would have grown up to be subnormal men and women. One shudders to think of the thousands of boys and girls who have thus been started out in life seriously handicapped with a book education unbalanced with industrial training.

There are two types of boys who especially need the co-operation of their parents while they are attending school. First, there are the boys who are naturally "bookish" and who are easily inclined toward a life of aloofness from manual work. This may point toward the kind of vocation that they will enter later on, but such a boy will fill the intellectual office best only after having come into first-hand acquaintance with the meaning of manual industry. Such a boy should by all means be held to his assignments in manual training with proper allowances for the peculiarities in his temperament.

The other type of boy is the converse of the first. He shows a desire to do nothing but manual work and to slight his books. He will do anything to keep from studying or from going to school, unless the school is equipped with a manual training department. For such a boy, the opposite of treatment should be used by the wise father and mother. Allow for and overlook some remissness in the pursuit of book lessons, but do not excuse him from preparing them.

In many towns and cities the earnest parent will find reliable assistance in the matter of obtaining disciplinary work for the boy by consulting the secretary of the Y. M. C. A. Many of these institutions have juvenile departments and even free employment bureaus.

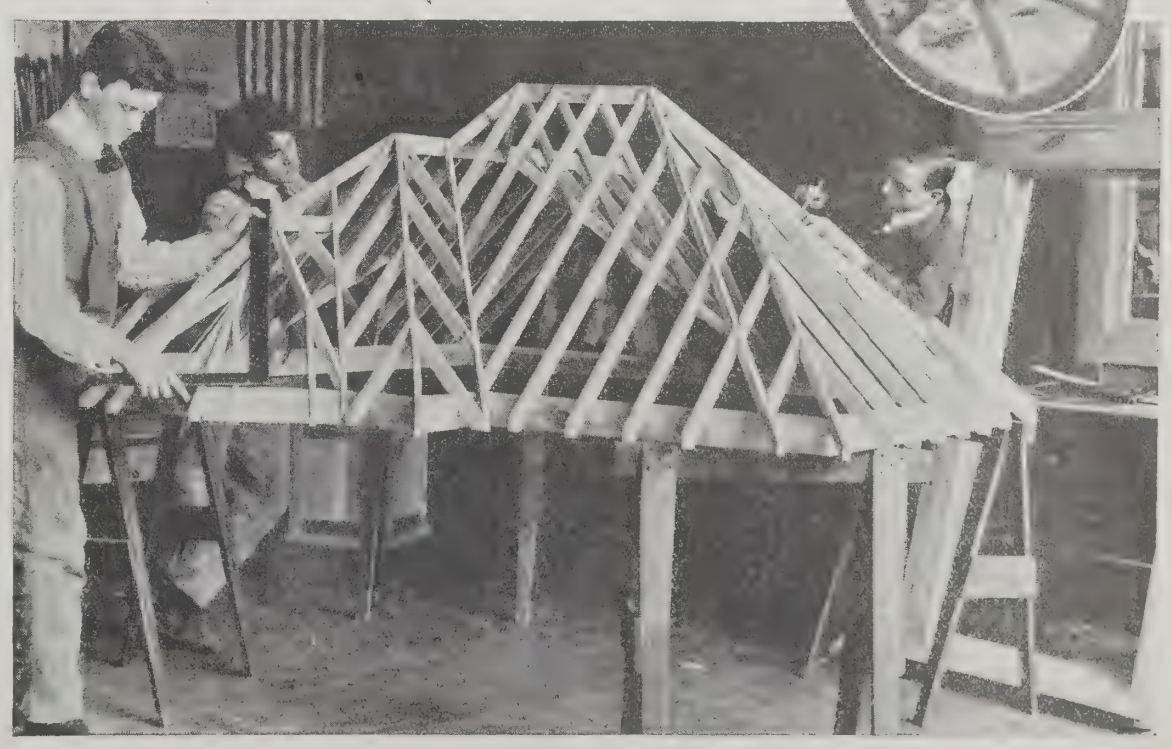
Some of the large cities have instituted vocation bureaus with a full set of advisers for the youth. The most notable instance of the establishment of this service is that of Boston where Frank Parsons first laid definite plans. It is reported that this bureau is now placing about 15,000 annually.

Grand Rapids, Michigan, has worked out a most excellent plan for correlating the school work and the shop work of the city. In a score of municipalities throughout the country this problem of industrial adviser is being more seriously considered. There is reason to hope that a definite and general plan for such service to the young will be perfected within the next ten years.

The recent census report shows that more than a third of the country's population and nearly seventy per cent of the urban dwellers (37,771,114 persons) live in cities of 25,000 inhabitants or more. Thirty-six per cent of the total population was grouped by the census bureau in the 287 communities of this class.

This means that the children of more than a third of the parents are growing up as best they can under congested conditions. Consider their homes: Narrow quarters—Too much furniture—Polished floors—Ash barrel back yards—Clothes line porches—Prohibitions against building and instructive desires of children for action—Afraid will fall when going up and down stairs—Hours of day spent in perambulators or high chairs—High shoes at age of one year and ever after—Polished soles under shoes—Tight clothing—Too warm clothing—Overheated and dry air—Not allowed early mingle to with neighbors' chlidren—Race, religious and political differences—Frequent moving to new environments—No chance for boys to develop leadership—Playthings small and artificial—No sand play—No digging in earth—No climbing—No throwing—Early school—Long hours—Poor light—Nervous environment—Additional nervous burdens of cultural subjects—No housekeeping for girls (cooking and housekeeping ready made)—Father never home—No hobbies, gardening or carpentry when he is home; boy would love to do things his father does—No week-end excursions into woods—No chance to learn how to work with the hands and train flabby muscles—No industrial training! Is it any wonder that the cities produce boy criminals and abnormal and subnormal men who are an easy prey to clever "red" agitators?

With a wise industrial program at home and at school there will be more inventors, fewer labor difficulties, contented workers and industrious and thrifty citizens. They will have the heart to conceive, the understanding to direct, and the hand to educate.



Above—The kindergarten can be the first step in the training of chubby fingers and uncertain eyes. The weaving of baskets is real fun for the normal boys and girls. Why is it, in after years, that some are so anxious to divorce mental and physical labor?

Oval—The first attempts in making a kite, as in making other things, may be crude, but perseverance is one of the lessons in industrial training. There is always the glory of achievement that beckons—even in kite making.

Center—The oldest industrial occupation in the world is agriculture. If possible it should be among the very first lessons learned. Most normal lads find a real thrill in producing things.

Below—This is practical carpentry. These lads are learning in school how to construct the roof of a house. It takes as much ability to learn this properly as it does the first fourteen lessons in geometry. And most boys like it, too!

URBANA ILL. LIBRARY

Briefly Told

Secretary of the Navy Denby is planning to change the Niagara, Admiral Perry's flagship, into a museum. It is now docked at Erie, Pennsylvania.

The Rockefeller Foundation has presented a tract of country comprising thirty-five thousand acres to the state of Louisiana. This tract is known as the Grand Chenier Wild Life Refuge and was purchased in order to preserve the wild life of the country. A condition of the gift requires that the tract shall remain as a perpetual wild-life preserve.

Limited mail service from the United States to Russia has been resumed after a lapse of four years.

The Mongolian camels are particularly vicious and powerful. Their bite generally induces blood poisoning and their breath is so poisonous that it is said no camel driver lives long. Particularly vicious males are marked with a piece of red cloth to warn strangers.

Eighteen gigantic fossilized turtles of an unknown species have been unearthed near Valencia, Spain.

Reports show that of the French military class of 1921 more than seventy-five per cent consists of youths twenty years of age who are fit for military service. This is a high percentage of effectives and the increase is attributed to a decrease in the use of alcohol, the improved living conditions on farms and the spread of sports in France.

The raising of mushrooms in beer vats is becoming such an important industry that growers are calling for tariff protection.

The stained glass in England's beautiful cathedrals is being attacked by some mysterious disease which takes the form of minute holes which in time deepen, causing the glass to flake. So far no remedy has been found.

Carrier pigeons are being used by drug smugglers to transport narcotics. This was discovered when recent storms forced to earth at Fargo, North Dakota, a bird upon whose legs were strapped two aluminum capsules containing cocaine. Other pigeons, similarly "loaded," have been found in Illinois and Minnesota.

Yale juniors propose to perpetuate the life and times of undergraduates of Yale by means of motion picture films.

Many New York families are planning to eliminate rent bills during the summer by erecting tents in state and municipal parks which are thrown open to campers. For $2 a week one is permitted to erect and live in a tent not larger than 10 by 12 feet and containing not more than four persons.

The Post Office Department is supplying its employes with sawed-off shotguns similar to those used by American troops in beating back German trench raiders in France and which brought a protest from Berlin. The War Department has shipped these guns as well as 45 caliber revolvers to all post offices handling valuable mail.

Prominent Japanese women have decided to organize a woman's peace association to promote world peace. It is the intent of the organization to co-operate with similar associations in other countries.

A California bank has installed a device which it is believed will protect its vault from the most skilled of safe crackers. Huge bottles of mustard gas have been placed inside the heavy steel door and so arranged that the slightest jar will break them, allowing the deadly contents to escape.

A new city, which as yet has no name, is being formed in the Province of Saskatchewan on Lake Maskakee. Several factories are extracting chemicals from waters of the lake and exploiting the rich stratified deposits in the lake bed.

The first full-blooded Indian ever admitted to citizenship in the United States is Thomas Blackbird, 23 years of age, of the Sioux tribe and a veteran of the World War. He was admitted to citizenship under an act of Congress by the provisions of which any Indian of legal age who served in the war may, upon application, be admitted to the rights of citizenship.

"Carrying coals to Newcastle" has actually been accomplished by a firm of French exporters, who sent a direct shipment not only to Newcastle, but also to Cardiff, the center of the South Wales coal fields. The coal was sent in response to a demand by English industries suffering on account of the coal strike.

A concert sung by members of the Chicago Grand Opera Company into a wireless telephone at San Francisco was heard as far east as Salt Lake, as far north as Southern Alaska, as far west of Honolulu and as far south as Point Loma, close to the Mexican border. Ships on the Pacific within a radius of fifteen hundred miles also heard the concert.

A bill imposing a fine on landlords who refuse to admit tenants with children has passed the New York Assembly.

The number of students attending the University of Wisconsin has increased to an extent that makes it necessary to establish traffic rules in the corridors and on some of the stairways of the buildings containing lecture rooms.

Contrary to popular belief, the Polynesian people as a race are not dwindling, but are being reinvigorated by the infusion of alien blood. The offspring of the mixed marriages are taking wives from among the full-blooded Hawaiian strain, thus preventing the Hawaiian blood from losing its identity.

A daily newspaper is to be printed on the airplanes traveling between Paris and London. They will be distributed by means of parachutes.

COURAGE THAT DOES NOT FALTER!

And a Magazine Devoted to YOUR Interests!

The American people are paying tribute to the one magazine in this country which has courage to print the truth—which does not fear the powerful interests that exercise such a tremendous influence on the newspapers and periodicals of the United States. Not only are we continuing the discussion which has aroused the entire country to the conditions which have been created by a highly-organized minority, but our plans call for the publication of further truth-telling, informative articles on subjects which for the most part heretofore have been denied the public.

A Menagerie Without Cages

By C. COURTENAY SAVAGE

PERHAPS the most fascinating part of a vacation spent camping in the wilderness is the chance that the wild folk of the neighborhood will pay your camp a visit. A meeting with the birds and beasts is always possible if you get far enough away from the beaten paths of the tourists. But, as a rule, even after the camp has been pitched one has to wait for days before the wild folk become well enough acquainted to consider the strange visitors worthy and safe for an investigation. It may be, of course, that chance and the direction of the wind will allow you to come close to one of the wood folk as you follow a trail, but even then there is seldom time for more than a glance before the timid animal is off down a hidden path where the eye cannot follow.

The reason for this, of course, is the natural instinct for protection, plus the fact that when animals are hunted, they grow wise—and wary.

The ideal way to observe wild animal life is to vacation in one of the great national parks, where the animals are well protected, and therefore tame: those parks which are in reality menageries without cages. There you will find the wild folk in abundance, and a hiking trip through one of the nation's playgrounds will allow the opportunity for hours of animal study.

One does not have to be a professional naturalist to look along the rocky slopes and find the mountain sheep clinging to perilous trails. In the spring and early summer, when they are apt to be down from the heights, you can see the sheep in abundance. In midsummer they go to the more inaccessible places of the mountain ranges, but frequently come down to the lower feeding grounds. They would probably be more closely seen by the tourist if it were not that they have to stay aloft to escape their enemy, the coyote—those swift destroyers who prowl about the lower slopes, and wait to prey on the sheep as they descend from the rocky trails where the coyote cannot follow.

The coyote is also the great enemy of the white Rocky Mountain goat. These goats also follow the ledge-like trails near the summits, but like the sheep they come down to graze. As a rule they make a daily journey to the hilltops, starting early in the morning, remaining on the hilltops to sleep until just before sundown, when they come slowly down. The goats generally spend their winters on the high places, for the sweeping winds clear the little mountain plants of snow, and provide the goats with food. Heavy coats give them plenty of warmth, and not until spring, when the green buds and shoots appear, do they travel toward the valleys.

The bears, of course, are the greatest attraction in the parks. They are to be found along the most popular roadways, and they have become very tame. Almost every visitor to one of the national parks has a story of having seen a bear in the vicinity of the camp, for these fellows are not at all above helping themselves to any food that may suit their fancy.

A naturalist visiting Glacier National Park tells of having seen a mother with two cubs feeding at the hotel, and of the efforts of another bear to get some of the waste food. Each time the strange bear would appear in the clearing the mother would charge, and chase him away, while the two cubs went scrambling up a tree at the first sound of warning from their mother—to remain aloft until she scratched at the foot of the tree as a signal to descend. Such is not unusual. It is roughly estimated that there are more than a hundred black bears in the Yellowstone, and probably half that number of grizzlies.

One of the most interesting animals ranging the Yellowstone is the buffalo, which is slowly increasing under Federal protection. There is a herd of wild buffaloes in Pelican Valley, numbering over one hundred head, and also the so-called "tame" herd in the Lamar River Valley, which, according to the latest census, numbers 442 animals. This herd is popular with tourists, for it can be easily seen and studied. These animals are called "tame" because they are fed hay through the winter season by the government rangers.

There is also a herd of antelopes at Yellowstone, numbering about three hundred animals, jealously cared for, for, as the buffalo, the antelope is growing scarce in the United States. The same park has nearly a thousand moose, and probably as many as 23,000 elks. Less than ten years ago there were twice this many elks, but the very severe winter of 1918, when there was no provision for hay to feed these animals, caused many hundreds to die of starvation, while hundreds of others wandered from the park in search of food—and thus depleted the herd.

Deer are numerous, and may be seen frequently along the most traveled trails, coming out of the woods, and watching the travelers with curiosity. It would be impossible to count the beavers, woodchucks, rabbits of every species, including the interesting snow-shoe rabbit, lynxes, bobcats, minks, otters, and other small animals, not forgetting the coyotes, and wolves.

The porcupine is frequently met as he slowly ambles along a trail. It is almost always a surprise to visitors who have had little opportunity to observe animal life at close range, to learn that the porcupines cannot throw their quills. The porcupine has a very muscular tail, with quills above and at both sides, set at all angles, and a blow from this tail will drive the quills deep into the flesh, even penetrating shoe leather. The porcupine is a close second to the bear in camp scavenging, for he will steal salt pork, ham, or anything else that is salty or greasy. If an old wooden box, or a table, which has been allowed to become greasy, is left in an abandoned camp, the porcupine is almost sure to gnaw at it.

The birds, of course, are always of interest, and are seen in all parts of the wilderness. The authorities at Yellowstone report having noted approximately two hundred varieties of birds, but less than half this number are common. Hawks, owls, ducks, geese and so on, are frequently seen, as are the pelicans, which seldom fail to interest visitors, and, because of their protection, are comparatively tame.

The ptarmigan, a rather large bird, and notable for its remarkable coloration which makes it practically invisible, is on the lower slopes during the breeding season, but spends most of its time on the heights. In winter the ptarmigan is white, and cannot be distinguished from the snow banks, while in summer it is ground colored, with touches of gray, so that it blends into the underbrush, so finding safety from its natural enemies.

There are, of course, the usual song birds—the robins, the warblers, the mountain bluebirds, the wrens, and so on; as well as the wonderful water birds—the loons, gulls, grebes, herons, and so on.

For those who can find keen pleasure in wandering in the wilderness and observing the animals in their natural existence, it is impossible to over-estimate the enjoyment to be found in these menageries without cages. Each mile holds its glimpse of feathered and furred folk, each new animal seen lends additional interest, as, almost unconscious of the human visitor, the dwellers of the forests go about their daily lives.

The Public Defender—A New Bulwark

By JOHN B. WALLACE

IT IS difficult for the human race to devise a system whereby equal justice can be meted to all. Our judicial system is far from perfect but it is the fruit of centuries of experiment. It is an approximation of the ideal that we wish to attain.

Consequently every new idea that will tend to equalize the application of the law should be hailed with rejoicing by both the bar and the public. Yet this is far from being the case. There is no more conservative body of men than the average run of lawyers unless it is the country and small-town bankers. The slightest change or innovation in our system of administering justice is viewed with pessimistic alarm especially among the older members of the bar. Like the law itself, which, founded, as so much of it is, upon precedent, has tended to become as archaic and musty as the old tomes in which its precedents are bound.

This explains, perhaps, the reason for the delay in the general adoption throughout the country of the system of public defenders such as has been in successful operation for more than seven years in the county of Los Angeles in Southern California.

The idea of a public defender is far from being a new one. It has cropped up intermittently for years. Several eastern cities and two or three in the Middle West have officials styled as such but nowhere has there been a complete system established for the defense of the unfortunate and the confusion of those who prey upon them as exists in Los Angeles.

On every hand we hear voiced fear of Bolshevism and anarchy and the loudest and most persistent of these "Viewing with alarms" come from members of the bench and bar.

Yet, although there exists no more potent instrument for the smothering of the seeds of anarchy than the office of public defender, we find few of these vociferous reformers advocating any such constructive measure. It is not so much to the credit of the bar of Los Angeles County that they founded this much needed adjunct to our judicial system as it is to the discredit to the bar of the country as a whole that the system has not been universally adopted.

Before proceeding to a detailed description of the Los Angeles system, it might be well to point out the more patent defects in the system employed in other communities which the office of public defender is designed to correct.

The law has always recognized the right of a person accused of crime to a fair trial. In this country it has given the defendant the presumption of innocence, putting the burden of proving his guilt upon the state. We have also enunciated that all men are equal under the law. The law is the same for both rich and poor. Theoretically, this is true, but how has it worked out in practice? John Doe is a rich man. He is arrested upon suspicion of having committed a felony. We will assume that it is a bailable offense. As soon as he lands in the police station he telephones to his lawyer and to his friends. Before he may have had even a glimpse of a cell his bond is furnished and he is free until the day of his trial. He may have suffered a temporary inconvenience but that is all. When his trial comes up he is defended by the ablest attorneys that money can hire. Every advantage of law, both technical and social, is taken. The standing of the defendant, as well as the standing of his high-priced attorneys with the court, matters greatly. If the defendant is innocent or is acquitted (and the terms are not synonymous) he goes forth without having spent an hour in durance. If he is convicted he still may retain his freedom by putting up bail pending an appeal.

How is the case with Richard Roe, a poor laborer, equally a citizen of this great country with John Doe and theoretically entitled to equal rights and privileges? He is arrested upon suspicion of having committed the same kind of an offense as John Doe. Waiving the treatment that he will receive from the arresting officers, and, believe one who has had experience as a police reporter, there is a vast difference in the way a man of wealth and standing is handled upon arrest by police officers and a poor laborer without friends or influence; waiving that, however, Richard Roe, being without bail money or property security, is thrust into a cell to await his preliminary examination. If it is a case where the police have not yet obtained sufficient evidence to warrant the court to hold him for trial, he may be kept in jail for several weeks before he is given a preliminary hearing. This is in clear violation of the law but having no lawyer or money to hire one to get out a writ of habeas corpus, Roe has no recourse but to await the convenience of the police.

When he finally appears in court he is asked by the judge if he has an attorney. He replies that he is unable to hire one, whereupon the court appoints a lawyer to defend him. Here is another instance where theory and practice do not jibe.

An attorney, being an officer of the court, is compelled to defend any case to which he may be assigned. In some states he is allowed a nominal fee, in others no compensation whatever. A lawyer who depends upon his fees for his livelihood certainly cannot be censured for not wishing to take cases for nothing. He, therefore, can be depended upon to have some reasonable excuse for not taking the case and the judge being an attorney himself and fully understanding the situation will invariably accept the excuse.

There is, however, always a number of fledgling lawyers, just out of school, upon whose licenses the ink is scarcely dry, who are ready and anxious to obtain such cases for the experience. And it is upon these willing but inexperienced youths that Roe must rely for his chance of liberty. Just as the body of the poor man is used for purposes of experiment by the youthful surgeons, so his freedom is in the hands of tyro attorneys. His lack of money prevents him from liberty of choice and he is compelled to accept what he may receive.

It was to correct this and other injustices that the office of public defender was instituted in Los Angeles County. Prominent jurists of Southern California had long noted these abuses and when in 1912 a new charter for the county was to be voted upon, a number of them got together and formulated a provision creating the office of public defender.

The duties of the public defender as outlined in Section 23 of the charter are:

"Upon request by the defendant or upon order of the court, the public defender shall defend, without expense to them, all persons who are not financially able to employ counsel and who are charged in the superior court, with the commission of any contempt, misdemeanor, felony or other offense. He shall also, upon request, give counsel and advice to such persons, in and about any charge against them upon which he is conducting the defense, and he shall prosecute all appeals to a higher court or courts, of any person who has been convicted upon any such charge, where, in his opinion, such appeal will, or might be reasonably expected to, result in the reversal or modification of the judgment of conviction.

JUDGE
WALTON J. WOOD

WILLIAM T. AGGELER,
Public Defender of Los Angeles County.

"He shall also, upon request, prosecute actions for the collection of wages and of other demands of persons who are not financially able to employ counsel, in cases in which the sum involved does not exceed $100, and in which, in the judgment of the public defender, the claims urged are valid and enforceable in the courts.

"He shall also, upon request, defend such persons in all civil litigation in which, in his judgment, they are being persecuted or unjustly harassed.

"The costs in all actions in which the public defender shall appear under this section, whether for plaintiffs or for defendants, shall be paid out of the county treasury, at the times and in the manner required by law, or by rules of court, and under a system of demand, audit and payment which shall be prescribed by the board of supervisors.

"It shall be the duty of the public defender, in all such litigation, to procure, if possible, in addition to general judgments in favor of the persons whom he shall represent therein, judgments for costs and attorney fees, where permissible, against the opponents of such persons, and pay the same into the county treasury."

The salary of the public defender is fixed at $375 a month during the first year he may hold office and $400 a month thereafter. He is allowed to maintain such a force of deputies and office force as the business transacted by his office may require. At present the public defender of Los Angeles County has a force of five deputies, a clerk and a stenographer.

The positions of public defender and that of his deputies are under civil service rules and are obtained by competitive examination.

The county of Los Angeles was singularly fortunate in obtaining for the first two incumbents of the office of public defender men of marked ability, in the persons of Walton J. Wood and William T. Aggeler. These men, together with a number of other prominent members of the bar in Los Angeles, took the civil service examination for the position when it was first created. Wood stood first and Aggeler second; Wood, therefore, obtaining the office and making Aggeler his chief deputy.

On the strength of his record as public defender, Wood was last autumn elected as a judge of the superior court and Aggeler took his place as public defender.

The incumbent is a native of California and a graduate of the University of Michigan. Although he had a successful private practice, this is his first public office.

His induction into the office of public defender was accompanied by unusual circumstances. His first case was one of the most sensational murder trials known in the history of criminology, a case that embraced every element of romance, mystery and finance and was exploited upon the front pages of all the newspapers in the country.

A handsome matron of unusual intelligence and charm was charged with the murder of a wealthy mining man whose body was found, after a search of several weeks, partially buried in the cellar of his mansion in Los Angeles. The woman, whose husband was a man of excellent character but in poor health and straightened financial circumstances, tried to employ counsel but was unable to pay the fees asked. These fees varied from $15,000 to $25,000. In despair she turned to the public defender. The evidence against her, while purely circumstantial, was overwhelming and she was convicted.

Although the public defender had made a fight which won the commendation of the trial judge who, denying a motion for a new trial, stated that everything possible had been done for her defense. The cost to the county was only $130. Contrast this with the $25,000 fee for attorneys alone that private counsel would have cost the defendant. In this case, which occupied 14 days in its trial, we had the unique spectacle of the state prosecuting and the state defending the accused with but one end in view, to obtain justice at the least possible cost to the citizens of the community.

Although the public defender's office lost this, the most spectacular case since its establishment, it has made a most unusual record in obtaining acquittals.

It is estimated that ninety per cent of the cases tried by the state result in convictions. This is because of the fact that the district attorneys can pick their cases and most of them refuse to put the state to the expense of a trial unless they are practically certain of obtaining a conviction. It does not enhance the reputation of a district attorney, either, to fall down on very many of his cases and consequently he goes into court with a case half won before it is tried. On the other hand the public defender has no choice. He is compelled to take the cases as they come to him when the accused maintains his innocence. Notwithstanding this handicap the public defender's office has never fallen below 25 per cent in acquittals and disagreements, and one year it reached as high as 44 per cent. This speaks volumes for the ability and diligence of the men occupying that office and proves that the defense of the poor is in as good hands as if they were able to employ the highest priced lawyers.

The report for the last court year, 1919-1920, shows that the public defender's office handled 469 criminal cases. This was in addition to 89 consultations with prisoners in jail, where advice was given but the cases turned over to other lawyers.

Of the felony cases tried during the year twelve were found guilty, two were convicted of lesser offenses than that charged in the information; seven were acquitted, and five were discharged because the jury could not agree. Five insanity trials were handled in which two were proved to be sane and the other three committed to an institution.

In preliminary examinations in the superior court 31 defendants were held to answer, six were discharged and the cases dismissed and 34 were stricken from the calendar and the defendants released.

Thirteen defendants in criminal cases were found to be insane and committed to institutions.

The public defender's office made 243 pleas of guilty in behalf of its clients and 12 pleas of guilty upon lesser offenses than charged in the information.

One hundred and thirteen defendants were granted probation, 49 had their cases dismissed without coming to trial and 122 cases were stricken from the calendar.

Not only does the public defender's office accomplish a great work in obtaining justice for unfortunates but there is no doubt but that it is of sound economic benefit to the state. Many times the public defender is able to obtain the confidence of a prisoner and obtain facts which, presented to the district attorney, result in his dismissing the case without trial, thus saving the state expense as well as releasing the defendant from prison where he is boarding at the expense of the taxpayers.

Although the public defender's office is an entirely separate institution from that of the district attorney they are both servants of the public and are supposed to work in harmony in the interest of justice and economy. The public defender, while fully protecting the interests of his client, has not the same incentive to delay and procrastinate as has a private attorney who hopes thus to justify his fee. Therefore, the slow wheels of justice are often speeded up through the

An Hawaiian Situation

THE House Immigration Bill enacted by the last Congress and which failed to become a law through President Wilson's pocket veto, was a thoroughly good bill. It was passed after full and exhaustive hearings in which were such opposed interests as the steamship companies which find this immigration so profitable, the mining corporations eager to exploit cheap labor, and the Jewish Committee which is so strenuously exerting itself in the interest of the immigrants from Eastern Europe.

The bill is again under discussion in Congress and day by day it has been mutilated, so that in its present state it bears little resemblance to the original Johnson measure that fairly met the imperative need of proper restrictions. First, all immigrants having relatives in this country were exempted; then all "refugees from racial, religious or political persecution." At last advices, a joker seems to have been slipped into the measure under which many thousands of French, Swiss, Dutch, Italian, Spanish, Austrian, Hungarian and Portuguese immigrants are barred while admitting all the Poles, Rumanians, Galicians and Germans who may apply. The bill, thus scissored and patched, is said to be slated for prompt passage by the Senate. President Harding will undoubtedly feel called upon to veto it, and then we shall have the whole long-drawn-out business all over again. Of course, this is precisely what the "organized racial minority" representatives are after. Despairing of blocking a bill squarely meeting the country's instant need, they are shrewdly maneuvering to prevent restriction until they can get into New York the several hundred thousands of their congeners being herded at Danzig and other European ports.

Perhaps legislators distracted by propaganda bombardment may find a gleam of light in the resolution introduced the other day in the territorial legislature of Hawaii. It requests that Congress permit the importation into Hawaii of 25,000 Chinese laborers, so that they may have an opportunity to work and earn money to send to relatives in the famine-swept districts of the Chinese Republic.

The proposed measure specifically stipulates that Chinese entering Hawaii under such permission shall engage only in agricultural pursuits, that they come under rules and regulations promulgated by Congress and the Department of Labor, and that they remain for a period of not more than five years, then returning to China.

The only difficulty about a solution on similar lines of the problem of Jewish immigration is that the Chinese are able and industrious agricultural workers, while the bulk of the Eastern Jews are not producers. Then Hawaii wants the Chinese; but apparently no country wants the scourings of Eastern European ghettos.

Bolshevism's Oriental Offensive

EVIDENCE accumulates that an important part of the Bolshevist scheme to extend its "Proletarian Dictatorship" over the whole planet is related to a revival of the old Muscovite dream of detaching India from the British Empire. The Russians were at the gates of Herat in 1878. Today, the Red Armies of the Jewish dictators seem not only to have affected the Afghans, but also to be preaching revolutionary unrest throughout India itself. Those responsible for the "Berlin to Bagdad" policy of German Junkerdom have made it plain by their aid and support of the Turkish "Nationalists" under Mustapha Kemal Pasha, as by their success in winning over the Armenians to Bolshevism and their present activities in the Balkans, that the ancient lure of India's wealth is proving a powerful incentive to the devastating march of the arch-looters of the modern world.

That Britain is well aware of these designs, is shown in the communication transmitted by Sir Robert Horne, president of the board of trade, to Leonid Krassin, Soviet commissary in London, simultaneously with the signing of the trade agreement between the British and the Soviet governments. In this letter it is openly charged that the Soviet government's policy in the East and the Near East aims at "the overthrow of British rule in India." Activities on the part of the Bolshevists on the Indian border are characterized as "inconsistent with the stipulations in the trade agreement." Sir Robert also cites the employment by the Bolshevists of "self-convicted traitors" like Natu Rey for the instruction of Indians in revolutionary tactics and the sending of emissaries into India with the avowed purpose of "investigating the possibilities of revolutionary work" in that country.

Notice is served on Lenin and his associates that if they desire the trade agreement to continue in force there must be an immediate cessation of these antagonistic activities. It is probable, under all the circumstances, that Lenin's masters will call off his Eastern offensive. Why should they seek to overthrow British rule in India, when they can use that rule to mask their own very real dominance?

Keeping Up the Old Ruins

THERE is hope for the British Empire! In the midst of miners' strikes and Irish and Indian insurrections, complications with France over German reparations, speculation on the Oxford-Cambridge boat race and anticipations of the football season, to say nothing of the crisis threatening Lloyd George's coalition government, the British Government is considering the restoration of the ancient Abbey of Whitby. Considering its venerable age—it has been standing for more than a thousand years—the ruins of the famous Benedictine monastery are in a fair state of preservation, so far as the chapel is concerned.

Although the groined roof, the magnificent oriel windows and doors and the central doorway with their rich ornamentation have yielded to the tooth of time, the main walls, parts of the choir, the north transept and the nave are so nearly intact that the lines of the original architecture may easily be followed. Founded in the year 657 by Oswy, King of Northumberland, the monastery has a respectable antiquity. Among its monks were Caedmon, the Saxon poet and scholar, who ranks among the fathers of English literature, and whose manuscript books serve to this day as models for printers and typefounders.

The monastery was what is known as a "double" one, and its first abbess was St. Hilda. She was succeeded by King Oswy's daughter, Aelflaed. It was here that the famous council was held in A. D. 664 to determine the controversy between the Irish and the Saxon churches as to the date of Easter. About 200 years later, the invading Danes completely destroyed the monastery and dispersed the community. It was not until after the Norman conquest that it was restored by William de Percy, an ancestor of the Earls of Northumberland.

American tourists are apt to associate Whitby with the oysters for which the place is famous and of late years the town has come to be a popular seaside resort, owing to its situation on the east coast of Yorkshire.

It was only last summer that an appeal to the English-speaking world was made for a restoration fund for Westminster Abbey. The very suggestion that this ancient fane, Britain's Parthenon, was in danger of falling apart, quickly brought in subscriptions totaling more than $500,000. This regard for the architectural heritage of the Anglo-Saxon race, with all its historic and heroic associations, is an expression of a sense of connection and continuance of the centuries, a recognition of the fact that "All of good the past hath had, remains to make our own time glad." It is also a reminder of Edmund Burke's apothegm: "A people who have no regard for their ancestry will not be apt to have much regard for their posterity."

"Gone Mad With Egotism"

IN CONNECTION with the explicit declaration in the House of Commons the other day that the British Government was in possession of unquestionable evidence of a close connection between the Third Internationale at Moscow and the leaders of the revolutionary movement in Ireland, it is interesting to note that Irishmen in this country are waking up to the game being played with Irish hopes and aspirations by the same conscienceless conspirators who are responsible for the Russian chaos. Eamonn Valera, "president of the Irish Republic," is now charged by Bishop Michael J. Gallagher, of Detroit, national president of the Friends of Irish Freedom, with being "a man gone mad with egotism and presumption," and with having "deliberately split the Irish movement in America."

Dealing with Valera's visit to this country, Monsignor Gallagher, in a statement issued in Boston, further charges that the Sinn Fein leader attempted to dictate to the Republican National Convention at Chicago and that, failing to secure control of the Friends of Irish Freedom, he started the new organization known as the A. A. R. I. R. In support of this statement, Bishop Gallagher publishes a letter from Valera to Judge Cohalan of the New York supreme court; Judge Cohalan's reply warned Valera that American public opinion would not tolerate interference in American affairs by any citizen of another country, and a letter from John Devoy, editor of the *Gaelic American*, to a colleague, declared that submission to Valera's "dictation" would utterly discredit the Irish in America and destroy the whole movement.

The bishop's statement sheds needed light on the midnight assassinations and barrack burnings so alien to every tradition of Milesian gallantry and calculated gravely to prejudice the Irish cause. All lovers of Ireland must condemn such Bolshevist tactics in Ireland, no matter how little we may regard them as justifying English "black-and-tan" reprisals. Plainly, such methods savor of Moscow, rather than of Cork or Dublin. Perhaps it would be more exact to say that the Valerian policy of "dictation" and wholesale murder, finds the same source as that of Lenin and Trotsky in the purlieus of the big money-mongers of Frankfort and of London and Wall Street.

There is something un-Russian in the Russian revolution; something wholly un-Irish and un-English in the Irish trouble; something absolutely un-American in certain movements in America. What is it?

The French Income Taxes

THERE seems to be a growing opinion in France that the government, in its anxiety to obtain such increase in the revenue as would really bring about the necessary equilibrium between receipts and expenditures, rushed through the chamber, last summer, measures which are now being repented of at leisure. It is charged that the supertax on gross income especially has proved the sort of "bleeding" which instead of curing is likely to kill the patient.

The complications of the present system come in for special criticism. It contains a long series of surtaxes and exemptions calculated not only to hit the taxpayer according to his total annual income, but also according to his personal status. Bachelorhood is penalized; the head of a family enjoys exemptions more if he has children, less if without children. These are only a few of many variations and exemptions in the tax that make it all the more difficult to collect in a land notorious for tax dodging. It is also charged that this income tax is in the nature of a supertax and amounts to double taxation.

The farmer, the manufacturer, the merchant and the salaried employe are all called on to pay a progressive tax averaging 50 per cent in addition to taxes on profits. The inheritance taxes are said to be likely to degenerate into a confiscation ruinous to the country as to the individuals directly affected.

Although the introduction of an income tax in this country was fiercely opposed for years, we seem to have managed much better this matter of the adjustment of its burden, in so far as concerns the exemption of small incomes and the shifting of the incidence to those enjoying monopolistic privileges. But why should this whole matter of taxation be so complicated and the cause of such general discontent and complaints of favoritism and injustice the world over?

Are we not about ready for the sweet simplicity of the single tax on land values?

Mr. Ford's Page

THE prophets are again at work trying to forecast what the business future will be, and it is not difficult to distinguish between those who are expressing their hopes and those who are expressing their convictions. Everyone, of course, hopes for the best, and there is a feeling that sunny talk will bring sunny days. But the people have lately had an experience with hard facts which will help them to require hard facts in any forecast which prophets may make of the future.

On the whole, the depression of the past few months, which began to lighten late in January and had made considerable amends by the end of April, brought a benefit which is difficult to speak about, because people are so averse to benefits which are received through suffering. People are able to understand how they may be physically better after a sickness than they were before, because they can see how the sickness brought to a halt certain practices which caused it, and rid the body of accumulated poisons. But in economic affairs their vision is not so clear, because it is not easy to relate one's own economic distresses to the general good.

The economic distress was not confined to a class. It was not only felt in the kitchen, it was as keenly felt in the office. No one prospers alone, no one is deprived alone. We are all partakers of the same general condition. If this were better understood, there would be more teamwork in pulling ourselves out of the economic mire.

There have been benefits which cannot be weighed or measured in material things but which yet have a very direct bearing on our material welfare, and if those benefits are only retained and if we continue to appreciate them, the future will be to that extent more promising than it might otherwise be.

Everybody is more sober. Everybody has a stronger sense of individual responsibility. This sense of responsibility may only express itself with relation to one's family or one's job, but that is enough to make it felt throughout the whole economic system. There is more self-government. Men are not toying with reality. They are not taking chances with fate. They are moving along the old, safe, dependable lines of honest work and sober living. This is a great gain over the former haphazard months when men thought the economic world would continue to go steadily on, no matter what they did.

More men are actually at work than before. In times of prosperity fewer men actually work than at any other time. The white collar sometimes imposes a burden on society out of all proportion to the service it renders, and there are now fewer white collars for the adornment of amateur speculators.

Take the large army of real estate speculators, for example. They were legion in times of prosperity. There is, of course, a legitimate business in real estate which is economically healthy and socially serviceable. But that is not the wildcat real estate speculation which was so rife during the hectic period of our so-called prosperity.

In a drunken, speculative period about 10 men must lose money in order that one man may gain. The injury, however, is not only that hard-working people lose their savings to the vendors of alluring real estate stories. That is bad enough; it is a situation which one would prevent at any cost. Savings are too sacred to be juggled with for the benefit of oily-tongued gamblers.

In the larger view, the money is not lost, though it is lost to the person whose it rightfully is. But it is not lost; society still has it. The real injury, however, from such transactions is that non-producers are allowed to live a little longer on society by reason of the money they have received from the men who came by that money in honest ways. The money enables them to impose themselves for a little longer as a burden on society. They are allowed to use up the fruit of the earth, making no other return than their use of gambling wits.

Now, when the shake-down comes, it shakes this large army of parasites out of their places, detaches them from their "good things," and forces them to render actual work in exchange for what society gives them. This is a great relief of the social burden, also it is a measure of safety for those people who invest in dealers' stories instead of in solid values.

It is perfectly legitimate for people to invest their money. Some forms of investments are unavoidably speculative. No one positively knows how even a legitimate article is going to sell until the initial expense of producing and marketing it has been shouldered. But it is obvious that the man who has no capital but the little he has been able to save out of his earnings, should not be compelled to take chances. He should be permitted those channels of investment which carry with them the least chance of loss.

Someone has said that no man can gather much of a surplus on what he earns or what he saves, and that unless he can be connected some way with the profits of larger aggregations of capital, his chances of accumulating a competence are small.

This need is being met by making men partners in the business in which they are employed. It would make for industrial soundness if the principle were rigidly adopted that no man should be a partner in any business who is not employed in it. And the completing principle would be that every man worthy to be employed should be a partner, in the sense as participating in the total earnings of the concern. His wages are his individual earnings, but his labor contributes to the total earnings of the factory or mill, and in these he may share if he is permitted to make investments in the factory or mill. The healthy desire for investment, the economically sound principle of distribution, would thus both be satisfied. And in times of industrial depression, the man would know whether it was business or the boss that caused slackness. Moreover, when depression came the man would not expend his energy in useless condemnation of everything and everybody; he would form part of the group already existing who are trying to find out the cause of the cure of these senseless and stupid kinks in the line.

Many errors were made during the period when men were throwing up their jobs with utmost unconcern because jobs were plentiful. Extra money-prizes were offered to keep the men at their post of duty. Extravagant promises of paternal benefits were made by concerns who had never previously evinced the slightest interest in the welfare of their employes. And when slack times came, all these promises went by the board—except where they were an integral part of the whole working system of the concern.

Paternalism has no place in industry. Welfare work that consists in prying into employes' private concerns, is out of date. Men need counsel and men need help, oftentimes special help; and all this ought to be rendered for decency's sake; but the broad workable plan of investment and participation will do more to solidify industry and strengthen organizations than will anything else.

These are some of the benefits that have accrued from the last depression. Workmen are more sober-minded; managers see some problems more clearly. Our feet are on the ground. We are convinced that this whole period can be weathered through if we substitute co-operation for class condemnation. The right men in the engine-room and the right men in the wheelhouse brings the ship through safely.

TIMES are better, but we are not through the woods yet. Times will be better still if we keep the sober lessons learned in the months of depression. A generation is like a young man, he dissipates until he gets his bumps, but if he learns his lesson it will make a man of him. One hopeful sign: not only have the workers gone back in such large numbers to the job, but men who did not work during the "prosperity" have also gone back to the job. Prosperity always raises a small army of speculators who keep themselves above the necessity of toil by inducing honest working people to invest in things that never produce a return. Society's burden in carrying that crowd has largely been relieved; they are now producing what they use.

Free Films for the Millions

Sympathy for the Seeing Leads One-Time Blind Man, With a Young Woman's Help, to Become Picture Distributor for the World

By AARON HARDY ULM

IF YOU were stricken blind and were forced to live in darkness for years, what type of unfortunates would seem to you to be most needful of help? The blind? That perhaps is the usual reaction. But it wasn't the reaction of a man the writer talked to the other day. For eighteen years that man was blind, but his thought and sympathy turned not so much to those who are sightless as to the millions who can see.

"If my sight is ever restored," he resolved, "I shall devote the remainder of my life to helping people with good eyes to see." For the memories of what he had seen during the days of good sight were his most satisfying resource during his years of blindness. Though he had traveled widely, observed with care and read much—in fact, his blindness was due to excess reading under bad conditions—he often regretted that he had not used his eyes for storing his mind with even more food for reverie when he could no longer see. The run of people, he concluded, were to be pitied for failure or lack of opportunity to use and enjoy the blessings of sight as they might.

Today he directs probably the most extensive motion picture organization in the world. Films sent out by him are viewed by more than 2,000,000 persons every month. One of his exhibiting units is now in the wilds of the Philippines showing western civilization to ex-head hunters. Another is in Sumatra. One is in India. Others are scattered throughout the United States. Films are sent into half the countries of the world almost every day and others are brought from them to this country. One condition attaches to every film handled or displayed: no one must be asked or permitted to pay for seeing it no matter how or where shown. More than thirty governments co-operate officially in the work of the man who was once blind and now wants to teach all the world to see—and is doing it on a scale you would hardly think possible.

(C) Harris & Ewing

DR. FRANCIS HOLLEY

He is Dr. Francis Holley and his establishment is known as the Bureau of Commercial Economics, with headquarters in Washington, D. C. Though it works for and with our government and those of other countries, it is not a public institution. Neither is it commercial, though numerous trade bodies work with it. In the broadest sense it is educational and, in every sense, international. It charges for nothing it does and therefore earns no money. Yet funds for its support are not begged. It is supported, says its literature, by "endowment, annuity and voluntary subscription," but it is an open secret that Dr. Holley himself supplied the funds for founding it and most of the money needed for carrying it on. In addition to giving all of his time to the work, Dr. Holley meets all money deficits resulting therefrom.

Dr. Holley is a civil engineer by profession and has been admitted to the bar. He educated himself, having gone to work as a messenger when 13 years old. He became a builder of railroads, chiefly in Canada and the Far West, being associated for a long time with the Canadian Pacific System. At the time he was stricken blind, by strain caused by excess studying at night, often in tents with only a candle for light, he had accumulated a competency. He lost his sight in the early nineties. He spent the next eighteen years wandering the world in search of a cure, which he finally found, in partial form, in Pittsburgh, where a specialist in electrical treatment restored about one-third of his normal sight.

In 1902, while he was wandering through a cutlery factory in Sheffield, England, his companion in describing the work told him of two boys, one of whom was standing at each end of a work table watching the skilled workmen.

"What are they there for?" Dr. Holley asked the manager.

"They are apprentices and pay the company $125 a year each for the privilege of learning the trade," he replied.

"How do they get the money?"

"They earn it by working out of hours in the early morning and night."

"Why don't you have motion pictures made of the workmen in action and let the boys learn from them?"

"Impossible."

Dr. Holley asked if they would let him have the idea tried out. He went to Paris and persuaded Pathé to let him take an expert movie photographer to the factory in England. There the machine was rigged up over a work table and a series of motion pictures were made. They proved entirely adequate for the apprentices, but ten years passed before the man who had them made saw them displayed. But during those years he became convinced that the motion pictures offered the best means for helping people use and enjoy blessed eyesight. He made plans whereby pictures could be given distribution beyond the range of the commercial movie business and be employed for purposes outside the realm of mere entertainment.

The medium he developed is quite elaborate and far-reaching. He began by bringing the subject to the attention of the American Association of College Presidents. He proposed to do the work if the members of the organization would help with advice and support. They adopted the name by which the establishment is known, a name that doesn't convey an exact or even a fair picture of what is done. He then went before state legislatures and persuaded many to provide funds for extension work with pictures to be carried on by the state universities, or the agricultural and normal schools. It is through those institutions that the bureau mostly functions in this country. It gets the pictures and often supplies the conveyances and apparatus used in taking them about and displaying them. The colleges make up the itineraries, look after the publicity and attend to incidental expenses. The bureau now owns and operates more than thirty automobile trucks specially designed and built for the work. On the top of each big truck there is a screen frame made of metal. Inside the truck there is an electric motor, projection machine and a phonograph with a sound amplifier.

Thus, excepting when weather is bad, buildings are not needed and are rarely used to give exhibitions. A screen can be set up in a jiffy's time in a park or street, in a field or on a vacant lot. The picture is projected from the truck to the screen. For exhibitions given with a program having a specific purpose in view there is advance publicity. It is never difficult, however, to get a crowd. It is better frequently to give shows entirely unannounced. In those cases, the truck is driven around the town where the exhibition is to be given. The man in charge goes to the local telephone exchange and has the manager inform the operators of what is to be done. Early in the evening the screen is set up, the phonograph started and in due time the crowd shows up—a larger crowd as a rule than when advance announcement is made. For the unexpected appearance of the truck and the phonograph music, amplified so that it may be heard for a mile or so, piques curiosity. People call up the telephone exchange to know what it is all about, are told, and then they hasten to the center of town to see for themselves.

"Frequently our equipages are taken for patent medicine or similar outfits, but when the people find that there is no surprise for them at the end of the show their pleasure is all the more and the effect is better," says Dr. Holley.

The bureau was among the first in this country to use a Frenchman's invention that makes daylight pictures possible. It enables them to give displays in work shops during the noon hours.

Phonograph records are made in singing keys so that crowds may join in and sing with them.

What kind of pictures are shown?

Virtually every kind except the sort proclaimed so loudly by the movie theaters of the large towns and cities. There are no "Midnight Meddlings" and "Love and Live" stuff, and in those localities where the trucks navigate most of the time no such pictures are wanted.

The films are informative. They show life in other lands and in different parts of our own country. They show how things are done; how various articles are made, for example. In a booklet issued recently 932 different films are listed, by titles, as available for use in this country alone. The first one on the list is entitled "Out of the Mud," being a good roads picture, prepared very probably by the United States Good Roads Bureau. Other titles taken at random are "Evolution of Writing," "Making Grape Juice," "A Day with a Park Ranger," "Skiing at Chamonix," "Battle of Cambrai," the last one on the list being, "Little Country Theater." The purpose is to teach as well as to inform and entertain. Thus, in addition to general exhibitions, many of a campaign or propaganda nature are provided for. At the present time one on behalf of good roads is being conducted at the behest of a good roads association in a southern state. Frequently a farming problem, like the cattle tick or the boll weevil in the South, is attacked by pictures sent forth by the bureau. At another time it may be a health problem, like malaria or infantile paralysis.

The motto of the bureau is "The Eye Beholds." Dr. Holley's theory is that you can attack anything with pictures, ignorance, prejudice, restlessness; and that they afford the best and quickest way for carrying information and visual delights to masses of people.

The infant mortality rate in India is terrific; in some parts of that poverty-stricken land, two of every three children die in babyhood.

Co-operating with the authorities there, the bureau put on a picture campaign; and in some localities a huge reduction has been shown in deaths among infants. On the wall of Dr. Holley's office there is framed a draft for $125 representing penny contributions made by Hindoo women and children to show their appreciation for the work of the bureau. That work comprised pictures alone, along with others used to catch the eyes and hold the interest of the audiences those pictures showed how babies should be cared for. There was no lecturing, no "surveys" and no pamphlets which the illiterates couldn't read and others would not be able to understand.

The bureau has used pictures in a similar way for fighting tuberculosis among the Eskimos of the Arctic regions, as well as for carrying knowledge of the outside world to those remote peoples. The Eskimos at first were afraid of the pictures. Agents of the bureau had to make and display pictures of the people themselves before they would permit exhibitions of something that at first seemed to them to be supernatural.

Health campaigns have been made in Mexico, South America and many other countries.

But the philanthropic is only a feature of the bureau's work. It is just as ready to give world distribution to a film that tells the story of American machinery or other kind of product we have to sell, as to fight a disease. Thus manufacturers and trade associations use it as a clearing house for informing the world about our industries. The bureau requires the pictures to be truthful and permits of no mere advertising or boosting. For example, it will send out a picture supplied by an American hat manufacturer. It shows the details of making good hats in this country. But when shown it will probably be accompanied by pictures displaying hat manufacture in other countries.

MISS A. MARIS BOGGS,

Dean of the Bureau of Commercial Economics. A graduate of Bryn Mawr, she has given ten years of her life to bettering the world through the eyes of mankind. "The best-known woman in the world," says Dr. Holley who, with her help, founded the bureau.

"What we seek to do," says Dr. Holley, "is, first in such a case, to show people how hats are made and promote the making of better hats. If our hat industry is thus given a wider market, well and good.

"While we co-operate freely with trade interests we are in no sense commercial. We charge no fees, earn no money and declare no dividends.

"Our main purpose is to carry pictures, and the right ones—the kind that will enable them to enjoy to the full the rich blessing of eyesight—to people who wouldn't otherwise see them. We don't care where those people are or in what country, we want to reach them—the more remote they are the more anxious we are to get to them pictures that will lighten their lives, broaden their outlook and help solve their problems." The bureau doesn't produce pictures, except on a lim-

Few Know of Their Work

RUSKIN wrote that there are a hundred persons who can talk, to one who can think, and a thousand who think, to one who can see. To help the millions everywhere, who have eyes but do not or cannot see as they should, to enjoy the blessed gift of sight, is the life-work of a wealthy man who for eighteen years was blind. Through the organization developed by him and a girl he terms "the best-known woman in the world" more than 2,000,000 persons in all parts of the world see helpful, informative and entertaining "movies" every month. And not one has ever been permitted to pay a penny for the privilege. Here is a stimulating story of true philanthropy that, although under way for several years and world-wide in its operations, has been done so quietly that rarely has a line appeared in the public prints concerning it.

ited scale. Most of those it displays or distributes are contributed free, some by the movie people themselves, others by concerns or organizations interested in giving distribution to various kinds of information, and by the co-operating governments.

Dr. Holley's organization works with any other that wants to help, and when it finds another covering a field as it would do, it withdraws and seeks another. It competes with no one, plays no selfish game. It is, in fact, an international clearing house for motion pictures of an educational type, and it is the only establishment of the kind in the world. It is a world-circulating library for films, now handling more than 50,000,000 feet, with tens of thousands of feet of new film added every month.

"Motion pictures may revolutionize the thought of the world," says Dr. Holley. "Their importance lies not so much in the 'play' pictures we see in the city theaters, but in the fact that they constitute an international language. In India, where we fought infantile paralysis and at the same time gave the people there information about the rest of the world, about twenty languages and dialects are spoken. We could deal with them all in a language understood anywhere, the language of action.

"Nearly all civilized children get their mental start from pictures. From pictures they learn that a horse is a horse, a cat a cat and a dog a dog. Even written language began in the form of pictures.

"We are wrong in thinking that pictures are solely for children or for amusement only. They are the best educational resource for adults. The motion picture, I believe, will be the medium for universal education and understanding and then of universal peace.

"I know of illiterate boys who learned trades from motion pictures. They have pathological value, too. Some day, I believe, they will be found to supply the best treatment for some forms of mental disease. In an institution I saw a man who for three years had been in a strait-jacket. I tried pictures on him. At first he didn't respond. But I gave him a dose of pictures once a week for several months. Finally, one showing life on the farm caught and held his attention. He began to mend and now seems to be as sane as you or I. The picture awakened lost recollections of his boyhood days and enabled him to get a clutch on his thoughts.

"Don't give me the credit for building up this establishment. The person who deserves that credit most is Miss A. Maris Boggs, dean of the bureau. She did more than anyone else and does more now and will carry it on when I am gone. Miss Boggs, I am confident, is the best-known woman in the world. What I mean is that she has met and is known by more actual people than probably any woman that ever lived."

It is probable that you never before heard her name and will wonder why you haven't seen her likeness in the newspapers or on the screen. Her fame lies chiefly among the millions of folk who never see the rotogravure section of a Sunday paper and are ignorant of the fact that big theaters are devoted to screen productions. In building up and carrying on the work of the bureau she has traveled over most of the world and has confined her activities largely to those sections and peoples out of contact with up-to-date life. She has directed picture expeditions in the Arctic, among the Indians of South America and Mexico, in India and the Far East. She is now preparing for a summer trip into the Far North. It will take her to the mouth of the McKenzie River. She has been voted membership in a dozen or more tribes of Indians and other primitive peoples.

She met Dr. Holley in the office of the specialist who restored his sight. She had just taken a degree from the University of Pennsylvania and the year before had graduated from Bryn Mawr. She told her of what he proposed to do with pictures and she volunteered to help. For nearly ten years, since the bureau was started, she has given her time without charge, and, though not wealthy, has made liberal money contributions to the work.

Top—One of more than thirty traveling "movies" that go into all parts of the world and never charge a penny for exhibitions.

Oval, at left—In this way they take motion pictures to the lonely people of the Far North.

Top—A crowd viewing a free picture show provided by the most singular "movie" organization in the world.

Oval, at right—In the Far North where Eskimos are provided with "movie" shows and also are taught through motion pictures how to save themselves from destruction by tuberculosis, by the Bureau of Commercial Economics.

How aid is extended is shown by the aftermath of Miss Boggs's trip to the north coast of Hudson Strait, where the natives were dying out of tuberculosis. She established a line of stations whereby the people in that region could be regularly supplied with pictures. But when she did so there were no funds to continue operation. On her way back she met Lord Northcliffe, the English publisher, and told him of what she had done. He immediately wrote out and handed her a check for $10,000. Many other world-prominent men have volunteered support, men like Sir Thomas Lipton and John Hays Hammond. Sir Robert Borden gave them a private car which has right of free passage over all the railroads of Canada.

The bureau has the singular privilege of free transit for its mail through the diplomatic pouches that go out from most of the legations and embassies in Washington. On the day the writer talked with Dr. Holley he had dispatched sixty-four pounds of mail through the British embassy. In co-operation with foreign governments pictures have been sent and displayed to such regions as Nigeria and Tahiti.

The bureau is perhaps the biggest distributor of our government films not only in this but also in other countries. Being non-governmental it can serve as a clearing house for the films of all governments.

The bureau's organization was used by the government in selling Liberty bonds during the war, helping with the food campaigns, and since the war has been used to promote war risk insurance among the ex-soldiers.

Its exhibitions have often been witnessed by crowds of more than 50,000 persons, but as a rule it doesn't seek the audiences of cities, but the folk away from blazing electric lights and the range of the customary movie show.

One condition attaches to every film displayed by the bureau directly or through others: Not a penny must be charged or accepted for the privilege of seeing it. No hat-passing is even permitted.

The films accepted for distribution must have no selfish purpose to serve. They must be informative, soundly entertaining and constructively helpful.

You may wonder, as the writer did, why such work has not been written of more. It is due to the fact that the establishment, while perhaps the world's greatest publicity organization, has never sought publicity for itself. Much of its work is done through or with others, like the universities and colleges, which it encourages to get full benefit for the good will developed.

"Our satisfaction comes from knowing that during every day of the year, and almost every hour of the day and night, more than 100 audiences in every part of the world are viewing pictures sent out by us, and are thus benefiting from and enjoying the blessed gift of eyesight," says Dr. Holley.

The Fever of Spending Public Money

By WILLIAM E. BORAH
United States Senator From Idaho

THE people will have to make up their minds that they are not going to get any money for real internal development, or for taking care of those things which are so essential to the betterment of industrial and agricultural conditions, until we adopt a different program with reference to those things which really swallow up the vast sums of money which Congress appropriates.

The appropriation bill for the Navy carries $395,000,000. We are about to construct and are in the process of construction of some 16 capital ships, which cost about $40,000,000 apiece. I am perfectly clear that we could suspend the building of at least six of these capital ships without detriment to the country, and ultimately without weakening the Navy, and thereby save $240,000,000. If we could cut a hundred million from the Army cost and two to three hundred million from naval cost, we would be cutting our expenses and making a saving which would mean something.

It is impossible, perhaps, to estimate the world's debt. Some have placed it as high as $348,000,000,000. Our own indebtedness, our public debt, is about $24,000,000,000. We are appropriating about $4,000,000,000 or $4,500,000,000 for current expenses, and we are facing a deficit of some $2,000,000,000.

The fever of spending which we contracted during the war is still raging. The joy riding in the Public Treasury is still our chief delight. This to me is a greater menace than any condition of affairs which we faced during the war. War has its menace and its threatening problems, but none more menacing than the shameless waste of public funds and the laying on of unnecessary burdens upon a people already bending under a fearful load. Do we fully appreciate the situation, or must we confess our inability or unwillingness to deal with it?

This debt, which now rests like a mortgage in process of everlasting foreclosure upon the brain and the energy of the human family, really staggers computation, and in its demoralizing and deadening effect beggars description. We seek to estimate it in figures and speak to each other in terms of billions, but all this signifies very little. It is when you undertake to measure this debt in foot pounds of human toil that its magnitude becomes bewildering. The privation and the misery, the suffering and the sacrifice, the men and women bending in hopeless drudgery, the children starved in body and stunted in mind, the families discouraged and broken up, the pauperism, the crime, the suicide, which its ever-pressing weight and subtle tyranny imposes, place its size and its effect beyond our power to portray.

The most exacting taskmaster in the world is the public debt. The most remorseless cruelty which a community as a whole can experience is this ceaseless, never-ending struggle to meet its obligations. If it has any advantages to bestow, it bestows them upon the few and well-favored—those who are able to hold bonds and collect the interest. But it sits with the average citizen at his meals and accompanies him in his daily avocation to take from him all that he can be persuaded or driven to give and leaves him nothing in return.

I think the public debt a curse. It eats out the substance of the people, kills initiative, undermines and corrupts society, breeds discontent and disorder, and often destroys government itself. The immediate and most commanding task of all those who would see a composed world and prosperous and orderly communities and states is to devise ways and means to reduce it, if possible, and in the name of humanity to see that it goes no higher.

The most stupendous fact at the close of the war was the world debt. The most pressing and complex problem was how to stay its growth and, if possible, lessen its weight. But no move was made, nor has there been any move made in that direction in any of the allied or associated countries. The futile and absurd proposition that the cost of the war and the world's debt could be extracted from Germany was flouted before the people, while the expenditures for militarism and armaments were increased beyond anything ever before contemplated. With incontinent haste and reckless plunging we began to compete with each other in building for future wars.

With our huge debt already upon us, with our current expenses greater than we dare lay taxes to cover, we surge ahead—plunge ahead toward universal bankruptcy. When are we going to lighten these burdens? How are we going to do it? Where is the program? Have we lost our cunning in everything in God's tortured world save that of appropriating public money? There must be a change of program some time, and in my judgment at no distant time.

In our own country business is worried and discouraged by crushing taxes, while 3,000,000 workmen are seeking employment. Taxes and appropriations, appropriations and taxes, will not cure such conditions. Unjust and oppressive taxation—this will destroy the morale of the most self-poised and patient people in the world and shake the foundation of the most noble and freest institution ever devised by sage or patriot.

From a speech delivered in the United States Senate, February 17, 1921.

B'nai B'rith Leader Discusses the Jews

Leo Levi Takes Up Jewish Question as to Race, Courage, Exclusiveness, Intermarriage, Etc. Logic Versus Loyalty

TO THE pro-Jewish spokesmen who have filled the air with cries of "lies" and "slander," to those self-appointed guardians of "American ideals" who rule out with rare finality all those who would dare suggest that possibly there is a hidden side of the Jewish Question, it must come as something of a jolt to be reminded that in this series there is scarcely a line that is without high Jewish authority.

The Protocols themselves are written for centuries in Jewish authoritative teachings and records. All the plans which have been described from time to time in these articles are written in the fundamental laws of the Jews. And all that the ancients have taught, the modern Jews have reaffirmed.

The writer of these articles has had to take constant counsel of prudence in his selection of material, for the Jews have always counted confidently on the fact that if the whole truth were told in one comprehensive utterance, no one would believe it. Thus, bigots and minds bursting with the discoveries they have made, have never been feared by the Jews. They counted on the incapacity of the non-Jews to believe or receive certain knowledge. They know that facts are not accepted on proof, but only on understanding. Non-Jews cannot understand why human beings should lend themselves to certain courses. They are, however, beginning to understand, and the proof is therefore becoming more significant.

There are yet more important revelations to be made, always following closely the best Jewish sources, and when these revelations are made, it will be impossible for the Jewish leaders to keep silent or to deny. The time is coming for American Jewry to slough off the leadership which has led it and left it in the bog. Leadership knows that. Indeed, it is amazing to discover the number of indications that the attempts made to suppress THE DEARBORN INDEPENDENT have been made principally *to prevent the Jews reading it.* The leaders do not care how many non-Jews read these articles; but they do not desire their own people to read them. The Jewish leaders do not desire their people's eyes to be opened.

Why? Because, just now, only Jews can truly know whether the statements made in these articles are true or not. Non-Jews may know here and there, as their observations may confirm the printed statements. But informed Jews really *know.* And large numbers of the masses of the Jews really know. When they see the truth in all its relationships in these articles, the hitherto "led" Jew may not be so tractable. Hence the effort to keep the non-Jewish point of view away from him.

Calls Jews an Oriental People

IN SUPPORT of the statements that these articles have been based on Jewish authority, we quote today a series of declarations by one of the most able of the presidents of the B'nai B'rith, Leo N. Levi. Mr. Levi was American-born and died in 1904. He was a lawyer of distinction and attained the presidency of the international Jewish order, B'nai B'rith, in 1900. He took part in the international politics of his people and is credited with collaborating with Secretary of State John Hay on several important matters. The utterances here quoted were for the most made while he was president of B'nai B'rith, but all of them were published the year after his death under B'nai B'rith auspices. There is therefore no question of their Jewishness.

Non-Jewish defenders of the Jewish program have pretended to much indignation because of references that have been made to the Oriental character of certain Jewish manifestations. The references in these articles have been two in number, once regarding Oriental sensuality as it has been introduced to the American stage by Jewish theatrical panderers, and again in quoting Disraeli, the Jew who became premier of Britain, to the effect that the Jews—his people—were "Mosaic Arabs."

But it never seemed to have occurred to Leo N. Levi to deny the Oriental character of his race. Instead, he asserted it. On page 104 of the B'nai B'rith memorial, he excuses certain social crudities of the Jew on the ground "that hailing originally from the Orient and having been compelled for twenty centuries to live in a society of his own, he has preserved in his tastes much that is characteristically Oriental." Again on page 116, he excused the multiplicity of religious rites as being due to the fact that the Jew "drew upon his Oriental imagination for a symbolism that appealed to his ideal emotions." On page 312, he speaks of the Jews' "Oriental devotion to their parents." This easy recognition of the fact is commended to those bootlicking editors who, out of the vastness of their ignorance of the Jewish Question, have seen in the reference to Orientalism an "insult" to the Jews and an unfailing indication of anti-Semitism.

The Jewish Question! Ah, that is another point which pro-Jewish spokesmen hasten to deny, but they will be somewhat disturbed by the candor with which true Jewish spokesmen admit the Question.

In a strong passage on page 101, Mr. Levi says:

"If I have dwelt so long upon this subject, it is because I recognize that if the Jew has been denied so much that is rightfully his, he often claims more than is his due. One of these claims, most persistently urged, is that there is no Jewish Question; that a Jew is a citizen like any other citizen and that as long as he abides by the law and does not subject himself to criminal prosecution or civil action, his doings are beyond legitimate inquiry by the public at large.

"This contention on his part would certainly be well based if he claimed nothing further than the right to live in peace, but when he demands social recognition the whole range of his conduct is a legitimate subject of inquiry against which no technical demurrers can be interposed . . . . Nor must the Jew be over-sensitive about the inquiry.

The Jewish Question Not Imaginary

"THE inconsistencies and the unwisdom exhibited in the consideration of the Jewish Question are not to be found altogether on the side of those who are hostile to the Jews."

"Since then the refugees from Russia, Galicia and Rumania have raised the Jewish Question to commanding importance. Since then it has dawned on the world that *we are witnessing another exodus which promises soon to change the habitat of the Jews to the Western Hemisphere.*" (Page 59)

"The Jewish Question cannot be solved by tolerance. There are thousands of well-meaning people who take to themselves great credit for exhibiting a spirit of tolerance toward the Jews." (Page 98)

Mr. Levi also lays down rules for "the study of the Jewish Question," and he says that if they were followed the result "would be startling at once to the Jews and the general public." (Page 93) How far present Jewish leadership has departed from that frank and broad view taken by Mr. Levi, is everywhere evident.

Not that Mr. Levi was a critic of his people, but he was a lawyer who was accustomed to weighing facts, and he saw facts that weighed against his people. But he was pro-Jewish even in his most severe observations. He could make an attack on the rabbis, taunting them with the saying that "many of you are 'rabbis for revenue only,'" but he could also insist on Jewish solidarity and exclusiveness.

In this connection it may be interesting to see how strongly Mr. Levi supports the contention of Jewish leaders (as outlined in THE DEARBORN INDEPENDENT of October 9 and 16, 1920) that the Jews are a *race* and not merely a *religion,* a nation and not merely a church, and that the term "Jew" is biological rather than theological. This is specially commended to the attention of those dim-minded shouters of "religious prejudice," who come into action whenever the Jewish Question is mentioned. (Of "religious prejudice" there are many examples to give in future articles.)

"Certain it is that thus far the race and the religion have been so fused, as it were, that none can say just where the one begins and the other leaves off. (Page 116)

A Race, Not a Religion

ATTACKING the contention of the "liberals" or "reformed Jews" to the effect that "Jew" is the name of a member of religious denomination, and not of a member of a certain race, Mr. Levi says:

"Nothing to my mind is more pregnant with error than this postulate of unreason. (Page 185) It is not true that the Jews are only Jews because of their religion." (Page 189)

"The Jews are not simply an indiscriminate lot of people who hold to a common belief." (Page 190)

"A native Eskimo, an American Indian might conscientiously adopt every tenet of the Jewish church, might practice every form and ceremony imposed by the Jewish laws and the Jewish ritual, and as far as the religion is concerned, be a Jew, but yet, no one who will reflect for a moment would class them with the Jews as a people. If the truth were known, a very large percentage of so-called Christians would be found to be believers in the essentials of the Jewish religion, and yet, they are not Jews.

"It requires not only that men should believe in Judaism, but that they should be the descendants in a direct line of that people who enjoyed a temporal government and who owned a country up to the time of the destruction of the second commonwealth.

"That great event took away from the Jews their country and their temporal government; it scattered them over the face of the earth, *but it did not destroy the national and race idea* which was a part of their nature and of their religion."

"Who shall say then, that the Jews are no longer a race? . . . . Blood is the basis and sub-stratum of the race idea, and no people on the face of the globe can lay claim with so much right to purity of blood, and unity of blood, as the Jews."

"If I have reasoned to any purpose, the inquiry of rights in the premises is not to be limited to Jews as the exponents of a particular creed, but *to the Jews as a race.*" (Pages 190-191)

"The religion alone does not constitute the people. As I have already maintained, a believer in the Jewish faith does not by reason of that fact become a Jew. On the other hand, however, *a Jew by birth remains a Jew, even though he abjures his religion.*" (Page 200)

This is the view of such men as Justice Brandeis, the Jew who sits on the Supreme Court of the United States. Justice Brandeis says, "Let us all recognize that we Jews are a distinct nationality *of which every Jew, whatever his country, his station, his shade of belief, is necessarily a member.*"

Believing all this, Mr. Levi subscribes to the Jewish law and practice of exclusiveness.

Describing the state of the Jews, Mr. Levi says (page 92): "The Jews have not materially increased or diminished in numbers for 2000 years. They have made no proselytes to their religion . . . . They have imbibed the arts, the literature and the civilization of successive generations, but have abstained very generally from intermixture of blood . . . . They have infused their blood into that of other peoples but have taken little of other peoples into their own."

Marrying a Gentile Like Marrying a Negro

AS TO intermarriage between the Jew and non-Jew, Mr. Levi calls it miscegenation. "In remote counries, sparsely populated, the choice may lie between such marriages and a worse rela[illegible]." Those are his words on page 249. He does not advise the worse relation, but he has said quite enough to indicate the Jewish view of the case. He continues:

"It seems clear to me that Jews should avoid marriages with Gentiles and Gentiles with Jews, *upon the same principle that we avoid marrying the insane, the consumptive, the scrofulitic or the Negro.*" (Page 249)

This exclusiveness goes down through all human relations. The Jew has one counsel for non-Jews and another for himself in these matters. Of the non-Jew he demands as a right what he looks down upon as shady privilege. He uses the Ghetto as a club with which to bludgeon the non-Jew for his "bigotry," when as a fact he chooses the Ghetto for well-defined racial reasons. He condemns the non-Jew for the exclusion of the Jew from certain sections of society, when as a Jew his whole care is to keep himself unspotted from that very society to which he seeks entrance. The Jew insists on breaking down non-Jewish exclusiveness, while keeping his own. The non-Jewish world is to be public and common, the Jewish world is to be kept sacrosanct. Read the teachings of this enlightened leader of Jewry as published by the B'nai B'rith.

He favors the public school for non-Jewish children, not for Jewish children: they are to be kept separate; they are the choice stock of the earth:

"Because the government tenders free education, it does not follow that it must be accepted; if education be made compulsory it does not follow that government schools must be attended . . . . As a citizen I favor free schools, because the education they afford, imperfect as it is, is better than none, and society is benefited thereby; but as an individual I prefer to pay to support free schools and send my children to more select places." (Page 253) He speaks of the fact that "all classes of children frequent the public schools" as an argument against Jewish children going there.

"In my judgment Jewish children should be educated in Jewish schools." (Page 254) "Not only is it a positive and direct advantage to educate our children as Jews, but it is absolutely necessary to our preservation. Experience has shown that our young people will be weaned from our people if allowed to indiscriminately associate with the Gentiles." (Page 255)

Discussing the possibility of Jews losing their crude-

ness, Mr. Levi asks, "How shall we best accomplish that end?" Then he quotes the frequent answer: "Since the exemplars of gentility most abound among the Gentiles, we should associate with them as much as possible, in order to wear our own rudeness away." He meets the suggestion this way:

"If gentlemen were willing to meet all Jews on a parity because they are Jews, we should doubtless derive much benefit from such association. But, while it is true that no gentleman refuses association with another because that other is a Jew, he will not, as a rule, associate with a Jew unless he be a gentleman. As we are far from being all gentlemen, we cannot reasonably expect to be admitted as a class into good society. So, better keep by ourselves," concludes Mr. Levi. (Page 260)

His Opinion of Jewish Courage

THAT is, Mr. Levi admits the willingness of society to meet Jews on equal terms, as with all others, but not on unequal terms. And this being so, Mr. Levi holds they had better meet as little as possible, they had better keep apart; in the formative years, certainly, Jewish young people should be kept rigidly apart from non-Jews. The exclusiveness of which the Jews complain is their own. The Ghetto is not a corner into which the non-Jews have herded the Semites; the Ghetto is a spot carved out of the community and consecrated to the Chosen People and is therefore the best section of the city in Jewish eyes, the rest being "the Christian quarter," the area of the heathen. Mr. Levi himself admits on page 220 that there is no prejudice against the Jew in this country.

Certain wild-eyed objectors to the series of studies on the Jewish Question have made the assertion that THE DEARBORN INDEPENDENT has declared cowardice to be a Jewish trait. That the statement is false as regards this paper does not change the fact that the subject has been generally discussed in and out of army circles. If it ever becomes necessary to discuss it in these studies, the facts will be set forth as far as they are obtainable. But the point just now is that Mr. Levi has had somewhat to say which may repay reading:

"Physical courage has always been an incident, not an element, of Jewish character. It has no independent existence in their make-up, and always depended on something else. With some exceptions this may be said of all Oriental people. The sense and fear of danger is highly developed in them, and there is no cultivation of that indifference to it which has distinguished the great nations of Western Europe." (Page 205)

Were a non-Jew to call attention to this difference between the Jews and others, he would be met with the cry of "anti-Semitism" and he would be twitted with the fact that all his relatives may not have served in the war. Loudest to twit him would be those who served in what our soldiers called "the Jewish infantry," the quartermaster's corps in the late National Army.

It is to this aversion to danger, however, that Mr. Levi attributes the Jews' greatness among the nations. Other nations can fight, the Jews can *endure,* and that, he says, is greater. Note his words (the italics are his own):

"Other nations may boast conquests and triumphs born of aggression, but though the fruits of victory have been manifold, they have not been enduring; *and it may be truly said that the nation whose greatness grows out of valor* passes through the stages of discord and degeneracy to decay . . . . In the virtue of endurance I believe the Jews have a safeguard against the decay that has marked the history of all other peoples."

It appears, therefore, that the draft-dodger, if he can *endure* long enough, may yet come to own the country.

Jewish leaders have lately tried to minimize as "wild words" the disclosures made by Disraeli with reference to the Jews' participation in European revolutions. What Disraeli said can be found in his "Coningsby," or in the quotations made therefrom in THE DEARBORN INDEPENDENT of December 18, 1920. With reference to the German Revolution of 1848, Disraeli wrote—before it had taken place:

> "You never observe a great intellectual movement in Europe in which the Jews do not greatly participate . . . . That mysterious Russian Diplomacy which so alarms Western Europe is organized and principally carried on by Jews. That mighty revolution which is at this moment preparing in Germany, and which will be, in fact, a second and greater Reformation, and of which so little is yet known in England, is entirely developing under the auspices of Jews."

It is interesting, therefore, to hear Mr. Levi confirming from the American side those significant statements made by Disraeli.

Jews in German Revolution

"THE revolution of 1848 in Germany, however, influenced a great many highly educated Jews to come to America." (Page 181) "It is unnecessary to review the events of 1848; suffice it to say, that not a few among the revolutionists were Jews, and that a considerable number of those who were proscribed by the government at home, fled to the United States for safety." (Page 182) These German Jews are now the arch-financiers of the United States. They found here complete liberty to exploit peoples and nations to the full extent of their powers. They still maintain their connections with Frankfort-on-the-Main, the world capital of International financial Jewry.

With these quotations from the speeches and writings of Leo N. Levi, a famous president of the B'nai B'rith, it would seem to be a fair question as to the reason for the denial and denunciation which have followed the making of these statements in the course of this series of studies. Leo N. Levi studied the Jewish Question because he knew a Jewish Question to exist. He knew that the Jewish Question was not a non-Jewish creation but appeared wherever Jews began to appear in numbers. They brought it with them. He knew the justice of many of the charges laid against the Jews. He knew the impossibility of disproving them, the futility of shrieking "anti-Semitism" at them. He knew, moreover, that for the Jews to solve the Jewish Question by departing from the peculiar racial traditions of superiority, would be to cease to be Jews. Therefore, he threw his whole influence on the side of the Jews remaining separate, maintaining their tradition of The Chosen Race, looking upon themselves as the coming rulers of the nations, and there he left the Question just about where he found it.

But in the course of his studies he gave other investigators the benefit of his frank statements. He did not put lies into the mouths of his people. He was not endeavoring to maintain himself in position by prejudiced racial appeals. He looked certain facts in the face, made his report, and chose his side. Several times in the course of his argument, his very logic led him up to the point where, logically, he would have to cast aside his Jewish idea of separateness. But with great calmness he discarded the logic and clung to the Jewish tradition. For example:

"The better to facilitate such happiness in every country and in every age, various kinds of organizations have existed as they exist today. The Jews have theirs.

Where Logic Opposes Loyalty

"FOR many reasons they are exclusive. In theory they should not be so. In our social organizations we should, in deference to the argument which I have already named, admit any congenial and worthy Gentile who honors us with his application. But what may be theoretically correct may be found practically wrong. It certainly is a wrong to exclude a worthy person because he does not happen to be a Jew; but on the other hand, where are you to draw the line?"

This is frankness to a fault. Of course, it is wrong, but the right is impractical! Logic goes by the boards in the face of something stronger. Mr. Levi is not to be blamed for having gone to his tribe. Every man's place is with his tribe. The criticism belongs to the lick-spittle Gentile Fronts who have no tribe and become hangers-on around the outskirts of Judah, racial mongrels who would be better off if they had one-thousandth of the racial sense which the Jew possesses.

This brief survey of the philosophy which Mr. Levi both lived and taught, and which is shared by the leaders of American Jewry, is in strict agreement with Jewish principles all down the centuries. In his published addresses Mr. Levi does not touch upon all the implications of the separateness which he enjoins upon his nation. Why do they keep by themselves? What is it that keeps them distinct? Is it their religion? Very well; let us regard them as a sect of religious recluses and wish them well in their endeavors to keep themselves unspotted of the world. Is it their race? So their leaders teach. Race and nationality are strictly claimed. If this is so, there must be a political outlook. What is it? Palestine? Not that any one can notice. A great deal may be read about it in the newspapers, the newspapers in turn being supplied through the Associated Press with the Jewish Telegraph Agency's propaganda dispatches; but no one in Palestine notices the Land becoming more Jewish. Jewry's political outlook is world rule in the material sense. Jewry is an international nation. It is this, and nothing else, which gives significance to its financial, educational, propagandist, revolutionary and immigration programs.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

A second book, containing the second twenty articles, will soon be ready and may be ordered now.

Jewish World Notes

"We have received a publication issued by a committee of Jews in New York, the purpose of which is defensive propaganda. If the Jews get in bad repute in America it will be their own fault. As a general proposition, America has felt kindly toward this remarkable race. They have been persecuted in many nations. America gave them refuge, liberty and opportunity. Very well, now let the Jew behave himself. Let him stop his effort to destroy the American Sabbath. Let him cease to prostitute the American theaters and motion pictures, which he controls, to the undermining of the character of America's youth. This he is doing by the wholesale, out of perversity or the love of money or both. The way salacious scenes, presenting the grosser phases of sex life, are lugged into the motion picture is becoming a scandal and an outrage on American decency. We will treat these sons of the flesh of Abraham well, if they will let us. But America is being forced to take cognizance of certain perversities in society at the end of which stands the Jew. These things must go, or Americanism suffer irreparable injury. We are willing to hear the Jew's defense, but let him cease to contaminate America's life, or America will have to deal with him sternly to protect itself."—*Western Recorder,* reprinted by the *Christian Statesman.*

Germany cannot pay indemnities, but Kuhn, Loeb & Company are receiving large shipments of gold from Europe, and it is supposed to be, if not Russian gold, then German. This firm has many German connections unbroken by the war.

The *Medizinische Klinik* quotes from a letter in the Vienna *Allgemeine Zeitung,* written by an Austrian physician who has recently returned from Russia. He says that the final step in the transformation of medical practice into a state function has been taken recently by the Soviet government. This prohibits private practice by physicians. This was the last private business still permitted, as arrangements had to be made for free dispensaries at available points. The physicians living near the dispensaries are given charge of them, at a fixed salary. The sanatoriums and private hospitals had been taken early for the purpose, retaining their former proprietors as directors. The writer adds, "The middle classes whose fate in all socialistic movements is to be ground between the millstones of capital and labor, have simply been ground out of existence, or crushed down into the proletariat. The forbidding of private practice now consequently has scarcely any significance for the physicians of Russia."

Verily, the prophecies of the Protocols are being fulfilled.

The Hearst papers, loudest to demand breaking the trade treaty with Russia in 1909 because the Jews wished it, are now demanding trade with Bolshevik Russia. To please the same people?

The following is translated from the *Asashi Shinbum,* of Tokio, Japan:

"There goes a rumor that a certain Jew has spent many tens of millions of yens to spread in Japan Bolshevistic ideas. The police has made an investigation, the results of which are kept a secret.

"We have interrogated the authorities, who gave the following answer: 'There are in Yokohama about two hundred Jews and in Kobe more than a hundred. They are also numerous in Tokio. As to China, there are about 800 in Shanghai alone. They have much influence in religious, intellectual and economical circles. In California, the Jews, or their henchmen, are at the head of the anti-Japanese movement. They exercise a considerable influence not only in these countries, but also in Japan and we are watching them closely.'"

George Pitt-Rivers' pamphlet, "The World Significance of the Russian Revolution," having a prefatory letter by Dr. Oscar Levy, may be had in this country of The Beckwith Company, 299 Madison avenue, New York.

In Denver, recently, a 13-year-old boy stole some candy from a grocery store and is still in prison for the theft—more than a year ago. Julius Josephson embezzled $6,027 and was released in 50 days. The man from whom Josephson embezzled was besieged day and night by "influential Jewish families" and rabbis. The boy who stole the candy was not a Jew. A Denver paper printed a list of Jews who were alleged to have contributed to a fund for Josephson's release.

When hemp was cut by hand.

Hemp shocked waiting to be hauled.

The Plant That Sews Our Shoes

WHILE the Pharaohs were laying the foundation stones of the pyramids, the cave-dwellers of Europe were wearing rough garments made from a common fiber plant. Today the same fiber sews our shoes and rigs our ships. It was the plant from whose resinous gums the Arabians obtained the intoxicating drug *hashish* even as the Hindus do today.

Aeschylus is credited by Boyce, writing two decades ago, with stating that "the plant was burned and used for vapor baths," while Herodotus says, "the Scythians were intoxicated by inhaling the fumes of the burning seed." In Sanskrit it was termed *sana,* meaning a hollow reed-like plant or cane; Persians named it *canna* and *kanap;* the Greeks gave it the appellation *kanna*—a reed and anything made from it; but we Anglo-Saxons by introducing a number of variations have come to call it *hemp.*

Hemp today is grown in Europe, Asia and America and its fibers are used not only to make fine lacy threads which rival silk, but to constitute the strong ropes and yarns used on shipboard. The great tensile strength and resistance to water and wear make hemp a great favorite with the sailors who use so much cordage of all kinds. The hemp family like all others has numerous branches each one serving its purpose, and while the Japanese grow hemp for birdseed we are raising it for the fiber which is employed in sewing harnesses and shoes; for making sacks and sewing the housewife's broom as well as for fine and coarse wrapping twine. In the Navy it serves for sail thread, marlines, houselines and for serving or covering steel ropes and cables to prevent the disintegrating action of the salt water. The furniture makers wrap springs with hemp to insure upholstery against rust and tie the wool in place in mattresses with hemp thread.

Hemp grows from the equator to the latitude of 60 degrees and no other fiber plant is so adapted to the wide soil and climatic conditions and the rude arts of the semi-barbaric husbandman, yet none is more responsive to culture or better rewards the skill of the weaver and spinner. Lace threads are spun from hemp by hand to the fineness of 600 miles for each two and one-half pounds of fiber while cotton and wool yield only 350 miles for the same amount of fiber. This alone would make hemp popular but no machinery has yet been invented which can compete with hand spinning at a reasonable cost.

Perhaps because of the persistency with which it has been studied and cultivated for thousands of years, hemp is still used for making fine threads and cloth although its usefulness for making cordage, seines and fishlines has not been neglected. Introduced into America in 1629 it had obtained a strong start, but the invention of the cotton gin in 1792 made cotton growing so much more profitable that except for Kentucky hemp was almost exterminated. The invention which made one industry delayed the growth of another for a century. Costly hand labor made hemp growing impossible and twenty years ago only a few thousand acres were grown in the entire United States.

Then something happened. A scarcity of sisal fiber in Yucatan threatened a twine shortage in the country and urged by this necessity a few earnest workers began the promotion of an almost-dead culture.

Previous to 1910 no plant received less attention from inventors. "The industry still lives in the bluegrass region of Kentucky in all the pristine glory and primitive practices of its establishment a hundred years ago," wrote Boyce, reviewing hemp in 1900.

But to understand the difficulties let us examine more closely the plant itself. Grown for fiber the stalks reach a height of from eight to ten feet in 80 days. Tourists, unfamiliar with the crop and driving through the new hemp region of Wisconsin often amuse the residents by mistaking it for ragweed. A hemp field gives forth a half-bitter, half-unpleasant odor and the finely cut leaves do indeed resemble the roadside weed. The reed-like stalks are colored a yellowish green and except for the top leaves are smooth and glossy. Just beneath the greenish outer coat, however, and buried in the gummy matter of the bark, lie the strong fine fibers and it is in removing them from the wood part of the stem that the difficulty is encountered.

European and even the old Kentucky cultivators used to soak the stalks in specially constructed ponds or tanks after they had laboriously cut their crop with hand sickles. The water soon decayed the gums and then when the hemp was dried it was possible to separate the fibers from the partly rotted stalks. Now the fiber crop is spread on the ground and allowed to undergo the action of rain, sunshine and dew until the rotting or "retting" is completed. Less labor is required although some of the quality is lost.

After drying in the old days the hemp was taken to the "brake" where a man worked hard and long all day to brake a hundred pounds of fiber or in other words to separate the fiber itself from the stem or "hurds." Machinery in the new hemp mills of Wisconsin does the same work easier and cleaner at the rate of one thousand pounds an hour or one hundred pounds in six minutes.

In 1908, R. A. Moore, plant breeder at the University of Wisconsin, became interested in hemp. He proved shortly that it could grow in his state and while he dreamed of its possibilities he realized that unless machinery could remove the hand-labor nothing could be accomplished. Large machinery companies who were feeling the twine shortage and even individuals responded to the call for harvesting machinery and with interest aroused the plant breeder turned over the work to A. H. Wright, whose reputation has earned him the nickname of "The Hemp Man."

In September when harvest time comes, a machine cuts the tough stalks and even spreads them on the ground outside the track of the tractor. Five years ago the spreading was done by hand. A space of a month or six weeks elapses before the retting is completed and another machine gathers up the stalks and ties them in bundles. This is still done by hand in some instances but the large percentage of the crop is harvested by farmers with no more energy expended than is needed in an ordinary grain crop. The farmer's work is completed when he has hauled and stacked his crop at the mill.

In 1920 Wisconsin valued her hemp crop at more than a million dollars and twenty-eight mills engage several hundred men from September until July breaking the crop and preparing it for the spinning mills.

The little mills out in the country villages are unique and interesting. From the stackyard, hemp is fed into a long oven nearly two hundred feet long where hot blasts of air properly dry the stalks. The new "brake" is a series of corrugated rollers and shakers which separate the fibers and hurds much better than the old hand implement. A large revolving cylinder with many teeth combs out the hurds and leaves the hemp fibers in long silky masses ready to be baled and bound.

Everything inside the factory is covered with lint and dust and in spite of the ventilating fans the mills are tremendously dirty. Not only do the fans ventilate but they suck out the refuse of the brake and throw it into the fire under the boiler. Little coal is used, for the hurds burn like tinder and their presence about the factory makes it very necessary that the night watchman be ever on the alert for smoldering fires which suddenly break out in such fury that the factory is wiped clean before help can arrive. Fires are still rather frequent in spite of the fireproof mills now replacing the old wooden structures.

After watching the fire under the boiler in such a mill I made my way to the baling room. The foreman presented me with a handful of the fine silken strands and to test their strength I attempted to break a few twisted strands. After several vain attempts in which my hand suffered more than did the fiber, I glanced at the man who was smiling keenly at my failure.

"Try to break a single fiber," he suggested.

But even that was too strong and I began to realize more fully why it was, rope made from such fiber challenges the strength of steel.

The fiber crop of the ancients has at last found its place in the field of modern industry.

The crop spread out to dry.

From rough fiber to fine thread.

"Cutting Up Old Circus Money" VI. Snakes and Small Boys

By HARRY BARNET

"'GOVERNOR,' when did you learn to ride a horse in a circus ring?" was the question I asked John F. Robinson at the beginning of this interview. We were seated on the ring bank in the training barn at the winter quarters of his circus in the Little Miami country, near Cincinnati. I turned loose the query with the hope that he would dip into his memory, and pull out of it something that would give me an idea of what youngsters who traveled with the pioneer wagon shows did as a matter of every-day routine and amusement. No one seems to have had much to say on that subject.

And I queried the right man. No one is better able to answer the questions I had in mind.

"When I was so little that I couldn't sit on a pony," the "Governor" replied to the question I asked, "and to keep me on pa had to tie my legs to the surcingle and the stirrups, I rode races in the ring.

"In those days, you know," he went on, "we only had one ring. There was no hippodrome track between it and the seats, like we have in these days. The tent was so small that the seats came almost to the ring bank. The performances always were brought to a close with races. Necessarily they were run in the ring. Boys on ponies could run them better there than men could do it on horses, so these races always were between boys on ponies. My cousin rode one of the races with me. He was only a few months older than I was, but in his mind and his size he was a good deal older, and I thought he was older. One day in Augusta, Georgia, when we were sitting in the dressing room waiting our turn to go in, he was showing me how to hold my reins. He would whip my pony, and I would jerk him, and seesaw him, and I got my pony worked up until he was mighty restless.

One of the repair shops at winter quarters.

"At last, he couldn't stand the punishment any longer and he went out under the side canvas. Of course, I hit the side canvas and the guy ropes, and that threw me back on to the pony. At the same time it broke my hold, and I fell around under the pony. You can tell how small I was. This was a small pony, and I was hanging down underneath him the whole length of the stirrups, and my whole body and legs, but my head didn't touch the ground. I had long, curly hair, and when this pony ran down the street like old fury, it looked as though every time his front feet came up they were knocking me on the head—and, in fact, they did it two or three times.

"In those days, towns in the South used surface drainage; they had a big ditch in the middle of the streets, and three or four smaller ones on the side of the main ditch.

"Well, the pony ran about a mile that way, and everybody in the circus was after us, and everybody in the streets was chasing us, but at the same time they couldn't see us until the pony got by the stores and one thing and another, and the ditches made chasing us a hard job. At last, an old darkey ran his dray across one of these streets, and jumped across the ditch. When he got on the other side he caught the pony. So after it was all over there was nothing the matter, only a big sensation; everybody thought I was killed, and I wasn't even scared. The reason I remember it so well was because I had sore eyes then, and pa used to pour molasses into them every day to cure them.

"I was only a little older when pa started to teach me to ride on old 'Billy,' a mare that we had with the show. And he had to jolly me along a good deal to get me to learn to ride. While I was ambitious, yet I was such a tiny boy that I didn't realize what I was doing.

"But while I did excel any of them in riding and tumbling during my boyhood, I never was much of an athlete. I never had any ambitions to go into the air—I always was afraid of tumbling too far. While at the time I had made up my mind that I wanted to do something else with the show, I knew for the time being I was in for riding and tumbling, and I thought I would go as far as I could.

"But getting up on a horse and turning somersaults was a hard proposition for me, though I had the crude appliances to keep me from getting hurt. We had a mechanician—a pole attached to the center pole at an angle, and a rope running down from its end. I tied the rope to my belt, and if I fell I was left dangling in the air until 'Billy' came around again under me. But somehow or other, I didn't have sand enough to flop over at the start, and pa jollied me along every way he could. He tickled me a lot, too, with the lunge whip, but still I couldn't get over.

"'If you will do the somersault once,' he said one day, 'you will break the ice, and we'll quit for the day.'

"He knew that if I did it once," the "Governor" said after he had paused to chuckle, "there would be no more trouble. Finally, he said he would give me a couple of ponies, and harness and a buggy if I would turn a somersault. I accepted them, and then I knew I'd have to turn that somersault. I got up and did it, and it wasn't very long before I could do a somersault on a horse as well as I could roll over on the ground.

"After I got the ponies, it wasn't very long until I was riding the two of them in the ring. I wore a monkey suit with a monkey mask that had eyes I could roll and wink with a string. In the South, the Negroes thought I was a real monkey, you know, and I always finished that act by jumping off the ponies, and running up into the seats among them. That frightened the Negroes almost into a panic, and they scattered all over the canvas to get away from me. Then I dropped down between the seats, and walked along the side canvas to the dressing room.

"Well, one night when I dropped through the seats I landed right on a dirty, rusty rake, lying there with the prongs up. One of the prongs ran through my foot. It hurt me so that I couldn't do anything for a few seconds. Then I was too stubborn to ask anybody to help me. With the long handle to the rake in my road, I couldn't get the prong out of my foot. Finally, I stood up, put my other foot on the rake handle, and gradually worked that prong out of my foot. It took quite a lot of exertion to do it, too.

"I went to the dressing room, and I don't remember whether my foot bled or not. Anyway, I dressed and went to the hotel with my mother. It was wintertime, cold and chilly, but I never said a word. Next day the instep was swollen, and as sore as a boil. There had been nothing done to the wound, you know. Within a day or two there was a raised place on my foot as big as your fist, and I was sick and chilled all the time. One day I tried to put on my tights, but my foot was so swollen by that time that I couldn't get my foot through at all.

"The thing hurt me so that the tears were running down my face. One of the performers asked me what I was crying about, and I showed him my foot. I guess it was then about a week after the accident happened, and you can imagine what kind of a foot I had. It never had had any attention. The performer told my mother about it, and she came to the dressing room. I showed her my foot and she sent for pa. He had me taken to the hotel. I hadn't rested since the thing happened, either awake or asleep, it hurt me so. I was out in the cold every day, walking on this foot, putting on tights and old canvas pumps, my feet cold as ice most of the time, and it was time for something to happen.

Effects of a "blow-down." Windstorms sometimes level the tents with but little or no warning.

They laid me on a couch in the hotel in front of the fireplace, with my foot on a pillow. I lay on my back while the doctor lanced it. There was no such thing then as hypodermic syringes, and morphine was unknown. The only thing we ever had heard of was chloroform, and we were afraid of it. When he drew his knife across the raised place, the matter and pus came out like a fountain, an inch or two inches high. I was so relieved that I dropped to sleep before the doctor had wiped his knife. Then he dressed the wound, and next day I was back in the ring. Nowadays, if that would happen to anybody he would have lockjaw, and be dead in a day or two. So you can see, in old days, kids around the circus didn't have a very easy life.

"We always looked like a county fair, moving from place to place," the "Governor" continued without the necessity of questioning. "There were a lot of fellows who didn't belong to us following the show. They were traders of all kinds, who worked among the crowds that were attracted to the show.

Worn-out sleepers overturned along the winter storage tracks for the circus cars.

"There were some pretty decent fellows among them. One of them was a buggy trader. We weren't very old then—my brother and my cousins—and for some reason mother stayed in Augusta, Georgia, for a while. Pa didn't have much time to look after us, and we did pretty nearly as we pleased.

"It was mighty cold weather, and this trader never had less than six buggies tied one behind another as he went from town to town. We used to fill a buggy apiece with fodder and straw at night, hide in the bottom of it, and go to sleep while he drove from town to town. Otherwise we would have to sit on the seats of the baggage wagons all night long.

"One morning we woke up about six o'clock, and looked out from our nests. The trader had stopped, and was talking to a planter. We went to sleep again, and it was nine or ten o'clock when we woke up. We were in the same place. The planter had invited the trader to stay there for a few days while he helped him to sell a few buggies.

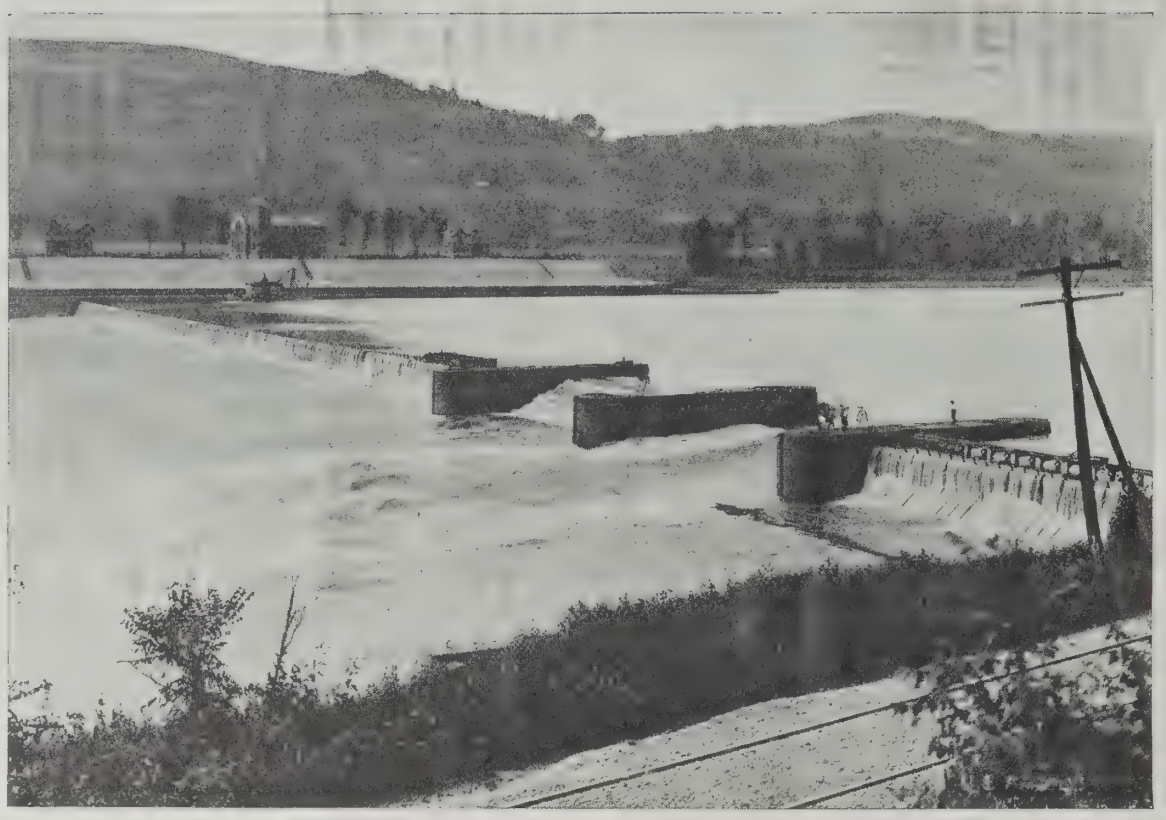
"Well, it was eight or ten miles to the town where we were to show that day, and there was nothing to do but to walk that distance. We weren't giving parades in those days, so we didn't have to be there before the matinee. We got into the town about noon. I grabbed my tights, and the other boys did the same thing, and we started out to find a mammy to wash them for us. We found one, but she only had half an hour to do it, and get them ironed. Well, she couldn't do it all, so I got her to wash my tights, and wring them out. I took them to the dressing room wringing wet.

"It was an awful cold, blustery day. I don't think any of us had washed our hands and faces for a week—it was too cold to do it. We had been standing over the fat pine knot fires on the lot until we were as black as darkies. As I was putting on these tights just before the performance, the wind was blowing as cold as could be through the dressing tent and I was shivering. Every time I took hold of the tights to pull them on my hands were so dirty that when I let loose of them there was the whole print of my hand on the legs of them. By the time I got them on they not only were stretched five times too big for me, but they were blacker than they were before I had them washed.

"Pa came in just as I finished putting on the tights. He saw me standing there shivering, and how dirty I was. The first thing I knew he grabbed me by the back of the neck, stripped me, and stood me head first in a bucket of cold water. Then he commenced to scrub me with a blacking brush and a bar of that old-fashioned resin soap. He nearly scrubbed my skin off—that resin soap was awful stuff.

"The other boys stood around, laughing and giggling at me. They thought it was a pretty good joke. When pa got through with me he shoved me away. The next instant he had one of my cousins, who was a little bit older, standing on his head in a water bucket. He got the same dose. Then it was my turn to giggle and laugh. By this time the older boys saw what was coming, and they hustled around, and got buckets and tubs and pails and soap, and when pa got through with my cousin, and looked around to get the next boy in line, there they were, all sitting in a row as naked as the day they were born, grinning at him, and as clean as they could be. Then pa sat down in his old leather-seated chair and laughed.

"But that method of getting from town to town without riding on the baggage wagons gave me an unreasonable fear of snakes," the "Governor" said, "and of the people who handle them. That may seem to be a queer statement from a man who has owned thousands and thousands of reptiles, from eighteen and twenty-foot snakes to little fellows that 'Hiki' used to eat in the side show at every performance.



"The first time we went into Texas and Indian Nation in the early 50's, there were five or six of us boys with the show. Before we left Texas pa bought us some mustang ponies to ride from town to town. And after the show was over at night we would ride fifteen or twenty miles, then lie down on the prairie and sleep until sunrise. Then we would get up, and ride the rest of the way to the next town. Sometimes it would take hours for the baggage wagons to make that distance. After a while, one boy would ride his pony, and lead another fellow's pony one night, and change about the next night. Then we could get in the baggage wagons and sleep all night long. I had a very wild pony, as black as the ace of spades. One night when my cousin started to lead my pony, he carelessly tied the halter to his wrist. He wasn't very far from town when he dropped to sleep, and slid off his pony.

"That scared my pony and he started off on a run, dragging my cousin probably a mile or more over what was named a 'hog wallow prairie,' which was nothing more than bumps and hollows, like the hogs had been there rooting and hunting around. By the time he got the pony stopped my cousin had no clothes left on him, except the collar of his shirt, and not a particle of skin from his knees to his head.

"This happened where there was no water, and when his father found him, and commenced to look around for something to wash him in, he couldn't think of anything else but whether anybody around the show had any liquor. Almost every man on the wagons carried a bottle of whisky, and they poured it all into one bucket. It made about a bucketful, and my cousin was washed in that. You can imagine how much misery that young fellow went through. It took him about three or four weeks to get the sores pretty well healed up. And that put a stop to us trading off for the chance of sleeping in the wagons. Every fellow had to ride his own pony, and even that ended in a short time. Of course, the custom had to go out in a spec-

(Concluded on page 14)

Constructing a Canal Out of a Great River

THE RUSH OF WATER THROUGH A LOWERED "BEAR-TRAP"

By HARRY PENCE

THE Ohio River is officially declared by the Department of Commerce to be the "most important commercial stream" in the United States. It is a fraction more than 968 miles long from Pittsburgh to Cairo, Illinois, between which the air line is less than 540 miles.

This considerable difference means that the course of the stream is winding, a characteristic of all rivers in which the Ohio River is not extreme. The explanation is that in the earth's formative period the waters that accumulated along what became its course first formed lakes in the deeper valleys at irregular points and, as these filled, the higher sought outlets into the lower pools. These connecting links, although they often cut deep into the earth, became shallow as soon as they drained the lakes of which they were the outlets.

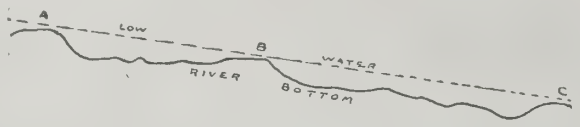
Modified by the natural processes of centuries, during which the current cut its way toward what is now the mouth of the river, and silt, or river mud, became deposited along the banks, the Ohio still remains a succession of pools connected by shallow stretches, or shoals, which, during the drier seasons of the year, long made navigation possible only for flat-bottomed boats of small draft, and were occasionally impassible even to these.

To meet such conditions boats were designed that, in the vernacular of the day, were able to "run on a heavy dew" and old-time pilots tell of instances in which they had to slow down so as not to run over horse-drawn vehicles fording the river.

This impediment to navigation was greatest near the source, where the fall was greatest, especially where there were rocky instead of sandy bottoms. In the first hundred miles of the Ohio the slope is a foot to the mile. In the next 270 miles the average is 5.7 inches, which is about the average of the entire stream. The lower stretches have a lesser fall and the advantage of an augmentation of the volume of water from the tributaries of the river.

Dam Is Built in the Ohio

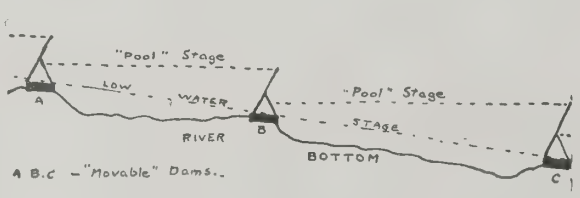
BEFORE the improvement of the river was begun, the number of days in the year upon which navigation on any considerable scale was possible in the upper stretches seldom exceeded a hundred and sometimes fell below that. In the middle reaches there were about that number of days of interruption to traffic on account of low water—and the demand for an adequate channel was greatest where the interruption was most frequent.



The plan to improve the channel of the Ohio River owes its inspiration to the example of the Monongahela River, one of the two streams the confluence of which at Pittsburgh makes the Ohio. There were rich deposits of "coking" coal along the Monongahela in mines close to the river and the mills and factories of Pittsburgh needed this coal in the largest volume and at the cheapest price it could be delivered. A private corporation was formed, French achievements in the same line studied and the Monongahela, which, in its original condition, was less adaptable for navigation than the Ohio, was converted into a canal by means of a series of dams, passage around which was effected through locks much the same as those in the Panama or the New York Barge Canal and at Sault Ste. Marie and differing only in size and mechanical refinement from those in vogue on the old canals now abandoned. This enterprise was entirely successful. The tolls were light, but returned a profit until the Federal Government took over the work and eliminated all traffic charges.

To complete the canalization of the Monongahela a dam was built in the Ohio, a few miles below its source, which provided a pool stage in the harbors of Pittsburgh.

There have been few government improvements that have more thoroughly justified themselves, economically, than has the Monongahela River. In addition to supplying the plants in the Pittsburgh district with fuel at all times when the advantage could scarcely be measured in money, the determinable economy is glaring. The saving in the cost of coal transportation in the year 1919 was an amount greater than the cost of the original construction of the locks and dams and in the year 1920 a twenty per cent increase in the volume of traffic made the economy even greater.



Heartened by this example the Federal Government undertook the present project of a similar canalization of the Ohio River to a full nine-foot stage at all seasons of the year from Pittsburgh to Cairo, so that the only interruptions to navigation would be extreme floods and running ice—impediments about as formidable as storms to the railroads.

The method employed is, in reality, very simple, if it can be properly explained. In its original condition the river, during low-water stages, was somewhat like this:

There may have been and probably was water enough to allow navigation between "A" and "B" and between "B" and "C" but no boat of any size could get from "A" to "C" or from any point between them to points outside. They had the choice of operating in very limited stretches of the river, or, when there was not sufficient business in communities between which navigation was possible, tying up and waiting for higher water.

The plan for overcoming this handicap, which comprises the erection of fifty-three dams and the creation of the same number of "pools," between which communication is made easy by means of locks, is in essentials like this:

There is much that is technical, very technical, about the canalization of rivers. Engineers have spent their lives studying the matter and there are several large volumes devoted to it, but here we are concerned with the simplest outlines, which, with the illustrations, ought to bring understanding to one who has never seen any of the work and has no previous knowledge of its principles.

The second diagram adds to the first three "movable" dams, each of which arrests the flow of water till it rises to a navigable stage at the foot of the dam above. On the river this is called "slack-water" and the term is used to distinguish traffic between dams from "Open River" or "Open Channel" navigation.

Why It's Termed "Movable" Dam

THE term "movable" dam is used because the dams are not built of masonry or concrete, but are composed of a large number of separate wickets, or heavy wooden planks pivoted on a frame of metal with a brace that holds them up inclined slightly downstream. There are technical reasons for this which we may well take on faith. The frame and brace are so devised that when the river is high the wickets constituting any dam can be lowered and boats pass through the open channel without the necessity of "locking through." At such times only the shore work indicates that a dam exists.

The next essential unit of the lock-and-dam system is the lock. It is not often that the passenger on a steamboat sees more of the lock than what obtrudes above surface. The lock-chamber is the space between two parallel walls at right angles to the dam and two end gates, one above and one below the dam. The upper gate connects with the upper pool and the lower gate opens into the pool created by the next dam down the river. The downward bound boat enters the lock after the chamber has been filled to the level of the upper pool. Then the upper gates are closed and the water allowed to flow out of the chamber till it is level with the lower pool, when the lower gates are opened and the boat continues on its way. To pass the upstream boat the processes are reversed. A boat can "lock through" a well-regulated, properly manned lock in ten minutes, if the chamber is at the right level, or fifteen, if it has to be filled or emptied first.

This, in brief, is the method by which the Ohio River is being made into a canal—dams are converting the open channel into a series of pools and access from pool to pool is had by means of locks.

There are incidental features to the locks and dams that are worthy of attention. All the dams on the Ohio River are equipped with "Bear-Traps" or two large weirs which can be quickly lowered to permit the passage of small heads of water that might otherwise overflow the dams, but which are known to be of too short a duration to justify the lowering of the wickets. They are operated almost automatically by a most ingenious control of the water under two great, overlapping gates, like cellar doors, which are regarded as emergency or safety gates of the dam.

The wickets that constitute a dam are large and heavy. They are more than seventeen feet long, three feet wide and correspondingly thick. They are heavy, but, like all heavy substances, are more easily handled under water. They are, however, too ponderous to be manipulated by hand and are raised and lowered by the crew of a "maneuvering boat" equipped with the necessary machinery. A trained crew can raise a dam in a few hours and lower it in less time. The raising of the wickets becomes a more difficult job as it reaches its end, because the rush of water through the narrowing opening acquires a great momentum. Men skilled at the task, however, handle it in a manner that would amaze the average land-lubber. A photograph on the next page shows the "maneuvering boat" and crew at work.

Forty Years' Work Nears End

AS WE have had before us a view of each of the essential units of an Ohio River lock-and-dam, it will probably give a clearer idea if we consider the photograph showing all these units in their proper relation. The power necessary to operate the machinery of the lock and to light the lock and the dwellings of the lock-master and the engine-man is generated in the building shown on the right. Both gates of the lock chamber are closed. These gates are of the so-called "recess" type, differing from those shown in the above picture in that they are each one steel-truss barrier on a track and are drawn back into a recess in the bank. The other gate—the "mitre sill"—is a pair of great swinging doors that, even when they are closed, point a little upstream, because there is whence the greater pressure comes, and the greater the pressure the tighter they close. Some locks have one type and some the other.

This is perhaps the place to correct a misconception general among those who have read of, but never seen, an Ohio River lock in action. The flow of water into and from the lock chamber is not through or governed by the gates. There are conduits through the outer lock walls controlled by mechanism for that purpose. The gates are never operated against a head of water and are opened only when the water in the chamber is level with the pool with which it communicates.

Ohio River locks are 110 feet wide and 600 feet long. Upper and lower guide walls are of the same length, which enables boats with long tows to float against them and drift into the locks.

Such, in brief outline, is the method by which the Ohio River is being converted into a canal. This project has been in course of construction for nearly 40 years. It is now three-fourths completed and the work has been carried so far that the end of the old days of "waiting for a rise" is in sight. Within a few years and with funds already provided for, the improvement of the river will be accomplished beyond the points that are frequently, or even occasionally, denied water transportation because of low stages of the river.

In the meantime nine of the tributary rivers besides the Monongahela have been canalized in the same general manner, but the advantages of the undertaking cannot be fully realized till the work of improving the main artery of the system is fully completed.

Top—Dam, lock and power house of Number 12, in the Ohio River at Wheeling, W. Va., remarkable as showing the entire plant in one view which, incidentally, is a picturesque stretch of water. The view is taken upstream.

Left—Wicket of a "movable" dam, raised and lowered.

Right—The "maneuvering boat" and crew raising the wickets of a dam.

Some Famous Timepieces

Queens of Old Possessed Weird Timepieces

THE fragile watch of dainty pattern and design, which today is a favorite among women, is in striking contrast to some of the watches which were famous several centuries ago.

Many of these were of enormous size and of the most ornate design.

Mary Queen of Scots was the possessor of a death's-head watch, which was of silver gilt and most elaborately ornamented. The forehead of the skull bore the symbols of death, the scythe and hourglass placed between a palace and a cottage to show the impartiality of the grim destroyer. At the back of the skull was Time, destroying all things, and at the top of the head, scenes of the Garden of Eden and the crucifixion. The watch was opened by reversing the skull, placing the upper part of it in the hollow of the hand and lifting the jaw by the hinge, this part being enriched by engraved representations of the Holy Trinity, angels, and shepherds with their flocks. The works of the watch formed the brains of the skull, and were within a silver envelope which acted as a musically-toned bell, while the dial plate was in the place of the palate. The curious work of art was made at Blois and, at her death, was bequeathed by Mary Queen of Scots to her maid of honor, Mary Seton in 1587. It afterward came into the possession of Sir John Dick Lander.

Another skull watch, which once belonged to Mary Queen of Scots, by its inscription and date, 1560, shows that Francis II of France presented it to his young wife many years before watches were supposed to have been brought to England from Germany.

Queen Mary was, evidently, a collector of watches of unique design. She is said to have possessed one in a case of crystal, shaped like a coffin, and another made at Rouen, in which a thread of catgut supplied the place of a chain.

Some of the early watches were so small as to be set in the head of walking-sticks, the clasp of bracelets, or in pendants, and there is a record of a striking watch, which was mounted in a ring, in the year, 1542.

At the Strawberry Hill sale Queen Victoria purchased a little clock of brass-gilt which had been presented to Anne Boleyn by Henry VIII upon their marriage in 1532. It is richly chased and engraved and is still at Windsor Castle.

The clock placed in one of the towers at the palace at Hampton Court in 1551 is said to be the oldest English-made clock extant. When in action it shows the motions of several of the planets. The dial and several of the wheels attached to the back of the dial still remain.

A Lost Art

By KATHERINE HAVILAND TAYLOR

BACK in the days when housekeepers made their own soap and their men were not ashamed to wear patched clothing, there was often quoted an old adage which runs thus:

"No one living in a rented house should own a boughten carpet." This testified to the fact that any expense which was out of proportion or beyond the easy reach of one's income was in bad taste. In those days, a due regard was given to suitability. Does it not stand forth in the above? And in those days of simplicity—which is no more than the frank accepting and speaking of truth—in those days was beautifully alive The Lost Art.

Today is splendid. I have no wish to return to the time of no washing machines and the broom-whirling-dust cleaning days, but I do wish that someone who counted enough to be imitated would discover simplicity—or the lost art of telling the truth. Telling the truth financially, I mean; so that many of us, who now spend because our neighbors spend, would look at our incomes—see them not as related to someone's else income, but as they are related to and make our circumstances—and then be brave enough to save when we should, and to tell the truth about where we stand, through our grocer, our stationer, our dress and our little trimmings.

Not long before Christmas an embryo author wrote me that she was so poor she couldn't afford a new suit; she described at length the threadbare condition of her cuffs—to the extent of some pages, if I recall correctly—and asserted that she could afford but one movie a week. Well, one would be enough for me, but let that go! What I am getting at is the fact that among the many pretty cards that came to me, was one from her, engraved, hand-colored, gorgeous.

How foolish is today!

The daughter of the town's most wealthy citizen and the daughter of the hard-struggling money-pinched, use the same sort of writing paper. One rarely sees a printed invitation to even a little party. It is thought bad form. Why? Because you can pay for it without wincing?

The sort of motors that the wealthy use, are used by the people who worry about paying for gas.

I went to supper the other night with a woman who writes—went to her own apartment—she is well known so I'll call her Mary, which is not her name. "You know," she said, as she opened a bottle of maraschino cherries, "that I use bottles of these things every month, and the cost of good, firm ones is ghastly!"

"Then why do you use them, Mary?" I asked.

"Well," she answered a little shamefacedly, "a grape fruit or salad is so bare without them, and—every one expects them!"

How many times have you heard silly women speak this way?

"The Joneses have one of those cabinet phonographs. I wish we had one—ours looks so *crude* after theirs—"

(The Joneses have three thousand more a year, but that makes no difference.)

"The (cold or hot) weather almost kills me, I *have* to get away. I thought I'd try that place where Mrs. Muchcash goes—"

(Relative incomes, five thousand, twenty thousand, but don't acknowledge that Mrs. Muchcash can afford anything *you* can't! No, *don't!*)

"I wanted the *best* for baby—"

(Pride, made lovely by love, or pride that was made by watching the wife of a young millionaire and what she bought for her baby?)

I don't advocate a whine, I detest those weak-wailing folk who talk of what they can't afford. I do advocate knowing what you can't afford and resisting it without words; resisting it not as an imposition, but as an *obligation.*

This Christmas, for the first time in my experience, I found five printed Christmas cards among those that I received. They were from two writers of decided distinction, and three editors of wide renown.

I was much relieved because mine had been printed, and this departure into the truth about my circumstances, had taken courage.

What would happen if the old world turned over a new leaf and decided to rejuvenate a Lost Art? And if people generally (women I am afraid especially need this), if people generally looked at their incomes as *their* incomes, and in no way related to Mrs. Jones's income, and decided to use their incomes as they should be used, and not misuse them?

I think there would be fewer widows left without adequate insurance.

I think there would be fewer hurried, city-dragged looking men.

I think there would be less discontent on the faces of many women.

I think that some of the daughters of moderate circumstances, who lunch in town at smart restaurants as do the daughters of Midas, might stay home and learn to cook.

Why not, for an experiment, look not at what your neighbor's income provides, but what your own should, and should NOT, provide?

Why not measure it, not in phonographs, sport clothes, over-draperies—heaven knows not what—but measure it against the discontent that will come from worry, when you overstep the limits of what money will and will not do?

Why not let your living echo your circumstances? Why not wash and hang out your finer clothes, if you ought to, even though no one on your block does?

Why not try the truth about finances for a while?

The Public Defender—A New Bulwark

Concluded from page 3

co-operation between the public defender and the prosecutor.

The introduction of the public defender in Los Angeles has practically eliminated the shyster lawyer who made his devious living by preying upon the ignorant and unfortunate. To foreigners who have an imperfect knowledge of our language and customs the office has been an especial boon. Instead of being forced to rely upon crooked interpreters, often in league with an attorney to defraud him, he is given the services of a reliable interpreter hired by the public defender. Many a man has been railroaded into the penitentiary because of inability to tell the facts in intelligible English and not having money to hire a competent interpreter.

Another thing that the public defender's office has accomplished and which alone should justify its establishment is the number of youths saved from the penitentiary and started upon the right road. Here is one incident of many hundreds.

A youth was arrested at San Pedro, the harbor town of Los Angeles, for stealing a boiled ham and a sweater. He refused the services of an attorney and pleaded guilty. The judge was not satisfied. He asked the public defender to have a talk with the young man before he was sentenced. At first he refused to tell Aggeler about his parents or home. But Aggeler persisted. Finally he gave the name of his father in St. Louis but pleaded with Aggeler not to let his mother know of his predicament. Aggeler wrote East and received telegrams in return stating that his father had been searching for the boy for three years. He had left home when 16 and had drifted from one city to another, obtaining odd jobs. He had gone to San Pedro intending to ship on a boat but as he had to wait several days before a ship came in he bunked with a beach comber. When their money ran out the old man persuaded him to steal the boiled ham from a butcher shop where he also picked up an old sweater.

It was his first offense and justified in a measure by hunger. Public Defender Aggeler presented the case to the court who released the youth on probation. His father sent him a ticket to come home, as well as money to pay for the ham. He met the boy at the depot, bought him a new suit of clothes and to this day the boy's mother does not know of her son's narrow escape from being a convict. The boy is now married and doing very well.

This is only one of many such incidents related by Mr. Aggeler. Surely it pays any community to make useful citizens of such boys, who are not criminals at heart but often the victims of circumstance.

But it is not in criminal cases alone that the public defender's office has justified its existence. The public defender has recovered as much as $25,000 in a single year in small claims for working men. The civil department of the office is in many ways as important to the cause of justice as the criminal one.

In the report for 1919-1920 the public defender is reported to have handled 6,837 applications.

Advice was given in 4,582 cases and 1,132 cases were turned over to other attorneys as the applicants were financially able to prosecute the suits themselves.

In both criminal and civil cases the applicant is required to swear to an affidavit setting forth that he is financially unable to fight the case. The public defender then investigates if he suspects that he is being imposed upon. Such cases are rare, however, as most of the applicants are sincere in their desire to tell the truth.

The claims accepted for adjustment were divided in 1919-1920 as follows: Labor claims, 537; detention of personal property, 160; injury to personal property, 73; illegal attachments and garnishments, 55; miscellaneous cases, 296.

Suits filed and won numbered 39, suits filed and lost, two and cases pending, four.

The money paid into the office without suit amounted to $3,870.63; money and chattels recovered without suit out of the office amounted to $7,902.96. These may not seem to be very imposing totals until it is remembered that all these sums ranged under $100 each and represented a small fortune to the poor litigants.

The labor claims are mainly those of men who are discharged through some disagreements with their employers. The employer may owe them a matter of $5 or $10 and refuse to pay. Under the law as followed in most states, the laborer has no recourse. It would cost him more to collect than the amount due him. In Los Angeles it costs him nothing. He states his case to the public defender or one of his deputies. A letter is sent to his employer asking him to come to the office and explain why he didn't pay his employe. In most cases the employer does not show up. He sends a check. If he feels, however, that he was justified in withholding the money in dispute he explains his side of the case and the public defender acts as arbiter. It is practically impossible for an employer in Los Angeles County to evade payment of a just claim, no matter how small it may be, since the establishment of the public defender's office.

The arbitrary seizing of a poor man or woman's personal belongings for non-payment of board or rent has also become almost an extinct habit in Los Angeles, because landlords know that they will have the public defender's office to reckon with if they exceed their legal rights.

Servants unjustly deprived of their wages for alleged breakage are protected by the public defender and numerous society matrons have been summoned to explain why a certain sum was deducted from Tillie's wages. When they find that the girl has found a defender they usually settle the amount in dispute rather than stand suit and the consequent notoriety. No matter how small one may be, he or she dislikes to have the fact advertised.

Illegal garnishments, instituted by loan sharks and others of their ilk, and illegal attachments, much more numerous than one would imagine, come under the scrutiny of the public defender's office. Many an unfortunate, whose wages have been garnisheed to pay the usurious interest of a loan shark and whose furniture has been taken from his home to satisfy some rapacious creditor, has been rescued by the public defender.

A glance along the long corridor that faces the public defender's offices and those of his deputies gives an insight into the character of the business transacted within. Two chairs are occupied by cripples, men past the prime of life who evidently have a hard time keeping the wolf from the door. In the next chair sits a buxom colored woman; then an angular little woman with the mincing manner of an old maid. Next to her is a well-dressed woman past middle age who looks like a housekeeper or mayhap a chambermaid. Sitting beyond her is a flashily-dressed woman of thirty. A little old lady with the roughened hands of a scrub woman is next and then two laborers, a white man and a Mexican.

How long would the exponents of Bolshevism continue to obtain converts in the cities of this land if the laboring class knew that the state was as ready to defend them as it was to prosecute? The inequality of the law is one of the agitator's strongest talking points. Let his auditors realize that poverty would not defraud them of their rights in the courts and half his thunder would be stolen.

"Cutting Up Old Circus Money"

Concluded from page 11

tacular fashion. I always wound things up that way; it was the circus coming out of me, I guess.

"One night shortly after that, we were riding to Waco. We were within three or four miles of the town before daylight when we thought we would take a nap. We carried horsehair lariats and little stakes that we stuck in the ground to picket our ponies while we slept. We also carried Mexican blankets that we put under the saddles to ease our ponies' backs. That gave us a blanket apiece if we wanted them when it rained.

"This night I took the blanket off my pony, folded it up nicely, and laid it on the grass; put my pony out with the lariat, and lay down to sleep. About sun-up I woke up when the rest of the boys did, picked up my blanket, and started to fold it, when I looked down at my feet. There lay two of the biggest bull snakes I ever saw. I had been lying on them all night, and I didn't know whether they crawled there while I was asleep, or whether I laid the blanket down on them before I went to sleep.

"When I saw the snakes I was paralyzed. For a minute I stood still, and then I commenced to yell and jump around like I was crazy. There was nothing there to kill the snakes with, and they crawled away. That settled the pony riding for good. And to this day, as old as I am, I shiver every time I think of those snakes, and as long as I ran the show I never did go close to any of the snake charmers; nor did I ever look at any of the thousands of snakes that I've owned.

"And a curious thing, too, about being scared by snakes, I got another terrible snake scare in Texas years after that time. The whole show got it, too. I had a snake man by the name of Millwood with the show who had been with me for years. I hired him at Cairo, Illinois. He had a cage built like a room, and he claimed to have one thousand reptiles in it, of every variety on the American continent. Well, he had this cage on the street in Cairo one year when we showed there, and it was such an attraction that I heard about it, and sent my brother Gil down to look it over. When he came back and reported to me what it was, I hired the man. He conducted what we call the 'uptown show,' an attraction that catches the crowds before parade on the street.

"Millwood would sit among the snakes, fondling them, and appeared to be infatuated with them. There was nothing he loved so well as a snake, and he never was happy without a bunch of them about him. He carried snakes in every pocket, and they always were of the deadly kind. And he never took the bother to remove their poison bags. But I never let him come near me; I told him I'd kill him if he didn't keep as far away from me as he could when he saw me coming.

"One season, when we were returning from San Francisco to Florida, whenever the circus trains stopped in Texas for water, or to pass other trains, everybody jumped off and commenced to hunt snake holes.

"'Hey, Millwood, here's another snake hole,' whoever found one would yell.

"Then Millwood would come running, and shove his hand down into the hole and pull out the snake. By that time, somebody else would find a snake hole, and Millwood pulled out snakes until the train started. He put the snakes in a carpet bag.

"One Sunday afternoon he had the bag filled with snakes when the train pulled out. When he got on the sleeper he hung the bag on a hook. The berths were stationary, and the boys were lying in them, smoking and talking and singing, when some fellow happened to look up. The carpet bag was open, and snakes were falling out of it as fast as they could.

"Well, my private car was next to this car, and I heard the yelling. I thought something awful had happened, and ran to the door. Just as I got there the car door was pouring out men like they were rats scampering from a burning building. They climbed on the roof, and some of them jumped off while the train was running twenty miles an hour.

"We finally got the train stopped, and sent Millwood into the car to get his snakes. He put them in his carpet bag, but he couldn't tell whether he had all of them, because he hadn't counted them. The only way we got the thing settled was to sidetrack the car; tear everything out of it, and thoroughly search it. And I had the same thing done to my car, but they found no snakes in it. But for weeks I never entered that car, and I never went to bed, but what I cringed all over, thinking of the snakes Millwood had turned loose by his carelessness, and of the morning I saw the two bull snakes on the prairie just outside of Waco.

"Millwood, however, died a horrible death a few years after that time in Fayetteville, Arkansas. Across the street from his uptown show a saloon keeper had in a box the biggest rattlesnake that had been captured in that vicinity. Millwood went in to see it, ran his hand down into the box, and pulled the snake out. He finally bought it for a dollar.

"When he got a little leisure time he brought the snake out, and began caressing it; rubbing his hand over its head, and holding it to his bosom. Then he bent over to kiss the snake, and it bit him.

"The liquor he usually drank to counteract the poison did not avail, and he died in the most intense agony."

A 300-Year-Old Flour Mill in Japan

(C) Gilliams Service

The miller and his family are shown in the foreground while in the background is to be noted the picturesque old water wheel that turns the machinery which for three centuries has ground the flour for neighboring farmers.

Co-operation Among Our Farmers Is at Hand

By F. B. NICHOLS

NATIONAL co-operation among American farmers is at hand. With the approval in Chicago the first week in April by delegates from the surplus grain-producing states of the grain-marketing plan prepared by the Committee of Seventeen, the producers are ready to support a national commodity organization which has been organized on business principles with full consideration of things as they are. Other lines of farming will follow—committees are now at work on marketing plans for live stock, dairy products and fruit.

Will farmers support these plans? Do they wish to have these big marketing organizations controlled by the producers and returning the profits on a patronage dividend basis? Will they give these organizations the loyal support necessary for success? Will they stand hitched? I believe that the answer to all of these questions is, "Yes." We shall find out very soon, however, by the way they get behind the grain-marketing movement.

There is every indication that the farmers of America have learned a good deal about business principles in the last three years, and especially in the last six months. The necessity for co-operative effort never before was so well understood. This is evident in every meeting of farmers, and in their conversation as they talk over the boundary fence, or meet one another on the road or at town. I believe that agriculture can never be on the right plane with other lines of American business until a national united effort is made. This means merely the application of the ordinary business principles which other lines of American effort have found so profitable.

Anyhow the whole thing is now placed up to the producers. Will they "jine" the movement? Unless they do, and right promptly so far as the grain growers are concerned, it will be evidence that the day for a united effort is not at hand, and co-operation will be put back a generation, or many years at least. The day of talk has passed. The epoch of organization is here. The future of American agriculture will be decided by the action taken.

An interesting and hopeful thing in this connection is that there is nothing extreme or radical in the methods which have been given serious consideration. There is nothing in the plan of the Committee of Seventeen, for example, to "scrap" any of the property concerned with grain marketing as organized today. The farmer has always shown a great respect for property rights, and this is true with the new national co-operative movements which are being fathered by the American Farm Bureau Federation. The only idea seems to be to apply ordinary business methods as now understood to the organization of national commodity marketing organizations, along somewhat the same lines as have proved so successful with the California Fruit Growers' Association in the sale of oranges and other citrous fruits grown in that state. Furthermore, the proposed change in marketing methods will be so gradual, though none the less sure if successful, that there should be little or no hardship on the men engaged in the business—they will have the opportunity either to work with the new system, or to drop out and engage in other lines of business.

The organization plan of the Committee of Seventeen as worked out for the grain growers is simple. The National Sales Agency, chartered under the laws of Delaware as the United States Grain Growers, Inc., will be managed by 21 farmer directors elected in a fair way from the surplus grain states on a basis of membership in the organization. These directors will have absolute control; they will elect their own officers, and hire the experts to handle the grain through the markets. The producers will be organized into local units at the local co-operative elevators, or into local grain growers' associations if there is no local co-operative elevator. Membership will run from the individual growers to the local association and also to the National Sales Agency. It is probable that all of the other commodity organizations that may be organized in other lines will agree with this one in having a national board of directors elected by farmers, which will have absolute control, and also a local association organized on co-operative principles.

Naturally a vital link in the organization is the financial arrangements, but this is not so serious as might be at first thought. It is likely that many of the city banks and much of the intrenched capital connected in any way with marketing as it is now conducted will be against the plan, but the producers remain to be heard from. The membership fee in the United States Grain Growers, Inc., will be $10. It is estimated that it will cost not more than $3 to the man to get the plan started, so this will leave $7 for the preliminary operating expenses of the central body. It is expected that perhaps 100 million dollars of working capital will be necessary, and this sounds like a large amount, but when one considers that there are perhaps four million farmers who will join this plan, and that it can be spread out over the crowd, it doesn't appear so large. Perhaps it will not be possible to get every farmer to put $25 into the capital stock, but it does seem likely that it will be possible to get one farmer in four to put $100 into the company, on which dividends of perhaps six to eight per cent would be paid before a patronage dividend was returned to the sellers. This money invested in the capital stock should be absolutely safe, and there is every probability that it will be subscribed as rapidly as needed by the growth of the organization work.

The experience of farmers in California and other states of the Far West has shown that farmers will support plans of this kind, and it is believed that they will do it now on a national scale.

Agriculture is the only great business which is not organized today, and the producers will never be on a basis of equality in dealing with competitors until a united effort is put forth. The road to market must be made straighter, and it can be so made with profit to both the producer and the consumer. There is no disposition on the part of the farmers to fix prices, restrict production, or "monkey" with sound business principles. In this lies the hope of the movement. There is nothing extreme, nothing fanciful in what the growers hope to do. They merely wish to apply the demonstrated principles of business success. They are asking for no favorable legislation or government aid. They merely wish to use the business principles which have been worked out in America, and apply these to national co-operative effort.

There is no question but what this will help to solve some of the alarming economic questions with which farmers are confronted. Agriculture is not in a happy condition today, and the fine mess which it is in is having a serious affect on other lines of business. The farmer is not in a buying frame of mind. He is of the general opinion that he has been "done" most thoroughly, and this naturally has produced a most conservative frame of mind so far as expenditures are concerned. The inevitable result is the number of city industries which are running on part time or else closed down entirely. The farmer is willing to take his chances with other lines of business if he has an equal opportunity, but he believes that in his unorganized condition today he is at the mercy of organized manipulation of his markets at every point, and there is suspicion that he will always be the first to be "deflated" until he gets on a plane of organization equal to all other lines.

If he can get the national commodity organizations which he wants and believes in, it will have an important psychological effect in making him more contented, and the farm market for the various lines of essentials manufactured in the city assured of more stable conditions. Furthermore, it should be of value to the consumer in directly lowering prices in many lines. The farmer is naturally interested in a large consumption, and is thoroughly aware that reasonable prices are necessary if the maximum demand is made possible. The record of the California Fruit Growers' Association, the most successful agricultural co-operative enterprise in America, has shown that it has a most profound respect for the consumer. It has made possible a national distribution of citrous fruits on a scale and at a reasonable price which was never possible in the old days.

And so it will work out in a national way with grain, live stock, fruit, dairying and other lines of co-operation into which the farmers go. The day of national agricultural co-operation is here.

The World Forgetting By the World Forgot

Sequestered Life of the Monks of Old Santa Barbara in California, Far From the Madding Crowd.

RECKLESS of the tumult and the shouting of wars and near-wars, as of the rise and fall of empires, kingdoms and republics, the monks of the Santa Barbara Mission in Southern California lead a serene and sequestered life. True, the ubiquitous tourist is likely to include this famous old Spanish mission in his itinerary, but there is a section of it that knows not the tread of his foot nor the sound of his raucous voice. This is the "Forbidden Garden" shown in the accompanying photograph. Rare indeed is the privilege of entering within its borders and one granted only to the occasional pilgrim or artist trusted to venerate its quiet religious atmosphere by observing complete silence.

Here today, as during the hundreds of years that have elapsed since the days of the "Conquistadores" and the good padres who followed in their train, the monks walk in pensive meditation or read their "offices," the while they are not lovingly tending their flowers, which in this California wonderland bloom all the year around.

All about the place there is the ripe mellowness of age blended paradoxically with that effulgent energy of youth which is characteristic of California. The soil is rich with fatness. Responding to the sun's warm caress, it yields abundantly of fruits and flowers whose varied color and fragrance lend the land its great charm. And just because of the wine-like stimulus of its air, the restfulness of this sylvan retreat is the more alluring.

It is difficult to imagine the picture as one taken in any spot of hustling and bustling modern America. The domed belfry, the tiled roof surmounting walls of whitish gray adobe, and the vivid greens of the eucalyptus and pepper tree foliage standing out in strong relief in the brilliant sunshine, as well as the luxuriant colors of the flowering shrubs, are all reminiscent rather of some remote corner of medieval Italy or Spain. This suggestion of olden times and distant scenes is heightened, of course, by the figure of the good monk in his brown Franciscan robe and sandals.

And, indeed, it is nothing less than a little bit of Andalusia the olden that is thus conserved on our continent for the contemplation of twentieth century Americans. Its picturesqueness appeals to the esthetic sense, while its cloistered calm lifts the soul out of the clash and strife of transitory things.

(C) Gilliams Service

THE WORLD IS KEPT WITHOUT THE WALLS.

URBANA ILL

Briefly Told

A Louisiana Negro convicted of murder in the first degree, will serve a life imprisonment sentence instead of hanging. The sheriff forgot the date of the execution and the board of pardons contended that the Negro's life had been placed in jeopardy once and commuted the sentence to life imprisonment.

Desiring to improve the health, and the life chances of children, Portland, Oregon, is planning to observe a "well babies' week."

Six skeletons, believed to be those of white soldiers who lost their lives in combat with the Indians during the early wars in the Oregon country, were unearthed by excavation crews working on the Columbia River highway near the Deschutes River. Army accouterments were found in the graves.

Gold assaying ninety-one dollars to the ton has been discovered in the Gatineau district, Quebec, about fifty miles north of Ottawa.

Potter's field in New York City has reached its capacity. There are but two more plots to be filled.

A chair made from a rib of one of the first American warships, the Revenge, is to be presented to President Harding by fellow publishers. The Revenge was sunk in Lake Champlain by the British in 1776. In 1909 it was raised from the lake bed and the hull is now at Ticonderoga.

During the last year postal robberies totaled more than six million dollars of which three and one-half million has been recovered.

Believing that the heavier-than-air machines are capable of performing any feats formerly accomplished by the dirigibles, Great Britain has relegated her enormous fleet of dirigibles to the junk heaps, planning to replace them with airplanes.

Membership in a certain gun club in California costs $150,000 since a gusher was brought in on the land recently. At present, the well is yielding thirty thousand barrels of oil daily.

The United States Senate has ratified the treaty between this country and Great Britain to make desertion of children an extraditable offense between the United States and Canada.

Bending every effort toward recovery, the German Government is planning to operate again the central German coal mines near Halle. These mines have not been worked for more than a century.

Sixty-five thousand girls disappeared last year in the United States.

The famous railroad car in which the armistice was signed has been transported to the army museum in the Invalides. The table, chairs and cabinet are arranged in it exactly as they stood on the morning of November 11, 1918.

The yak, or woolly ox, of Tibet, is to be raised in Alaska and the Yukon country. The yak has been domesticated for centuries and its haunts are the snow-covered highlands of Tibet, thousands of feet above the sea. The animal eats a coarse wiry grass and compares favorably with range cattle in weight. The wool and hide are also valuable.

A naturalist pleads with women to cease wearing furs during the summer at least, because fur-bearing animals are being destroyed so rapidly that in thirty years there will be practically none left.

Brazilian railroads are burning wood for fuel. A modern locomotive fitted with a water-tube and fire brick arch with a correct proportion of firebox and boiler burns wood with no serious waste of the fuel.

Boston scientists declare the "hot dog" the most nourishing of all sandwiches. The "Frankfurter" sandwich, selling for a nickel and scorned by many, contains two hundred and fifty calories, while the higher priced corned beef, tongue, cheese and ham sandwiches yield below two hundred calories.

The Secretary of the Navy has authorized the wearing, on stated occasions, of the frock coat, full-dress trousers, cocked hat, dress sword and sword belt, and epaulets.

Because he criticized newspapers which display "sensational events," a Denver pastor published an "ideal newspaper" for one day. The publishers of the Denver *Post* invited the pastor to become editor-in-chief for May 5. On that date the minister dictated how the news should be displayed, determined news values, directed assignment of reporters and had complete control.

An unusual occurrence has been reported from an Ohio farm where an ewe gave birth to five perfectly formed lambs, all of which are living and healthy.

A patient at a Vermont sanitarium is an anatomical curiosity. All his internal organs are "on the wrong side." X-ray pictures revealed the fact that the stomach is misplaced, the liver on the left side, the heart on the right side and the appendix on the left. He is recovering from tuberculosis.

The Waseda University of Japan has a baseball team which plans to play American colleges across the country from the Pacific to the Atlantic, meeting Yale and Harvard this summer. They have planned to postpone the Pacific Coast games until the close of the tour, so as to play the middle western and eastern colleges before they close.

COURAGE THAT DOES NOT FALTER!

And a Magazine Devoted to YOUR Interests!

The American people are paying tribute to the one magazine in this country which has courage to print the truth—which does not fear the powerful interests that exercise such a tremendous influence on the newspapers and periodicals of the United States. Not only are we continuing the discussion which has aroused the entire country to the conditions which have been created by a highly-organized minority, but our plans call for the publication of further truth-telling, informative articles on subjects which for the most part heretofore have been denied the public.

Why Not Child Labor Laws for the Home?

By UTHAI VINCENT WILCOX

HE WAS but fifteen years of age, but he could tell of his experiences along the road from New Orleans to Tiajuana. He was equally at home in camps and on the brake-rods of freight trains.

It was in San Jose, California, that he was "picked up" by the probation officers. After giving his name as Smith he remarked that his specialty was plain and fancy hoboing and loafing; with eating a fine art.

"I got him a job as an apprentice for a trade," said the probation officer. "He was to show up at a certain time, within thirty minutes, to go to work. That was the last we saw of him. That boy will never work. We have since heard from him in other towns."

The life history of that lad along with many others proved to the satisfaction of the probation officers that youths never voluntarily work at fifteen if they have not learned the value of work at ten. It is worth real dollars to have to learn—yes, learn—the value of work. It is worth dollars to the boy and the girl, if not to the parents.

It is easy to emphasize the value of play, and abundant play is needed and should be provided. But all work and no play, you know—.

Let Johnny, Alice, Mabel and Merwin learn *how* to work and that it is necessary that they should work. In a western city, recently, two fine, stalwart lads were arrested on a warrant sworn to by a local grocer. The charge was that of breaking into his private garage and taking the touring car to a near-by town and toward morning bringing it back.

Investigation by friends and the juvenile court showed that the boys "wanted to do something," and, lacking wise direction, they "borrowed" the machine. They had intended no harm.

One boy's parents were wealthy, and so he never had anything to do at home. After school he was idle. All the labor about the house was paid for and so he was not expected to work. The other boy was an only son whose father was dead. His mother never demanded that her son do anything and naturally he didn't do anything.

The wise judge of the juvenile court in talking over the case clearly indicated that he would prefer to pass sentence on the parents rather than on the boys. The crime had been committed because the parents had been too busy to keep their sons busy. "You should have regular, definite work to do after school—work that will make you tired," said the judge.

If you will visit the juvenile court in your city and watch there the parents of the "delinquent" children, you will find them really distressed.

"He has been such a good boy;" "She has always been such a nice girl," they puzzle. "I can't see why they did it!" "I don't understand!" In the majority of the cases the boys and girls come from good homes, but it almost invariably develops, according to the officers, that these children of the "good homes" have had nothing to do after school or in the evenings. There have been no tasks or duties to perform; no work has been expected of them. "An idle brain makes the devil more efficient" is more than a mere adage. If it isn't a personal devil that exerts the influence, then there are any number of men and boys plus circumstances abundantly able to qualify for producing devilish results.

No young Smith, or Jones, or Morgan is going to grow into a useful citizen of this republic unless he first learns that work is one of the necessities of life. It is not the loss of the boy alone nor the loss of his labor, which many times is negligible, wherein the trouble lies; there is, however, a very real danger to the community.

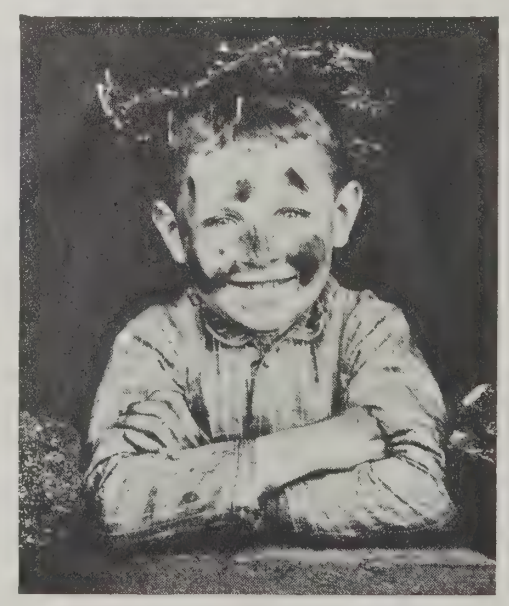
If Johnny is left to run at large and find out by chance and experience his relation to the state, the home and other institutions, there is a very real danger that Johnny will become a loose thinker, easily swayed by the unsound doctrines of the agitator—a snap judgment citizen ready to accept the half-baked theories of political revolutionists.

"It is both astonishing and startling," said an industrial investigator to a chamber of commerce, "how many grown men there are in the country who seem to be acting upon the belief that the world owes them a living and they are obligated in obtaining this living only to the extent of keeping outside of the clutches of the law."

"I'm preaching the gospel of perspiration as a saving grace for inspiration," said an old minister who was rearing a group of young men in his family. "One of the best panaceas for the ills of the country that I know is the character training that comes of the home law, 'Do something useful about the house.' I've put up a sign in my boys' room where they will see it morning and night. If necessary, I'll illuminate it with electric light.

"'The world owes me a living, but I also owe the world the fullest possible measure of honest effort in payment for that living.'"

The joy of the first fruits, be they luscious strawberries or mere potatoes! There is reward enough for many a small worker. When he grows older he will then appreciate the reward implanted in his character—the ability to carry on sustained effort.



Every child wants to do as father or mother does. Let the first toys be useful ones. A small broom and sweeper are always received joyfully and the idea of helpful effort thereby is encouraged. A set of dishes, small garden tools, these and other practical playthings promote the idea of work and its needs. They will bring growing through doing.

As soon as Alice and Algy are able to understand, simple duties should be assigned and their performance expected. It may mean a little extra effort for someone; perhaps the lowering of the closet hooks so the clothes can be hung up rather than thrown on the floor; the providing of playroom boxes instead of shelves where toys can be put away after using. It may be an initial towel in the bathroom that must be hung on a certain rod; it should be something that means regularity in the home life, and comfort for all.

A wise, gray-haired mother was visiting some friends. When she returned home she confided in her husband that "training children has greatly changed in recent years. Ellen learns her children's lessons, invents plays for them, arranges their rooms after them, picks up what they let fall, puts in order the things they have left in confusion; she does everything for her children but eat for them. Even then she worries if they do not like their food and it isn't just so!"

How will any normal boy or girl develop imagination, invention and creative ability if he has nothing that he must do for himself — no regular work that is daily expected of him. Where will he get his training of the need of continuous effort and the value of perseverance?

Give the boys and the girls some work to do, particularly during the vacation time. Let the work be serious and regular work, chosen not only because it is good work but because of its educational value. It probably will do more for the future welfare of the child than the ability correctly to parse a sentence or to "bound" the republic of Ecuador.

What is a little dirt in a boy's life? Getting coal in and looking after the chores may blacken his hands and face but later it will help to keep his character white.

Some educators are even now advocating that the school supply the lack of the discipline of the homes and make it a part of the duty of Joseph and Josie to do profitable work. "Child labor" in the sense of grinding toil is not needed nor wanted, but there should be organized effort along some regular line. It is just this lack in some homes that causes the legislators to pass more paternal laws to supply the lack of paternal authority at home.

Home chores and homely tasks are not to be despised. There are dishes to wash, wood to bring in, the lawn to mow, the rooms to dust, the stockings to mend. These are easy, yet are of educational value because of their character-building discipline.

A generation ago the boys and girls did these and much harder things as a matter of course. Is there any reason why we should discard such customs now?

Over-indulgence cultivates a disregard for the feelings of others. In some boys this may easily mean youthful banditry, and if not that then later unscrupulous dealings in business. In girls it means selfishness, ingrowing dispositions, the craving for excitement and an unnatural outlook on life. In localities where juvenile clubs for raising corn or potatoes exist, the boy should be encouraged to compete. Here is an excellent type of competition that spurs the boy to do his best. And he will learn all possible of the most efficient way to do his work. Most of the labor comes after school; it is outdoors, and varied. Many boys have succeeded in raising prize specimens superior to anything accomplished by adults. Let a boy get thoroughly interested and he will be painstaking in detail in a manner that will astonish his parents and neighbors.

Girls often enter these prize-winning contests with success. There are cooking classes that offer prizes and teach the value of sustained effort. This is only work camouflaged. Many a county fair has its tables bearing the healthful and appetizing and artistic results of the girl's cooking, baking and sewing, with ribbons gaily fluttering to mark the honorable rewards.

Such training develops independence, self-reliance, and the teaching of the fundamental truth that you must work—really work—for what you want in this world, Socialists, Bolsheviks and Communists to the contrary.

Then, too, there are always emergencies when the early training of having to do simple tasks well and at regular intervals is worth a jar of gold dust. A girl recently wrote a letter to her chum. She had gone to the mountains with her mother to help her find health and rest. Sickness found them away from home conveniences and among people unused to the "necessities" of civilization. Her letter said:

"Mother has been sick, and I'm not well and so the keeping of the little house here in the mountains is quite a task, but thanks to my early training I am accomplishing it quite well. One evening I had company for supper. It was no joke to entertain four persons, but I enjoyed it, though I was in the kitchen until ten o'clock. Oh, yes, I made a dress, slip, and hood for a baby, also giving it a bib and bootees, because its mother could not make anything for it in time to go on a visit."

Nothing but an early knowledge of work and service could teach any girl or woman to do such things well. Training of that sort does not come by any inspiration or fine frenzy, it comes through the slow process of duties performed and tasks accomplished whether the inclination is there or not.

O. H. Benson, recently of the Department of Agriculture, but now guiding the Junior Achievement League which is financed by a group of sixty wealthy men, has drawn from his own experience as well as practical observation when he lays down four rules for "growing good citizens":

First, let the child take part in the production of the business of the home.

Second, don't let your children leave home to do their first work. Show them how to work and earn at home.

Third, teach the child to love his work while he is yet a child by infusing into that work the spirit of contest, challenge and enthusiasm. This will make work seem like play.

Fourth, make the child's idle school hours and vacation periods an opportunity for the business of production. Salvage the child's idle hours and you salvage the child.

It is this program that such men as Theodore N. Vail and Horace A. Moses are backing, for they realize that in it lies the hope and future prosperity of America and the world. It is a program of work—of well-directed energy, or sustained effort toward a given goal.

At left—Laying out the flower bed. Character building can be provided for the girls through just such homely things as caring for a bed of flowers. The regular attention, which it must receive to be a success, is needed in children's lives.

At right—And bunnies! The faithful care even of rabbits teaches regularity and continuous effort. If aptitude is shown, the chap may soon add a few dollars to the family income.

Coming poultry experts! Let them begin when they are young to enter contests such as these A bright-eyed lassie and a sturdy lad will soon know more about the practical side of the chicken business after working at it awhile around home than most adults. Just try it and see for yourself.

Above—Holiday time! If the poultry business has been properly worked there will be dollars rolling in for a little extra training in this kind of salesmanship.

At right—String beans for dinner, raised in her own garden—and they are big ones too. Healthful appetites and sun-tanned faces will not be the only thing gained either. Besides the beans there will be the actual realization that steady work produces tangible and pleasurable results.

Edith May can practice her lesson in knitting out-of-doors. Play will be the sweeter for her if she knits or purls for a while first. She will be glad she has persevered when the task is finished—the work done.

The Accepted Time

IN REJECTING the amendment to the naval appropriations bill authorizing the President to invite Great Britain and Japan into a conference on disarmament, the House of Representatives acted under the leading of the administration. We have definitely gone on record against a policy demanded by the masses of the American people today and one of pre-eminent importance to anything like a "return to normalcy" in this country, as in Europe.

True, both President Harding and Mr. Mondell, the Republican floor leader, failed to meet the issue directly. The first declared that with the world's atmosphere filled with war disturbance the time was "not propitious" to take up disarmament, while Mr. Mondell explained that the matter was only postponed to a "more opportune" time.

The House amendment did not call for disarmament by the United States "first," that is, before Great Britain or Japan should disarm. It simply called for the convening of representatives of the three great naval powers to talk the matter over and see if some plan could not be arranged by mutual agreement for a let-up in the present calamitous competitive naval building programs.

Are we already so possessed by militarism that we are afraid even to suggest a calm reasoning together of the nations on a problem of such paramount importance?

Perhaps the President would have the people believe that he looks forward to a good time coming which will be propitious for disarmament. What time could be more propitious than the present for a bold American initiative in the right direction? Largely as a result of the continued piling up of our already intolerable tax burdens, some five millions of men are out of work today. Factories are idle and thousands of business concerns the country over are struggling desperately to avoid going over the edge of bankruptcy. Strikes and industrial chaos are threatened at every turn. Does the President realize that an anti-disarmament policy shuts off the last ray of hope of speedy emergence from these conditions through such a lightening of the tax burden involved in annual national government expenditures of from five to six billions of dollars, of which nearly 93 per cent goes for past wars and for wars that may never come?

War clouds in Europe, Mr. Harding apparently would have us understand, are his sufficient reasons for pigeon-holing any suggestion looking to a conference on disarmament. These very conditions proclaim the present to be the right psychological time for a check to the war spirit. Is the President so befuddled by the "arguments" of war profiteers and armament contractors, floaters of bond issues, professional militarists, and the fishers in troubled waters generally that he cannot realize the fact that to him is now given the high power and privilege of sounding the clear trumpet-call that would disperse all these clouds and inspire the world with new and brighter hope? Can anything be more certain than that war-exhausted and debt-burdened Europe would gladly welcome a statesmanlike lead from the United States in the present world crisis?

Now is the accepted time. Speak up, Mr. President!

The Trouble in Silesia

AGAIN the Allies are contemptuously defied by a freebooter of a nation which its armies fought to save and strengthen. Korfanty follows the example of the swashbuckler D'Annunzio. Acting ostensibly against the authority of the constitutional government of the Polish Republic, this Polish brigand has marched on Upper Silesia at the head of an armed band with the avowed object of seizing that province for Poland, as D'Annunzio seized Fiume for Italy.

What are the forces behind Korfanty? Are they the same as those that backed the Jew, D'Annunzio? Korfanty's desperate invasion of Upper Silesia may lack some of the elements of the picturesque and the romantic that flavored the "poet-warrior's" adventure. But it resembles that event in its utterly contemptuous flouting of solemn national agreements, and in its piratical disdain for even a color of decent regard for the opinion of mankind. His attitude is that which the Bolshevists have exemplified in Russia in so transcendent a degree.

In the recent plebiscite a majority of all the voters of the province declared for remaining under the German flag. But, under the terms of the Treaty of Versailles, the final decision remains with the supreme council, which, at the moment of Korfanty's filibustering raid, had under consideration a settlement that would, as a matter of fairness, take into account the preferences expressed by local districts along the lines of proportional representation allotting only those preponderantly German to Germany. Without waiting for the announcement of this decision, and probably roused to anger by the German suggestion that their efforts to pay reparations should not be crippled by a further deprivation of raw materials needed in their industries, Korfanty, who was formerly plebiscite commissioner for the district, ruthlessly betrays the confidence reposed in him by the Allies and resorts to armed invasion and terrorism.

Coming just at the most critical moment of the reparations negotiations, this Korfanty raid further complicates the entire European situation in such a way that the world is menaced with a renewal of all the horrors of the World War on an intensified scale. Premier Briand has notified Berlin that France would regard the dispatch of German troops into Upper Silesia as a violation of the Versailles Treaty. France has her eye on the rich coal lands in the districts that voted German and prefers to have them Polish rather than German, having recently concluded a treaty with Poland that constitutes a close military and economic alliance between the two countries.

The Allied forces in the plebiscite area proved totally inadequate to repel the invader. As far as the French command is concerned, it is doubtful if they even desired to repel him. With or without Allied aid, Germany could, if permitted, easily have settled his hash. What is immensely suggestive to Americans is the vivid resurgence of European imperialism in the whole incident and the callous and cavalier dismissal of every consideration save that of—coal!

In the nick of time, the United States resumes her seat in the supreme council of the Allies in the person of George Harvey, Mr. Harding's Ambassador to England. It is an irony of fate that a man chiefly known for his vitriolic abuse of Wilson and the Wilson ideals should now have the determining vote in consigning to the scrap-heap the League of Nations and so dashing the hopes of the peoples of Europe and America that it might be made over into an effective instrument for the maintenance of world peace.

Stop and Think!

IN WORDS whose wisdom is proved by their vitality, old Marcus Aurelius says: "Give thyself time to learn something new and good each day, and cease to be whirled around." Plainly, human nature remains pretty much the same down through the ages. Yet it is likely that in this our day no counsel is more to the point of human need than this of the old Roman.

The only life worthy of the name is that which proves itself in growth. Man, like every other form of life, must go forward to larger and better expression, or fall backward into stagnation and death. There is no middle course. The tree is known by its fruits. Any of us may this hour apply the simple test that determines whether we are really living or dying. It is the test of growth; the test of growth in production.

The trouble is that our age is prone to mistake motion for progress. Whirling rapidly like a squirrel in a cage, it flatters itself that it is doing something. Or what is worse, perhaps, it lacks even desire for a definite goal. Like the child on a merry-go-round, it seeks movement rather than destination. There is enough lost motion in the world every day to run a thousand factories for a year. We fail to achieve that concentration so absolutely essential to the "learning of something new and worth while" which marks the functioning of the creative mind in discovery, invention and production, because we fail to be still and think long enough to determine direction and destination. In the dizzy whirl to which we surrender, like a dog running after an automobile, we imagine that although we do not know where we are going we are somehow "on the way." The question is, on the way to what?

Workingmen's Homes

ONE of these days we may find that we have quite as much to learn from our Latin-American neighbors as we now fondly imagine they have to learn from us. Here, for instance, is a news dispatch announcing that, in an effort to relieve the housing shortage in Rio de Janeiro, the authorities have revived an almost forgotten law dating from the days of the wise and good Dom Pedro. Under this law, the homes of all workingmen are exempt from taxation.

Such a law should interest Americans just now. It would be certain to give a decided stimulus to building. If incidentally this exemption should disarm the rent brigand, the measure would not suffer in popularity. Such an exemption would certainly be in the direction of an approach to economic justice. On this account it would greatly strengthen all the forces of law and order and stall the Bolshevists. What could be more unfair than the present system of taxing the humble cottage of the wage-earner (built out of the savings of long years of hard labor, or being paid for perhaps with heavy interest out of wages in monthly installments), at the same rate as the city palace or the lordly country seat of the millionaire?

The exemption need not necessarily involve a loss of needed public revenue. The tax might well be shifted to the mansions and pleasure-houses of the rich. No particular harm would be done if such an encouragement to thrift and a permanent settling down of the workers were accompanied by a discouragement of the wanton and flagrant luxury in which observers like Sir Philip Gibbs sees one of the greatest present dangers to American democracy. It is possible that the great end in view might be more perfectly attained by a tax absorbing for the benefit of all the people the unearned increment of land values. Still there is time-honored sanction for the wisdom of taking the half-loaf while waiting for the whole. Or must the United States of America lag behind the United States of Brazil in the adoption of practical measures for the relief of house shortage?

Stock Jobbing Versus Service

THERE is a flat contradiction between the respective statements of the railway managers and the railwaymen's unions made before the Federal Wage Labor Board in connection with the demand of the railroad officials for the abrogation of the national wage agreement. Each side has put forward "experts" who have testified on the one hand that unless a reduction in wages of from 15 to 25 per cent is allowed to go into effect, the roads will be unable to carry on, owing to the pressing need for heavy outlays for repairs and renewals. On the other hand, the men's representatives have challenged these statements of fact and furnished figures tending to show that very large economies might be effected in administrative expenses and otherwise which, without touching wage-schedules, would permit the roads to be placed in a state of efficiency and operated at a profit.

In a weekly market letter sent out by a prominent Wall Street brokerage firm, and which is being reprinted widely in the labor press, the statement is made broadly that heads of the great railway systems reflect confidence in the upward trend of railway securities, "because they know all the ins and outs of the situation." Just as soon as a wage reduction is decided on, declares this bond house, the whole railroad outlook will take on a very different aspect, because the roads are not and never have been so badly off as the people have been led to believe. It is even pointed out that "only by making the items of expenditures for maintenance appear extremely large could the expense accounts show such a decided increase as is denoted in the monthly reports."

It is of vital interest to the American people that the whole matter of our national transportation be lifted out of the mud of such slang-whanging between selfish interests. The truth should be ascertained by a competent commission free from either the corporation or the trade-union bias.

Are railway managers more concerned with the juggling of values in Wall Street than with the economical and efficient administration of the properties that have been turned back to them by the government? Are the railwaymen's unions justified in their resistance to the proposed wage reductions? These are plain questions of fact that it should not be difficult to settle. If the commission of inquiry were headed by Secretary Hoover, its findings would be very apt to command the confidence of the American people as a whole.

Certain it is that some solution of the transportation problem must be found that will make impossible anything like a repetition of the notorious playing of battledore and shuttlecock with the roads of which the Erie, the Rock Island and the New Haven road scandals are the crying historical examples.

Mr. Ford's Page

EVERY little while the old question is brought up again—"Does Education Educate?"—and we have more or less entertaining demonstrations of the ignorance of college students, the illiteracy of the reading public, numerous diverting tests of knowledge, and debates concerning the difference between wisdom and learning.

It is one of our favorite sports, this habit of getting fun out of the question of knowledge: we make fun of men who never went to college, because they did not go; and we make fun of men who went to college, because going did apparently so little for them.

There never was and probably never will be a system devised that will put brains into men's heads, and until such a system appears we must expect to find in men the same differences that have always marked them, whether with books or without them, in or out of college.

Take a group of wholly illiterate men, men who cannot read a date on the calendar, who cannot write their own names, and you will find a difference in brain power among them. Equally illiterate, one man will exhibit more native intelligence; he has brains even if he has little book knowledge; he has foresight, insight, initiative; he knows what he knows, and, therefore, possesses confidence and a sense of mastery.

Passing that group through college would probably not change the comparative brain values; one would still be brighter than the others. The average of ability might be raised, but there would be no essential enlargement of native brain power.

Just as there are some stones that will not take a polish, so there are minds that cannot be standardized so far as knowledge and the ability to use it is concerned.

An able man is a man who can do things, and his ability to do things is dependent on what he has in him, and what he has in him depends on what he started with and what he has done to increase and discipline it.

An educated man is not one whose memory is trained to carry a few dates in history, but one whose mind can accomplish things. A man who cannot think is not an educated man, however many college degrees he may have acquired. Thinking is the hardest work any one can do, which is probably the reason we have so few thinkers.

There are two extremes to be avoided; one is the attitude of contempt toward education, the other is the tragic snobbery of assuming that marching through an educational system is a sure cure for ignorance and mediocrity. One benefit that education can confer on a man is to give him an equal start with his fellows. Sometimes even that is not an advantage, but in the main and for the general run of human beings, perhaps it is. You cannot learn in any school what the world is going to do next year, but you can learn some of the things which the world has tried to do in former years, and where it failed, and why it succeeded.

If education consisted in warning the young student of some of the exploded false theories on which men have tried to build, so that he may be saved the loss of time in finding this out by bitter experience, its good would be unquestioned. One sees a great deal along this line among the amateur inventors of the day. Inventors, by the way, are not made by education, but if they have enough education to save them from puttering away over the mistakes that have been conclusively proved to be mistakes, it saves them time. There are men at work today on theories fundamentally wrong, but they do not know that other men have followed that road and have had to come back. An education which consisted of signposts indicating the failures and the fallacies of the past, doubtlessly would be very useful. If education had as its objective the putting of the student in possession of the world up-to-date, so that leaving the school he could start in step with humanity, it would be a great service. But whether this is the objective, it may be better to let educators themselves decide.

It is not education and it is not learning to be in possession of the theories of a lot of professors who do not know and never will know. Speculation is very interesting, and sometimes profitable, but it is not education. To be learned in science today is merely to be aware of a hundred theories that have not been proved. And not to know what those theories are is to be "uneducated," "ignorant," and so forth. But neither the man who knows these theories nor the man who does not know them, really *knows* anything. If knowledge of guesses is learning, then one may become learned by the simple expedient of making his own guesses, and by the same token he can dub the rest of the world "ignorant" because it does not know what his guesses are.

But the best that education can do for a man is to put him in possession of his powers, give him control of the tools with which destiny has endowed him, and teach him how to think. The college renders its best service as an intellectual gymnasium, in which mental muscle is developed and the student strengthened to do what he can.

To say, however, that mental gymnastics can only be had in college is not true, as every educator knows. A man's real education begins after he has left school, as any university graduate will tell you. True education is gained through the discipline of life.

The trouble is not with the schools altogether (though their one-sidedness in filling the field with books and leaving no place for the training of eye and ear and hand is recognized), but with the public illusion that schools can do for a young man what he must do for himself. If young men come out of college uneducated it is their own fault, and the same would be true if it were a canning factory they came out of, or a boiler shop, or anywhere else. Any place, any work offers an opportunity for education, but it is something the recipient takes, it is not something that can be handed to him.

Here is a farmer boy working in the greatest school that ever existed, walking all day long on the greatest textbook ever written. If he could master the secrets of one acre, or even one square foot of land, he would be a learned man. There are more things to be learned on one farmstead than in Harvard, Yale and Princeton put together; though it sometimes occurs that the young man doesn't know this until he has gone through school first.

We are a nation of casual readers. We read to escape thinking. Reading has become a dope habit with us. Learning has become a thing of accent and of facts. It is "learning" to have read the latest novel, but not to know that it's a silly, trivial thing. It is "learning" to have looked into this or that book-suffocated man's speculation, but not to know that he would be a wiser man and have more wholesome blood coursing through his brain if he would take a hammer or an ax and get out where he could sense life. Book-sickness is the modern ailment. There's more wisdom in the shop where men deal with real materials and real persons every day.

What can you do to help and heal the world?—that is the educational test. If a man can hold up his own end, he counts for one. If he can help ten or a hundred or a thousand other men hold up their ends, he counts for more. He may be quite rusty on many things that inhabit the realm of print, but he is a learned man just the same. When a man is master of his own sphere, whatever it may be, he has won his degree—he has entered the realm of wisdom.

THEY are at it again, trying to determine when a man is educated. A man is educated when he knows how to do what he can do, and extract from his performance a sufficient economic, intellectual and spiritual satisfaction. A man who cannot do that is not educated, no matter what his knowledge of books may be. That man is best educated who knows the greatest number of things that are so, and who can do the greatest number of things to help and heal the world. Schools are useful only as they put men in possession of their own powers; and they cannot do this without the earnest desire of their students to be so helped. Any man can learn anything he will, but no man can teach except to those who want to learn. Education is pre-eminently a matter of quality, not amount.

West Point cadet battalion, now a regiment, on parade: formation includes whole body of 1,334 cadets.

The West Point of Today

Impressions During a Flying Visit to the Nation's Storied War School

By PAUL TYNER

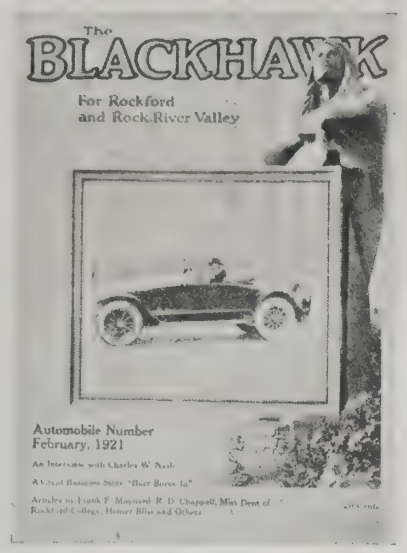
THE Hudson has often been called "the Rhine of America." As far as picturesqueness of natural scenery is concerned, possibly there are recently returned Americans who would say that it is the Rhine rather than the Hudson that is flattered by the comparison. "Over There," the feature of the Rhine scenery that most impresses voyagers from the New World is the succession of ancient castles, most of them in ruins, that dot the banks of the famous river that has been so long the bone of Franco-German contention. We are short of ruins on this side, so the foreign article has the attraction of the exotic. Old castles especially stir the sense of the romantic. They awaken in the imagination tales of the age when chivalry was in flower. There may, moreover, be latent in many of us some faint instincts of ancestral connection with the golden glories of which these castles are the broken vestiges and monuments.

Rounding the Highlands of the Hudson at West Point, however, one comes suddenly on a great Gothic structure which might well carry the mind's eye back to the Rhine. In its massive gray bulk, its castellated square towers and frowning aspect of command of the river approaches in either direction, the fortification that so fitly marks the situation of the nation's great military academy strikes the beholder as the very embodiment of the spirit of medieval feudalism—of an age when fighting was the chief occupation of the people and the only career open to men of "gentle" blood and high ambition. Yet there is nothing ruinous in the aspect of West Point's grim bastions. Ancient as their architecture may be, they are aggressively up-to-date in their construction. Their strength is the strength of America—the strength of youth.

Vague thoughts of this sort were called out by the challenging aspect of the big stone tower when I faced it on a recent spring afternoon upon descending at the West Point station after a two hours' run on the West Shore road from New York. The young kinsman whom I had last seen as a rather lively boy of 12 was there to meet me. Now he was a "plebe" of nine months' standing. In his gray uniform, his straight figure and soldierly bearing, the little fellow I knew had undergone a striking transformation. Yet I knew the boy in the smiling eyes of this fine young fellow that grasped my hand. As we ascended the hill to the great quadrangle of buildings surrounding the parade ground, I found him as likable as ever. There was something charming in his enthusiasm for his chosen calling and for the historic school of which he had become a part. And the charm was not lessened by a suggestion of childhood's sweet innocence in the boy's undoubted manliness. He blushingly turned aside the well-worn jests about future fame as a general by glowing expatiation of the appeal to all that was best in a cadet, in the splendid traditions of West Point, of the high standard of character and conduct that were maintained there, and of the serious effort required on the part of every man to do his full duty.

The discipline must be especially severe during the first or plebe year on a youngster who had carried off the honors in class and athletic field in his Middle West town high school, had been a popular favorite and editor of the school magazine. No home leave for a whole year. No dances. No shining place on the football eleven or the baseball nine. Held to strict accountability for every moment of time day and night; summoned from bed at 6 a. m. by the bugle's reveille seconded by a cannon's boom and the persistent ringing of a big brass gong in the dormitory corridor. Then it's away to the parade ground in response to further bugle calls for the ceremony of salute to the flag and the punctilious parade in formation of fours to the big mess hall.

My young relative took me through this mess room and explained the etiquette of its tables whereat the plebe is reduced to due and humble reverence for the upper class men. He explained, however, that under the present administration hazing has really been abolished and with it the ancient strong-arm methods, under which when a plebe did not pass the bread or the butter promptly enough, he received a forcible reminder of his duty in the shape of a glass or a plate thrown in his face. Democracy is all very well but an "officer and a gentleman" must be taught deference to his seniors.



United States Military Academy shield and seal. Motto: "Duty, Honor, Country."

"All that sort of Prussianism," the boy told me earnestly, "is now frowned upon as contrary to the true American spirit." Here, as in the library, the walls are lined with portentous portraits of American generals in full dress. Everything is neat and clean as a new pin and the great airy kitchens opening from the mess hall with their polished ranges, shining nickeled soup caldrons and coffee urns and brilliant copper batteries *de cuisine* are a credit to the management. My youthful kinsman assured me that the "eats" are really good; the fare is as substantial as plentiful and well-cooked. I can assure anxious mothers all over the land that their boys at West Point certainly have every appearance of being well-fed. And their teeth are well looked after, as well as their table manners.

Just now, here and there, the dormitories are a bit crowded, because of a large increase in the number of cadets since the war; but new and handsome buildings are nearing completion. These will make it possible to have not more than two cadets in a room. Strict attention is paid to sanitation and hygiene and the army medical officers of the post seem to have a high appreciation of preventive medicine. When anything, which in the world outside West Point is regarded as a "slight symptom" in the shape of a "cold," manifests itself the victim is promptly quarantined and kept under watch. But it appears that the boys consider any one of their number who succeeds in getting into hospital for a week as much to be envied. It means a welcome respite in the eternal grind of drills and parades and inspections and lessons. Of course, the healthy-minded and healthy-bodied youngster does not linger in hospital precincts. When he is rested, he is only too eager to get back on the job.

While life at West Point is not all cakes and ale it has its ameliorations. Foremost of these ranks the gymnasium and the place given to field athletics. In a visit to the gymnasium, I felt that the whole place breathed the atmosphere of that joyous enthusiasm which, more than anything else, expresses the spirit of youth. Something of "the glory that was Greece" is brought back by the vigor and vim and the light-

Home boosting, its mission.

Rockford's Home Magazine for the Home Folk

"It Is for the Man Whose Heart Is Rich With Love for His Fellow Beings, Whose Hand Holds the Wealth of Public Spirit, Whose Life Is Governed by the Golden Rule."

O. LAWRENCE HAWTHORNE,
Editor and Manager

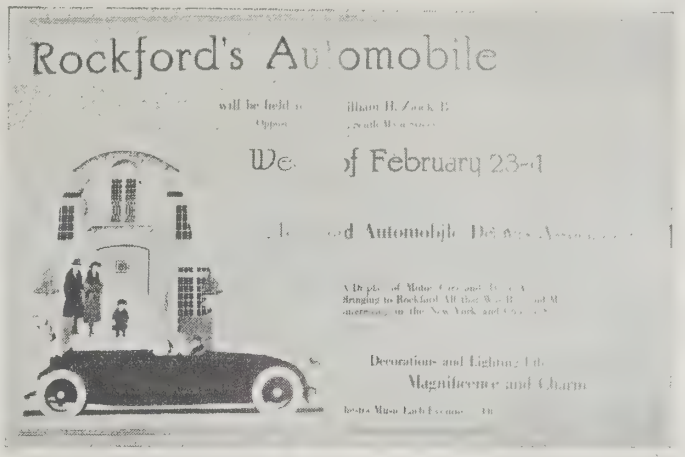
COMMUNITY clubs are common, city associations are widely recognized, but the magazine which prints only stories on the life of a locality is very young.

When the group of enthusiasts had published the first issue of Rockford's own magazine, the city sat back comfortably to watch the venture from the side lines. But the team was too much alive and in a few short months the sideliners entered the center of the field to take an active part in the game of boosting their "forest city."

We don't know our neighbors even in small towns, much less do we appreciate our mutual assets unless some such municipal house organ supplies the information. *The Blackhawk* is Rockford's own magazine carrying the mission of the city to its own folk.

When Lawrence Hawthorne, originator of the "Forest City Magazine" idea, looked about for a name, he found none better than that of the famous Indian chieftain whose name spells romance and tradition to an entire river valley. The historical Blackhawk trail follows the banks of the Rock River, across the Illinois boundary line into Wisconsin, past the Four Lakes City (Madison) and then through the dells of the Wisconsin River until it ends as did the venture of the bold Indian—at the Mississippi. Had he deserted his women and children, the red man could have saved himself and his warriors, and it is for this genuine touch of chivalry together with the motto of the chief "fair fighting but a fight to the death in defense of his heritage" that inspired the erection of a statue on the banks of the Rock River.

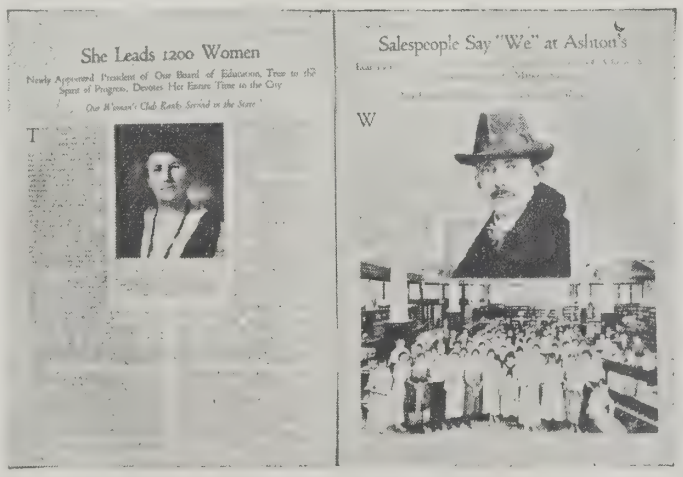
By the editor, *The Blackhawk* is likened to the Indian noble, for it is "neither papoose nor squaw but a warrior ready to fight for a better Rockford city and countryside.



"It is a rich man's magazine, but it is only for the man whose heart is rich with love for his fellow beings, whose hand holds the wealth of public spirit and whose life is governed by the golden rule rather than the rule of gold.

"Our sympathy is with the man who works, no matter if it be with his hands or his head and provided that his work is honorable and considerate of others. We desire that it may serve as the medium through which the Chamber of Commerce, the Manufacturers' and Shippers' Association, businessmen's clubs, the American Legion, educational, religious, social and athletic bodies and the city government may effect closer co-operation and more surely build for municipal leadership."

Even the first issue was a success and the governor of the state sent a letter of congratulation to the northern Illinois city in which he prophesied the great future of such a publication in "the beautiful city in a beautiful valley."



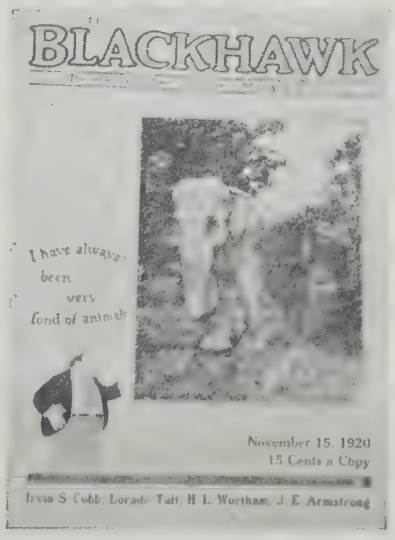
Six months after the magazine appeared and from a surprise which came like a searchlight in a dark night, *The Blackhawk* had grown to a circulation of four thousand and had begun to pay for itself in advertising. Human interest events and articles are featured, good stories seem to appear from nowhere and the city admits it to be a "regular magazine." Better homes, unusual people, a unique industry, anything new or proposed for the city, all find space and welcome.

Already the booster is getting busy and community pride is crystallizing around the idea of a home magazine for home folk. The mail carrier says many magazines leave the city and I can imagine the letter which goes with them— "Yes, sir, I tell you this town is filled with stuff just like that. We've got enough to last for all time too, because the rising generation is going to keep the irons hot while it makes this one of the best little old cities in the country. Watch us grow. Nothing anywhere ever beat this idea for putting community spirit into a city and I'm for it and the editor. Better drive around this way on your trip next summer."

Advertising carries the printing cost.

Newspapers in a city do a splendid work but they lack time, space, and facility to devote to just such articles as are needed in a special magazine. Hardly a man in the city knows the number and extent of the factories, the amount of imports and exports or even a dozen traditions about the founding of the place, how the parks came to exist, who the men are who care for the city's public property, what the music clubs are doing or the programs for advancement being sponsored in every group of live-wires who meet after a meal in club or home to thresh out the future of the city beautiful. All these things Editor Hawthorne is printing for his city.

Articles like these make boosters.



Nor will the business man take time to read newspaper articles for with only fifteen minutes of the day devoted to the reading of a daily paper he isn't concerned with anything but "news." But a neat booklet which comes once a month is different; it can readily be taken up during leisure hours—the proper time to be interested in civic betterment. That is why a booster magazine for a city can do much when the time arrives for giving complete facts on a new movement, in abolishing the prejudice and in blending all the grumbles into one long hurrah of "Boost for the Home City."

The Blackhawk is busy today teaching Rockford citizens a more human pride in family, town and valley, and fifty pages of reading matter interestingly written are teaching, as one business man said, "the inspiration which may be had from real men, the lack of substance found in the 'weedy' men and women, and the general contentment and sympathy so essential to all humans as we live together. It is fresh, vigorous, snappy and whether we are young or old we step along the street a bit livelier when we begin to appreciate what a decent sort of world it is in which we live."

Of course it is not every town of the size of Rockford that is capable of furnishing newspapermen of the requisite breadth of view and literary sense to produce such a monthly, or readers likely to appreciate it. The success of *The Blackhawk*, however, should prove an encouragement to any community with a spark of ambition. E. W. Howe's "Story of a Country Town," or Sinclair Lewis's "Main Street," might not be such faithful transcriptions of the deadly dullness and painful narrowness of life in so many of our American communities, if more of them were enlivened and encouraged by this sort of magazine.

And if some of the bright young men who hie them to the big cities on leaving college and eke out a precarious existence, hanging on to the fringes of metropolitan journalism, were to follow Larry Hawthorne's example and apply themselves to cultivating the possibilities of this field in the old home town, they might find their acres of diamonds close at hand.

The Modern Blackhawk

Angles of Jewish Influence in American Life

The Jewish Idea Attacks Economic, Cultural and Church Traditions of the Anglo-Saxon; Invading Labor Union, College and Pulpit

THE Jewish Question exists wherever Jews appear, says Theodor Herzl, because they bring it with them. It is not their numbers that create the Question, for there is in almost every country a larger number of other aliens than of Jews. It is not their much-boasted ability, for it is now coming to be understood that, give the Jew an equal start and hold him to the rules of the game, he is not smarter than anyone else; indeed, in one great class of Jews the zeal is quenched when opportunity for intrigue is removed.

The Jewish Question is not in the number of Jews who here reside, not in the American's jealousy of the Jew's success, certainly not in any objection to the Jew's entirely unobjectionable Mosaic religion; it is in something else, and that something else is the fact of Jewish influence on the life of the country where Jews dwell; in the United States it is *the Jewish influence on American life.*

That the Jews exert an influence, they themselves loudly proclaim. One is permitted to think that they really claim a stronger influence than they possess, especially in those higher regions where excellent and determinative influences have been at work. The Jews claim, indeed, that the fundamentals of the United States are Jewish and not Christian, and that the entire history of this country should be rewritten to make proper acknowledgment of the prior glory due to Judah. If the question of influence rested entirely on the Jewish claim, there would be no occasion for doubt; they claim it all. But it is kindness to hold them to the facts; it is also more clearly explanatory of conditions in our country. If they insist that they "gave us our Bible" and "gave us our God" and "gave us our religion," as they do over and over again with nauseating superciliousness throughout all their polemic publications—*not a single one of these claims being true*—they must not grow impatient and profane while we complete the list of the real influences they have set at work in American life.

It is not the Jewish people but *the Jewish idea,* and the people only as vehicles of the idea, that is the point at issue. As it was Prussianism and not the German people that was the objective in the recent war, so in this investigation of the Jewish Question, it is Jewish influence and the Jewish Idea that are being discovered and defined.

The Jews are propagandists. This was originally their mission. But they were to propagate the central tenet of their religion. This they failed to do. By failing in this they, according to their own Scriptures, failed everywhere. They are now without a mission of blessing. Few of their leaders even claim a spiritual mission. But the mission idea is still with them in a degenerate form; it represents the grossest materialism of the day; it has become a means of sordid acquisition instead of a channel of service.

I.

Changing the Labor Tradition

THE essence of the Jewish Idea *in its influence on the labor world* is the same as in all other departments—the destruction of real values in favor of fictitious values. The Jewish philosophy of money is not to "make money," but to "get money." The distinction between these two is fundamental. That explains Jews being "financiers" instead of "captains of industry." It is the difference between "getting" and "making."

The creative, constructive type of mind has an affection for the thing it is doing. The non-Jewish worker formerly chose the work he liked best. He did not change employment easily, because there was a bond between him and the kind of work he had chosen. Nothing else was so attractive to him. He would rather draw a little less money and do what he liked to do, than a little more and do what irked him. The "maker" is always thus influenced by his liking.

Not so the "getter." It doesn't matter what he does, so long as the income is satisfactory. He has no illusions, sentiments or affections on the side of work. It is the "geld" that counts. He has no attachment for the things he makes, for he doesn't make any; he deals in the things which other men make and regards them solely on the side of their money-drawing value. "The joy of creative labor" is nothing to him, not even an intelligible saying.

Now, previous to the advent of Jewish socialistic and subversive ideas, the predominant thought in the labor world was to "make" things and thus "make" money. There was a pride among mechanics. Men who made things were a sturdy, honest race because they dealt with ideas of skill and quality, and their very characters were formed by the satisfaction of having performed useful functions in society. They were the Makers. And society was solid as long as they were solid. Men made shoes as exhibitions of their skill. Farmers raised crops for the inherent love of crops, not with reference to far-off money-markets. Everywhere The Job was the main thing and the rest was incidental.

The only way to break down this strong safeguard of society—a laboring class of sturdy character—was to sow other ideas among it; and the most dangerous of all the ideas sown was that which substituted "get" for "make." With the required manipulation of the money and food markets, enough pressure could be brought to bear on the ultimate consumers to give point to the idea of "get," and it was not long before the internal relations of American business were totally upset, with Jews at the head of the banking system, and Jews at the head of both the conservative and radical elements of the Labor Movement, AND, most potent of all, the Jewish Idea sowed through the minds of workingmen. What Idea? The old idea of "get" instead of "make."

The idea of "get" is a vicious, anti-social and destructive idea *when held alone;* but when held in company with "make" and as second in importance, it is legitimate and constructive. As soon as a man or a class is inoculated with the strictly Jewish Idea of "getting"—("getting mine;" "getting while the getting is good;" "honestly if you can, dishonestly if you must—but *get* it"—all of which are notes of this treasonable philosophy), the very cement of society loses its adhesiveness and begins to crumble. The great myth and fiction of Money has been forced into the place of real things, and the second step of the drama can thus be opened up.

Jewish influence on the thought of the workingmen of the United States, as well as on the thought of business and professional men, has been bad, thoroughly bad. This is not manifested in a division between "capital" and "labor," for there are no such separate elements; there is only the executive and operating departments of American business. The real division is between the Jewish idea of "get" and the Anglo-Saxon idea of "make," and at the present time the Jewish idea has been successful enough to have caused an upset.

All over the United States, in many branches of trade, Communist colleges are maintained, officered and taught by Jews. These so-called colleges exist in Chicago, Detroit, Cleveland, Rochester, Pittsburgh, New York, Philadelphia and other cities, the whole intent being to put all American labor on a "get" basis, which must prove the economic damnation of the country. And that, apparently, is the end sought, as in Russia.

Until Jews can show that the infiltration of foreign Jews and the Jewish Idea into the American labor movement has made for the betterment in character and estate, in citizenship and economic statesmanship, of the American workingman, the charge of being an alien, destructive and treasonable influence will have to stand.

II.

Jewish-German Higher Criticism

THE last place the uninstructed observer would look for traces of Jewish influence is in the Christian church, yet if he fail to look there he will miss much. If the libraries of our theological seminaries were equipped with complete files of Jewish literary effort in the United States during the past 15 years, and if theological students were required to read these Jewish utterances, there would be less silly talk and fewer "easy marks" for Jewish propaganda in the American pulpit. For the next 25 years every theological seminary should support a chair for the study of Modern Jewish Influence and the Protocols. The fiction, that the Jews are an Old Testament people faithful to the Mosaic Law, would then be exploded, and timid Christians would no longer superstitiously hesitate to speak the truth about them because of that sadly misinterpreted text: "I will bless them that bless thee, and curse him that curseth thee."

There is a mission for the pulpit to liberate the Church from what the New Testament Scriptures call "the fear of the Jews."

The pulpit has also the mission of liberating the Church from the error that Judah and Israel are synonymous. The reading of the Scriptures which confuse the tribe of Judah with Israel, and which interpret every mention of Israel as signifying the Jews, is at the root of more than one-half the confusion and division traceable in Christian doctrinal statements.

The Jews are *not* "The Chosen People," though practically the entire Church has succumbed to the propaganda which declares them to be so.

The Jewish tinge of thought has of late years overspread many Christian statements, and the uninstructed clergy have proved more and more amenable to Jewish suggestion.

The flaccid condition of the Church, so much deplored by spokesmen who had regard for her inner life, was brought about not by "science," not by "scholarship," not by the "increase of light and learning"—for none of these things are antagonistic even to incomplete statements of truth—but by *Jewish-German higher criticism.*

The defenders of the faith have fought long and valiantly against the inroads made by the so-called Higher Criticism, but were sadly incapacitated in their defense, because they did not see that its origin and purpose were Jewish. It was not Christian; it was not German; it was Jewish. It is almost wholly discounted today in the practical life of the church, but it still adheres to the darker corners of the colleges, along with the Red Bolshevism which is taking root there under Jewish influences.

Let the Christian minister who wishes to know the source of Jewish influence in the church look over the names of the more notorious "German" Higher Critics of the Bible, and consider their race. Add to them one Frenchman, an atheist and a Jew, and you have modern "liberal" sources very complete:

Wellhausen	Kuehne
Strauss	Hitzig
Ewald	Renan

It is perfectly in keeping with the Jewish World Program that this destructive influence should be sent out under Jewish auspices, and it is perfectly in keeping with non-Jewish trustfulness to accept the thing without looking at its source. A great many so-called "liberals" played the Jewish game for a time; they are now coming back to the old citadel which stood in its own strength and without their patronage while the fever of the Higher Criticism raged.

The Church is now victim of a second attack against her, in the rampant Socialism and Sovietism that have been thrust upon her in the name of flabby and unmoral theories of "brotherhood" and in an appeal to her "fairness." The church has been made to believe that she is a forum for discussion and not a high place for annunciation. She has been turned from a Voice into an echo of jangling cries. Jews have actually invaded, in person and in program, hundreds of American churches, with their subversive and impossible social ideals, and at last became so cocksure of their domination of the situation that they were met with the inevitable check.

Clergymen ought to know that seven-eighths of the economic mush they speak from the pulpit is prepared by Jewish professors of political economy and revolutionary leaders. They should be informed that economic thought has been so completely Judaized by means of a deliberate and masterly plan of camouflaged propaganda, that the mass-thought of the crowd (which is the thought mostly echoed in "popular" pulpits and editorials) is more Jewish than Jewry itself holds.

The Jew has got hold of the church in doctrine, in liberalism, so-called, and in the feverish and feeble sociological diversions of many pulpits and adult classes.

If there is any place where a straight study of the Jewish Question should be made, with the Bible always in hand as the authoritative textbook, it is in the modern church which is unconsciously giving allegiance to a mass of Jewish propaganda.

III.

Jewish Virus in College Life

IT IS not reaction that is counseled here; it is progress along constructive paths, the paths of our forefathers, the Anglo-Saxons, who have to this day been the World-Builders, the Makers of cities and commerce and continents; and not the Jews who have never been builders or pioneers, who have never peopled the wilderness, but who move in upon the labors of other men. They are not to be blamed for not being Builders and Pioneers, perhaps; they are to be blamed for claiming all the rights of pioneers; but even then, perhaps, their blame ought not to be so great as the blame that rests upon the sons of the Anglo-Saxons for rejecting the straightforward Building of their

fathers, and taking up with the doubtful ideas of Judah.

Colleges are being constantly invaded by the Jewish Idea. The sons of the Anglo-Saxon are being attacked in their very heredity. The sons of the Builders, the Makers, are being subverted to the philosophy of the destroyers. Young men in the first exhilarating months of intellectual freedom are being seized with promissory doctrines, the source and consequences of which they do not see. There is a natural rebelliousness of youth, which promises progress; there is a natural venturesomeness to play free with ancient faiths; both of which are ebullitions of the spirit and significant of dawning mental virility. It is during the periods when these adolescent expansions are in process that the youth is captured by influences which deliberately lie in wait for him in the colleges. True, in after years a large proportion come to their senses sufficiently to be able "to sit on the fence and see themselves go by," and they come back to sanity. They find that "free love" doctrines make exhilarating club topics, but that the Family—the old-fashioned loyalty of one man and one woman to each other and their children is the basis, not only of society, but of all personal character and progress. They find that Revolution, while a delightful subject for fiery debates and an excellent stimulant to the feeling of supermanlikeness, is nevertheless not the process of progress.

And, too, they come at length to see that the Stars and Stripes and the Free Republic are better far than the Red Star and Soviet sordidness.

When a Supreme Court Justice addressed one of the greater American universities, a student came to him after a lecture and said: "It gave me so much pleasure to hear your lectures, for they were *the first kindly words I have heard said about our government since the commencement of my university career.*"

For years the secular magazines have been carrying articles on the question, *"What Is Wrong With the Colleges?"* The answer is perfectly clear to those who can discern Jewish influence in American life.

The trouble with the colleges has progressed along precisely the same lines that have been described above in connection with the churches. First, Jewish higher criticism in the destruction of young men's sense of respect for the ancient foundations; second, Jewish revolutionary social doctrines. The two always go together. They cannot live apart. They are the fulfillment of the Protocol's program to split non-Jewish society by means of ideas.

Red Propaganda in the Colleges

IT IS idle to attack the "unbelief" of college students, idle to attack their "radicalism"—these are always the qualities of immaturity. But it is not idle to show that social radicalism ("radicalism" being a very good word very sadly misused) and antagonism to the religious sanctions of the moral law, both come from the same source. Over the fountain of Revolutionism and Anti-Christian belief place the descriptive and definitive term "Jewish," and let the sons of the Anglo-Saxons learn from what waters they are drinking. That source is not Mosaic, but Jewish—there is a world of difference between them.

The central groups of Red philosophers in every university is a Jewish group, with often enough a "Gentile front" in the shape of a deluded professor. *Some of these professors are in the pay of outside Red organizations.* There are Intercollegiate Socialist Societies, swarming with Jews and Jewish influences, and toting Jewish professors around the country, addressing medics and lits and even the Divinity schools, under the patronage of the best civic and university auspices. Student lecture courses are fine pasture for this propaganda. Intercollegiate Liberal Leagues are established everywhere, the purpose evidently being to give students the thrill of believing that they are taking part in the beginning of a great new movement, comparable to the winning of Independence or the Abolition of slavery. As stein parties gradually cease as a college diversion, Red conferences will come in; it is part of the effervescence of youth.

The revolutionary forces which head up in Jewry rely very heavily on the respectability which is given their movement by the adhesion of students and a few professors. It was so in Russia—everyone knows what the name "student" eventually came to signify in that country. And as a result, while Sovietists are glorifying the "success" of the Revolution, men like Maxim Gorky are sending out appeals for food to prevent the intelligentsia from starving to death.

The Students and Racial Loyalty

THE Jewish Chautauqua, which works almost exclusively in colleges and universities, together with Bolshevism in art, science, religion, economics and sociology, are driving straight through the Anglo-Saxon traditions and landmarks of our race of students. And these are ably assisted by professors and clergymen whose thinking has been dislocated and poisoned by Jewish subversive influences in theology and sociology.

What to do about it? Simply identify the source and nature of the influence which has overrun our colleges. Let the students know that their choice is between the Anglo-Saxons and the Tribe of Judah. Let the students decide, in making up their allegiance, whether they will follow the Builders or those who seek to tear down.

It is not a case for argument. Radicalism and religious indifferentism are states of mind. Normal men usually grow out of them in good time. Others are caught and held to the end. But the treatment is not argument.

The only absolute antidote to the Jewish influence is to call college students back to a pride of race. We often speak of the Fathers as if they were the few who happened to affix their signature to a great document which marked a new era of liberty. The Fathers were the Men of the Anglo-Saxon-Celtic Race. The men who came across Europe with civilization in their blood and in their destiny; the men who crossed the Atlantic and set up civilization on a bleak and rock-bound coast; the men who drove west to California and north to Alaska; the men who peopled Australia and seized the gates of the world at Suez, Gibraltar and Panama; the men who opened the tropics and subdued the arctics—Anglo-Saxon men, who have given form to every government and a livelihood to every people and an ideal to every century. They got neither their God nor their religion from Judah, nor yet their speech nor their creative genius—they are the Ruling People, Chosen throughout the centuries to Master the world, by Building it ever better and better and not by breaking it down.

Into the camp of this race, among the sons of the rulers, comes a people that has no civilization to point to, no aspiring religion, no universal speech, no great achievement in any realm but the realm of "get," cast out of every land that gave them hospitality, and these people endeavor to tell the sons of the Saxons what is needed to make the world what it ought to be.

If our sons in college follow this counsel of dark rebellion and destruction, it is because they do not know whose sons they are, of what race they are the scions.

Let there be free speech to the limit in our universities and free intercourse of ideas, but let Jewish thought be labeled Jewish, and let our sons know the racial secret.

The warning has already gone out through the colleges. The system of procedure is already fully known. And how simple it is:

First, you secularize the public schools—"secularize" is the precise word the Jews use for the process. You prepare the mind of the public school child by enforcing the rule that no mention shall ever be made to indicate that culture or patriotism is in any way connected with the deeper principles of the Anglo-Saxon religion. Keep it out, every sight and sound of it! Keep out also every word that will aid any child to identify the Jewish race.

Then, when you have thus prepared the soil, you can go into the universities and colleges and enter upon the double program of pouring contempt on all the Christian landmarks, at the same time filling the void with Jewish revolutionary ideas.

The influence of the common people is driven out of the public schools, where common people's influence can go; but Jewish influence is allowed to run rampant in the higher institutions where the common people's influence cannot go.

Secularize the public schools, and you can then Judaize the universities.

IV.

Let the Struggle Be a Fair One

THIS is the "liberalism" which Jewish spokesmen so much applaud. In labor unions, in church, in university, it has tinctured the principles of work, faith and society. This will not be denied, because the proof of it is too thickly written over Jewish activities and utterances. Indeed, it is in exerting these very influences that Jewry convinces itself it is fulfilling its "mission" to the world. The capitalism attacked is non-Jewish capitalism; the orthodoxy attacked is Christian orthodoxy; the society attacked is the Anglo-Saxon form of society, all of which by their destruction would redound to the glory of Judaism.

The list could be extended—the influence of the Jewish idea on Anglo-Saxon sports and pleasure, on the Anglo-Saxon-Celtic idea of patriotism, on the Anglo-Saxon-Celtic conception of the learned professions; the influence of the Jewish idea runs down through every department of life.

"Well," one very badly deluded Anglo-Saxon editor, wrapped up in Jewish advertising contracts, was heard to say, "If the Jews can get away with it, then they have a right to." It is a variant of the "answer" of Jewish origin, which runs thus: "How can a paltry 3,000,000 run the 100,000,000 of the rest of us? Nonsense!"

Yes, let it be agreed; if the Jewish idea is the stronger, if the Jewish ability is the greater, let them conquer; let Anglo-Saxon principles and Anglo-Saxon power go down in ruins before the Tribe of Judah. *But first let the two ideas struggle under their own banners; let it be a fair struggle.* It is not a fair fight when in the movies, in the public schools, in the Judaized churches, in the universities, the Anglo-Saxon idea is kept away from Anglo-Saxons on the plea that it is "sectarian" or "clannish" or "obsolete" or something else. It is not a fair fight when Jewish ideas are offered as Anglo-Saxon ideas, because offered under Anglo-Saxon auspices. Let the heritage of our Anglo-Saxon-Celtic fathers have free course among their Anglo-Saxon-Celtic sons, and the Jewish idea can never triumph over it, in university forum or in the marts of trade. The Jewish idea never triumphs until first the people over whom it triumphs are denied the nurture of their native culture.

Judah has begun the struggle. Judah has made the invasion. Let it come. Let no man fear it. But let every man insist that the fight be fair. Let college students and leaders of thought know that the objective is the regnancy of the ideas and the race that have built all the civilization we see and that promise all the civilization of the future; let them also know that the attacking force is Jewish.

That is all that will be necessary. And it is against this that the Jews protest. "You must not identify us," they say, "You must not use the term 'Jew.'" Why? Because unless the Jewish idea can creep in under the assumption of other than Jewish origin, it is doomed. Anglo-Saxon ideas dare proclaim themselves and their origin. A proper proclamation is all that is necessary today. Compel every invading idea to run up its flag!

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

A second book, containing the second twenty articles, will soon be ready and may be ordered now.

Jewish World Notes

A Jewish publication, ever with an eye to business, is making a "confidential" circulation drive on the strength of the statement that "a definite date has been set for an early trial" in which THE DEARBORN INDEPENDENT "will have to prove the accusations against the Jews." The soliciting letter continues: "This fact is not being spread broadcast because it is not desired to offer any opportunity to the enemies of the Jews to stage any sensational plays that may ruin the efforts" to muzzle THE DEARBORN INDEPENDENT. As a matter of fact, there are some aspects of the Jewish Question which can only be opened in court, and the higher the court the better, that the highest authority may take cognizance.

But is it quite fair to the other Jewish publications in the country to keep this choice tidbit for the profit of one publication only? Why not permit the scores of Jewish papers to use this bait? THE DEARBORN INDEPENDENT has proved a very good business getter for many Jews. Practically every Jewish organization has increased its membership on the plea that it is necessary to "get" THE DEARBORN INDEPENDENT. Money in large sums have been collected—now to smother THE DEARBORN INDEPENDENT under the flood of printed propaganda, now to back a cheap automobile, now to stage a thousand lawsuits, now to establish new propaganda sheets or to "convert" purchasable sheets already existing, now just plainly to "get" the individuals concerned. Why don't the Jews of the United States wake up? Why can't they see that their difficulty comes only from within themselves? Are there no prophets left in Judah? Are there only profiteers?

So numerous have been the defections of Jews toward Christian Science that at least one rabbi has introduced into his synagogue a "healing service" modeled after that of the Emmanuel Episcopal Church, Boston. Never in the lead!

Mme. Curie, one of the world's most distinguished and useful scientists arrived in New York the other day. Was she given the "freedom of New York" as was Einstein? Certainly not! She is not Jewish!

"Revolutionists signing themselves 'The United Communist Party of America' and 'The American Freedom Foundation' are believed to have inserted in many copies of the Jewish papers of this city circulars calling for a May Day revolution. These inflammatory circulars were found by persons who bought Jewish newspapers today."—*Evening Globe,* New York.

Two Westerners—and What They Mean to You

By WILLIAM ATHERTON DU PUY

I SAT in a high apartment building in Washington at night and looked out over that city from which a nation is governed, meditating on what lay beneath me until I got to talking to myself and this is what I said:

Of all pictures created of paper and ink, which is most familiar to the individuals who go to make up that homogeneous people 117 million strong all speaking the same language and calling themselves Americans?

I paused for an answer until I felt that some psychic end man must have responded: "Well, Mr. Bones, what picture is most familiar?" and I replied:

The picture of a dome emerging from the trees of a gently rising hill—in fact, the dome of yonder Capitol Building where the light at its tip indicates that Congress is meeting in night session on the people's business.

That building has come to be almost synonymous with Old Glory, to stand for that world figure which is the young giant among nations and at the same time the grandfather of free institutions impersonating the government of the United States.

The Capitol yonder, I thought, is the fountain source of government. From beneath it bubbles the double spring of beneficent laws, flowing from the House and Senate and watering all the world that lies beneath the flag.

Who, I wonder, are the individuals sitting at the headwaters there and regulating the flow of that stream? Who today are the most powerful men on Capitol Hill at Washington?

To get the answer to that question I made a week-long canvass and this was the result—Smoot, of Utah, and Mondell, of Wyoming: Smoot in the Senate and Mondell in the House.

Remembering the days of Aldrich and Payne, of Crane and Cannon, I concluded that the center of influence was moving west. Checking over the biographies of the two I found that, contrary to the general run of these self-prepared sketches, neither was a lawyer, neither had taught school, neither made any claim to having been a farmer. I would go to see these two men and ask each how he got where he is.

Senator Reed Smoot, I knew, is an apostle in the Mormon church of Utah. He has been in the Senate for eighteen years and is elected for another six-year term. He has reached the age of 59, is six feet two and weighs 190 pounds. Physically he is a remarkable specimen of manhood, big-boned, vigorous, carrying no undue flesh. Since the day of his birth, he says, he has never known an illness. He is blue-eyed, well thatched with stubby hair, has a close-cropped mustache, is old American stock.

Smoot is chairman of the joint committee of Congress which has in hand the reorganization of the government departments. This means that he is the efficiency expert who will, within the year, rearrange and regroup all those bureaus through which the government functions.

He is chairman of the joint committee on printing which says what may and what may not be published by government agencies. Some of the departments are likely to say that he is an autocratic and unsympathetic czar, that he is not a competent judge of the matter that a scientific bureau should print.

He is chairman of the Senate Committee on public lands, of the committee on expenditures in the Interior Department. He is second man on the all powerful committee on appropriations and pensions. He ranks third on the committee on finance, fourth on civil service, sixth on territories.

I asked Senator Smoot how he gained such power in the Upper House. He said he did it by working. He stated that there was just one thing to which he credited every success he had made in life—work. He protested himself a plain man with a commonplace mind.

I asked this man how many hours a day he worked. He said that he stuck at it 16 hours every day but sometimes he worked 18. He never stops for golf or baseball. He believes that the theory that one should set aside certain time for recreation is all piffle. He has never played and never taken a vacation. To all appearances he is the fittest man of 59 in the Senate. He recommends seven hours sleep in twenty-four as recreation. He snaps off consciousness with the light, sleeps until he is normally refreshed, gets up and goes to work again.

When Senator Smoot first came to Congress he was put on the committee on claims. It was the dullest, dryest assignment to be had. There were thousands of persons praying for relief by the government from some loss, real or imagined. Each claim was fortified by endless settings forth of facts, arguments, hearings. No other man ever dug through these claims as did the young Senator from Utah. He worked on them sixteen hours a day.

So it came to pass that, when a case came up, Smoot would be asked the gist of it. He would set forth the facts, baldly, prosaically, but correctly. It has not often happened in 18 years that anybody has disproved Smoot's facts.

The older Senators began to notice that this man was very useful. He was a great digester of intellectual food that was unpalatable to the majority. Finally the time came when the tariff was to be revised. The Aldrich tariff commission, something more than a decade ago, made one of the most exhaustive studies of that complicated subject ever undertaken. Smoot was made a member of that commission. He ground those 16 hours a day for years on tariff. He came to be a walking encyclopedia of tariff schedules. He could reel them off, past, present and proposed, without end. He was instinctively a high protectionist. Though his father was a Kentucky Democrat he had chosen for himself the Republican fold. His views agreed with those of the men who dominated the Senate. He proved very useful. His knowledge was a matter of great satisfaction to his associates. They did not need to look up the facts. They asked Smoot.

Gradually Smoot has been gathering to himself more and more power. It comes because he is willing to shoulder the work. Few Senators work hard enough to master the detail of the government machine. Smoot does. He is a horse for work. He accepts any job put on him, works until he gets on top of it, adds that much power to himself.

So, today, he is sometimes called the general manager of the United States. It is undoubtedly true that he has more to do with the actual operation of the government than any other man on Capitol Hill. I asked Senator Smoot where he got this idea of happiness through work. He said that his mother taught it to him. She had come to Utah with the early migration of the Mormons. The settlers came on foot. His mother was a girl of eighteen. She walked and pushed a handcart from the Missouri River to Utah. There she took vigorous part in carving an empire out of the plains.

(C) Harris & Ewing

Above—SENATOR REED SMOOT, of Utah.

Left—REP. FRANK MONDELL, of Wyoming.

She believed in work, taught it to her boy. When he was in grammar school he worked Saturdays and holidays in a woolen mill near by. He worked awhile on one machine and awhile on another. He found it a lot of fun to master one machine after another. Boys love machinery. He believes that he had as good a time as the boys who played ball and went fishing. When he was 22 he became manager of this same mill and ran it for many years. In the interim he had completed college before he was eighteen, had managed a general store for four years, had become the proprietor of a drug store which he still owns. Long ago he became a man of independent means.

* * *

Now the story of Frank Mondell is quite another sort of yarn. The Republicans have conferred upon Mr. Mondell their floor leadership on the House side, and that position, in the changed conditions that resulted from the overthrow of the Speaker a decade ago, and his consequent loss of power, is the most commanding at this end of the Capitol. When the appointment of committees was taken away from the Speaker he lost control of those committees. The authority went from the chair to the floor. In caucus each party chooses itself a steering committee and a floor leader who is chairman of that committee. This committee maps out the program and the leader drives it through. It is the top job. When the Republicans came into power two years ago, and the minority leadership became the majority leadership, Mondell, of Wyoming, suave, genial, diplomatic, eased his way into the place of power.

I asked Mr. Mondell how he got where he was, and he said that he did it by following his nose on a long and tortuous journey that wound up just here and by entering with genial enthusiasm into every task that presented itself along the way.

Even that gave no evidence of dramatic situations scattered through an eventful career. I don't believe anybody had ever taken the trouble to dig up the "story" that lay in this Congressional leader. Nobody in Congress, for instance, seemed to know that this blue-eyed, middle-sized, hawk-nosed, friendly floor leader still carries around with him the leaden bullet of a gunman of the West who sought to murder him. The story unwound itself in true movie fashion with Mr. Mondell, the mayor of Newcastle, Wyoming, attempting to rid that community of the stick-up men who infested it.

The town was full of saloons and gambling houses. When the hard times came with the silver slump in the nineties, those satellites of the dives found the pickings so poor that they were driven to robbery. There was a crime wave. The town administration surveyed the situation and decided that it would be well if a score or so of individuals with no visible means of support should move on. A list was made up and the men notified. They should be on their way not later than the midnight train on Friday.

Mr. Mondell came down the principal street that night. He was met by one of the men who had received notice.

"Does that order stand, Mr. Mayor," asked the man. "Do we have to go?"

"Yes," said Mondell. "Don't miss that midnight train."

Thereupon the undesirable whipped out his pistol and began shooting. One bullet entered the body of the mayor and ranged downward. It never came out. Another clipped his hat brim. Being unarmed, he dodged into a doorway.

There was a rough ten years back of Mr. Mondell's coming to Newcastle—ten years as a foreman of a construction gang in railroad building. He became a sort of top sergeant in that construction corps which, forty years ago, worked so busily at the task of laying into one wilderness after another those strips of steel which performed the miracle of its transformation. And all the time Foreman Mondell took pot luck and did man's work, little dreaming of the gang he would boss in 1921. They were running a line up into the Black Hill country in what is now South Dakota, when a difficulty intervened. It seemed that the railroad might be run no further because it was getting too far from a supply of coal that was of the quality required in engines. But for this difficulty it might reach out into Wyoming and Montana.

Frank Mondell's employer had noted that he had books on geology and was often reading them. So he said: "You ought to know more about how to find coal than any of the rest of us. Hitch up a four-mule team, take all the supplies you want, go over into Wyoming and don't come back until you have found it."

It took the gang boss a year and a half to complete his mission. At the end of that time he had what he wanted. He also had oil. His plans were made for getting these out of the ground and these plans contemplated the planting of a town. This town was Newcastle, Wyoming. Frank Mondell was its first citizen. He has been its first citizen ever since.

Fifty-four years ago an itinerant preacher stopped in a tiny town in eastern Iowa which was at that time just settling up. He read his Greek and Hebrew from the original and his box of books was bigger than his box of food. Yet he had added to himself a wife and family for he took the parable of the ravens quite literally. The preacher's attention was drawn to a boy of six, Frank Mondell, who then seemed to be unattached.

Inquiry developed the fact that the boy belonged to nobody in particular. He lived part of the time with a family on one side of the town and part of the time with another family on the other side. His journeyings were occasioned by this scheme of living around. No, he was not related to any of these people. He was only six years old. His name was Frank Mondell. The preacher, still trusting in the ravens, adopted Frank. Thus it happened that Frank Mondell found a foster father and journeyed to the lake country in northwest Iowa, where he lived for eleven years of his boyhood. There was no mystery as to the origin of Frank Mondell. His father, a French Huguenot, who spelled his name "Mondelle," had come to the Upper Mississippi from New England about 1840. He had kept a frontier hotel at Prairie du Chien, in Wisconsin, had later drifted down to St. Louis, where Frank was born. He fought as a captain in the Civil War and came home to find that cholera had taken off his wife and eldest daughter. He married again and brought his new wife to mother his brood of eight children. Almost immediately he died. The stepmother took Frank to relatives in the Iowa village, where she soon afterward died. From that time on Frank Mondell was compelled to shift for himself.

A twenty-acre pecan grove on a plantation in Mississippi, showing the sturdy, symmetrical appearance of the trees.

Domesticating the Pecan

By C. E. COLLINS

WHEN you buy that sack of mixed nuts to slip into the kiddie's stocking for a Christmas morning feast, or when you take the sweetest girl in the world a box of candy with pieces studded with bits of nuts, or when you get these bits on a nut sundae at the corner soda fountain, it is nine chances out of ten that you are contributing your bit to domesticate the pecan.

Just as the potato, the tomato, and many other staple articles of food on the table of the average American family were developed into a useful and domestic existence after centuries of wild life, just so is the pecan being rescued from the fast disappearing forest to serve a future and useful purpose to mankind.

To indicate just how fast it is being transplanted from the wild to the domestic grove, it is reliably estimated that 95 per cent of the developed pecan trees in the country today have been set out in the last ten years. Of course there are thousands, perhaps millions of wild trees still standing, but they are undeveloped seedlings scattered through big forests whose only good probably will be when the axman comes along and smilingly chops it down with the inward thought that some hardwood lumber buyer will be fooled into thinking it is hickory instead of pecan.

The pecan is a native of the southern states and, generally speaking, will succeed where cotton can be grown, but it is more common in the immediate lower Mississippi Valley than elsewhere in the United States. It thrives well in the deep rich soil of river valleys, such as the fertile lands bordering the lower Mississippi. However, the last generation of southern farmers has learned that it will grow elsewhere with proper and careful attention. Domesticated pecan groves, consequently, are dotting the landscape where the white-bolled cotton stalk has held sway for many, many years.

Some of the pioneer pecan growers of the southern states have large groves of pecan trees just as northern farmers have orchards of apples and peaches. Most of the groves still are very young and are just beginning to reach maturity in production, and there are hundreds of new groves being set out since the possibilities of immense profit from them have been demonstrated.

Southern farmers are learning some very interesting and, withal, some very profitable lessons from the humble pecan. They are learning now because, before the pecan took up a domesticated existence, little was known of it. In fact there still is a deal of mystery as to how long a pecan tree will live and how long it will bear. Wild pecan trees known to be more than 100 years old seem to keep on growing and bearing rich harvests of nuts from year to year. They will stand more rough usage, such as windstorms and lightning bolts, than most trees; they are very seldom uprooted and have a very dignified and symmetrical appearance.

The demand for domesticated pecan trees has led to the establishment in recent years of pecan nurseries in the southern states. Grafting and budding of trees has greatly improved the stock, just as grafting and budding has brought great improvement in the developed peach over the seedling peach.

After its eighth or tenth year, the pecan tree begins to bear a profitable crop, and it is a poor grove indeed that, when 15 years old, will not yield $100 clear profit an acre.

In a recent investigation in Mississippi and adjoining states, E. F. White, extension horticulturist representing the United States Department of Agriculture, and the Mississippi Agricultural and Mechanical College, brought to light some remarkable instances of the huge profits possible from pecan trees, as well as much interesting information from the pioneer growers of domesticated pecans.

He reported that the grove of V. L. Beyer, at Wiggins, Mississippi, produced a profit in one year of $1,250 per acre. Rev. R. E. Hall, of Hattiesburg, Mississippi, obtained a profit of $600 per acre; R. W. Bruce, Hermanville, Mississippi, $500 an acre; I. E. Bass & Sons, Lumberton, Mississippi, $528 and C. E. Pabst, of Ocean Springs, Mississippi, one of the pioneers in developing the pecan and the originator of Pabst variety, $460 per acre.

There is a ready market for pecans at from 40 cents to $1 per pound, depending upon size and quality of nuts. In his investigation, Mr. White found single pecan trees that, had the full crop been marketed at an average price, would have brought their owners an average of more than $1 a day for each day in the year. J. R. Oliver, of St. Martinville, Louisiana, received nine barrels or 1,350 pounds of nuts from a seedling tree on his property. Judge J. L. Buckley, of Enterprise, Mississippi, reported a yield of 1,200 pounds from a single seedling and other big yields were disclosed.

The budded and grafted trees are much younger than most of the bearing seedlings because budding and grafting is a recent development but some very profitable yields from developed trees were found by Mr. White. A four-year-old tree at Vancleave, Mississippi, produced 60 pounds of nuts; a seven-year-old tree at Lumberton, Mississippi, yielded 149 pounds and a 13-year-old tree at Ocean Springs, Mississippi, produced 185 pounds.

An eight-year-old grove of trees owned by D. C. Bramlette, Jr., of Woodville, Mississippi, produced a profit of $50 an acre; J. B. Wight, of Cairo, Georgia, had a $75 profit per acre from a grove also eight years old; the estate of Dunbar Hunt, near Rodney, Mississippi, has a grove of 20 acres of eighteen-year-old trees that in one season produced a net profit of $2,800.

Following up his investigations, Mr. White said that his findings indicated that pecan trees should be planted in well-prepared, well-drained land. "Cover crops" or companion crops such as peas, beans, peanuts, sweet and Irish potatoes, melons, strawberries, cucumbers, and cotton between the tree rows can be planted and cultivated successfully while the trees are maturing, thus preventing loss of use of the land until the grove is in bearing. Trees should be pruned until 10 years old and sprayed whether bearing or not, and fertilizer and mulch will increase yields in every instance, Mr. White's investigations disclosed. He recommended that trees be planted in "checks" 60 by 60 feet, with even a wider distance between if the soil is rich and deep. In transplanting, it is imperative, he says, that the roots be kept constantly moist.

One gets an idea of the newness and the "experimental stage" of pecan culture as a commercial industry from Mr. White's report which says, "Very little is known of fertility and sterility of the different varieties of pecans, but the majority believe that they are self-fertile."

Also one is given the impression of a great future in the growing of pecans when Mr. White remarks that "Growers are unanimous in the belief that the future production of pecan nuts is 'very favorable,' 'unusually bright,' and 'cannot be overdone.'" To their statements might be added the passage in a government bulletin dealing with the pecan. "If pecan culture is pushed with the usual skill and energy of American enterprise, there is every reason to believe that it will not be many years before the pecan will become not only abundant on our markets but also of great importance as an export product."

The pecan harvest starts about the middle of October and usually ends about the middle of December. When the nuts are "ripe" the burr about them opens and they fall to the ground. In the larger commercial orchards or groves, the harvesting is accomplished by using long bamboo poles similar to "fishing poles" for knocking the nuts to the ground. Eventually the trees in the young commercial orchards will be so tall that harvesting will be more difficult, as it is in gathering nuts from the wild seedling trees which often are found towering 150 feet in the air. It is necessary to climb such trees and use the long poles to knock off the nuts, else wait until they fall.

Some of the commercial grove owners have adopted crude methods of polishing the nuts before they market them. One method is to use a barrel partly filled with sand and placed on spindles so that it can be revolved rapidly, the sand polishing the hard surface of the nuts as they are whirled about.

Grading the nuts according to size is another development that is coming into common usage, the larger and more choice nuts bringing a premium when offered for sale. A New Orleans concern which has built up a large business in pecans, uses the common sifter method by which the small nuts drop through holes in a rotating or oscillating bin.

Pecan cracking and picking factories are springing up here and there in the pecan growing region. In these the nuts are cracked and the meats removed. Usually the nuts are soaked in water to prevent injury to the meat during the cracking process, and the meat is more easily removed whole.

There is a large and constantly growing market for the unbroken meats to lovers of nuts, the meats being very delicious as well as nutritious when eaten with salt. Candy-makers and confectioners buy most of the meats, both whole and broken, using the whole meats in the finer candies and the broken bits for nut sundaes, nougats, and so on.

The agricultural experts in the southern states are giving pecan culture a great deal of attention and undoubtedly will give it more as the number of commercial groves increases. They are urging not only the farmers to grow the improved trees, but home owners in the villages, towns and cities are being told that the pecan is an ideal lawn tree, because it fills all the requirements for such trees and, moreover, "will pay the tax and insurance on a very nice home" with the nuts it produces.

LEWIS EINSTEIN

(C) Harris & Ewing

Within the Sacred Precincts of Diplomacy

The Case of Mr. Lewis Einstein

By GEORGE A. SCHREINER

THOUGH the case of Mr. Lewis Einstein is a remarkable one, it should not be assumed that it stands isolated in the history of diplomacy. After all, it is true that there is nothing new under the sun. Things are novel merely because succeeding generations learn of them, forget them again, and take pains not to profit by example. This applies especially to diplomacy.

Years ago, Mr. Einstein had been accredited by the United States Government to a small government in Latin-America as minister plenipotentiary. During the first part of the Wilson administration he had been stationed in Constantinople, but had left *persona non grata*. That is to say: He was no longer wanted by the Ottoman Government. The situation was expressed in as many words at the time. The State Department knew that perfectly well, because the reason was on record.

Great was the impression created when Mr. Einstein reappeared in Turkey early in the spring of 1915. The newspaperman was at the Dardanelles at the time. Though the officers of the batteries had more to do than speculate on the vanities of diplomacy, they made the entrance of Mr. Einstein the topic of many a mess conversation.

The Sublime Porte stared in surprise when Mr. Morgenthau suggested that Mr. Einstein be extended the usual diplomatic courtesies. Enver Pasha, Talaat Bey, and the grand vizier would not listen to any such proposition, and informed Mr. Morgenthau that it would be best to send Mr. Einstein whither he had come, to wit: Paris and London.

Mr. Morgenthau was not disinclined at first to do that. It was not plain to him just what sphere the new arrival was to fill. The embassy had a *conseiller,* and the requisite number of secretaries, reinforced by Captain R. H. Williams, United States Coast Artillery, now colonel on the general staff, who, in addition to having an undefined status as military attaché, attended to all the relief work that was being done at the time. Though the embassy was rather busy with all the people it had in its care, it cannot be said that anybody but the clerks worked himself to death. There was nothing to do for Mr. Einsetin, and Mr. Morgenthau concluded, and the intruder promoted that impression diligently, that he was there largely to give good advice.

The embassy staff also objected to the presence of the "diplomatic agent," as Mr. Einstein was listed. None of this helped. Mr. Einstein installed himself in a little room above the stairs in the embassy chancery and waited for better times, as it seemed. That room was mostly locked at first. But each day the agent was a member of the male tea Mr. Morgenthau was in the habit of giving.

Mr. Einstein greeted the newspaperman heartily when he returned from the Dardanelles. But nothing came of the effusiveness. The next that happened was that the newspaperman was invited to the male tea, present among others being: The ambassador, Mr. Shamavonian, the first dragoman, and Mr. Antonian, another dragoman.

After a sip of tea, Mr. Einstein opened fire. What, exactly, was the state of affairs on the Dardanelles? How many batteries, new emplacements, guns, shells; what had been the effect of the big bombardment of March 18; in what state of morale were the Turkish gunners; to what extent were they commanded by Germans; was anything known of the torpedo batteries at Kilid-il-Bahr; in what shape was the mine field and how extensive was it; what were the means of observation of the Turks; just where could the famous howitzer batteries be found, how were they moved about? As fine a line of vital military information as could be set out!

Evasive answers and negatives being all that came Mr. Einstein's way, the duties of citizenship of the newspaperman were referred to. The reply was that the newspaperman had many other duties, that is, he could not make himself impossible with the Turks in the interest of the news service which he represented, nor could he run the personal risk, since he stood under Ottoman military law; lastly, he was not in the habit of abusing the confidence of those whose guest he was. The newspaperman stated that all he was permitted to say had gone through the hands of the censors, and was known in the embassy.

Mr. Einstein was not satisfied with that. The embassy had a right to know. Were it not that a tea, even among men, is supposed to be a polite affair, hard words might have been passed back and forth ere long. Anyway, enough had been learned.

So far not a single American on the Bosphorus had been molested by the Turkish Government. Very soon it was to be different. A British submarine sneaked into the port of Constantinople and under the very nose of the Sublime Porte blew up, in broad daylight, a coal barge moored at a quay in Haider Pasha. That settled it. The Turkish Government ordered a search of all houses at Robert College, at Arnautkoi, and wherever Americans lived. But nothing suspicious was found.

The Alibabi would have liked to get into the American embassy, and especially into Mr. Einstein's room, but that would have been equivalent to a declaration of war. It was to be the turn of the United States small cruiser, "Scorpion," the American *stationaire* in the port. The cruiser had been tied to the wharf below Top Haneh, and none had even dared to imply that Captain J. P. Morton had dealings with the enemies of Turkey. In fact, that was never stated, but the port authorities insisted that the "Scorpion" station herself henceforth between the old and new bridges across the Golden Horn. It was the safety of the cruiser that was in the mind of the authority, as it was put. The actual reason was another, though an entirely unfounded one. Captain Morton had always been what a naval officer of a friendly nation ought to be—courteous, correct and most tactful.

Meanwhile, Mr. Lansing had been asked to please take Mr. Einstein away. But the Secretary of State remained mute. The agent's attitude was one of *J'y suis, J'y reste,* and he did not budge. But there is an end to all things. Ultimately, Mr. Einstein left for parts unknown, to wit: Paris and London.

There were many persons in Constantinople at that time who were not especially fond of the Turk and his rule. Mr. Einstein made the tactical mistake of consorting with them more than a tactful diplomatist would have done, and the good men and women of non-Turk origin did their best to have it known that they were in the swim with the American diplomatic agent. The hopes of the Greeks and Armenians were personified in Mr. Einstein, and when the *Agence Tatavla* had a particularly pleasant rumor, the name of the agent was associated with it. In the cafés it was whispered that within a few days the British and French would be in the city, and Mr. Einstein was quoted as the author of the tale. When Mr. Einstein was gone none was happier than the regular staff of the embassy—from ambassador down to the least *cavass.*

In the course of time, the newspaperman went to Sofia to attend a further widening of the war. It had become known to him that the Bulgarians were about to join the Central Powers.

In the Bulgarian capital the following interesting

(C) Int. Film Service

A-GENERAL VIEW OF CONSTANTINOPLE

The possession of this city has long been a bone of contention. Many European statesmen have wanted to drive out the Turk bag and baggage, but there have always been interests to interfere.

state of affairs was found. Dr. Acene Kermecktchieff had lost his job as consular agent, because he belonged to the Bulgarian party that was for joining the Central Powers. The doctor is a writer, and since in that year he made something like two dollars, as consular agent, he had to do something besides, of course. He wrote a political article for the *Narodnai Prava,* the paper of Dr. Radoslavoff, then premier of Bulgaria, and was promptly removed from office by Mr. Lansing.

In his stead now served Mr. Dominic I. Murphy, as consul general. Mr. Murphy had been in the consular service of the United States since the Cleveland administration and had really made a mark in it. In the course of time, he had been stationed at Bordeaux, Amsterdam, and London, as consul and consul general.

The Bulgarian Government appreciated the consideration shown it by having an American consul general. Though it had sent to Washington Dr. Stephen Panaretoff, accredited as minister, that courtesy had not been regularly reciprocated so far. Mr. Charles Vopicka, the United States minister at Bucharest was also accredited to the Bulgarian and Serbian governments, a partition of honors which the men in Sofia enjoyed but very little, especially since they were at war with Serbia and faced the prospect of conflict with Rumania. The arrival of Mr. Murphy marked an epoch in diplomatic history, therefore. The new consul general had been given certain diplomatic powers and functions by the State Department.

All seemed well. The semi-official *Echo de Bulgarie* came out with a column of welcome, literally dripping with joy and the assurances that relations between the great republic in the West and the little kingdom in the Balkan had never been better. For a country committed to war by an understanding concerning a border rectification along the Maritza—at the expense of the Turks, naturally—that meant a great deal.

But the joy was short-lived. Mr. Einstein arrived —in short blue jacket, cricket pants and with lawn-tennis racket under his arm. He put up at the Grand Hotel Bulgarie, and paid his respects to the foreign office on the following day.

After all, the appointment of a minister at a capital hitherto not on the State Department register was some story. The newspaperman thought so, and interviewed Mr. Einstein, who, to be brief about it, distributed a card neatly engraved in French, reading: M. Lewis Einstein—*Ministre Plénipotentiaire.*

The legend on the *carte de visite* being plain and definite, the newspaperman wrote a short item for the cable. Again the *Écho de Bulgarie* burst forth in paeans of the United States, but said nothing of Mr. Einstein's status.

A few days later it was learned that Mr. Einstein was minister only on his visiting card. Otherwise he was just a plain 'diplomatic agent' with privileges to establish and maintain in Sofia something resembling a "legation." Since Bulgaria entered the war about that time, the newspaperman did not deem it worth while to send a correction. Owners of scrapbooks are requested to pay attention to this.

The State Department did not seem to know at first that Mr. Einstein was in Sofia. When last heard of, this diplomatic rover had been in Paris and London, and now he was in Sofia. Just about the time that this was learned, Messrs. Murphy and Einstein had a mutual explanation on the second floor of the hotel—in the "legation"—that was a beauty, and just about that time, also, diplomatic privileges were withdrawn from the "legation." Thereafter, Mr. Einstein had to do what Dr. Dumba did in Washington—submit all telegrams in *texte clair,* so that all could read them, and take the chances of censorship with his mail.

A number of incidents contributed to that. One fine day, the pseudo-minister showed up in Philippople to inspect the prison camp in which the English and French taken on the Golash mountain were confined. The commander of the camp asked Mr. Einstein for his credentials. The agent did not need such a thing, he said. He was above the law of Bulgaria. The commander could not see it that way, telegraphed to Sofia, and was instructed to return Mr. Einstein hale and hearty. Upon his return, Mr. Einstein found a wonderful chance for a diplomatic incident awaiting him. The French were holding in detention, aboard a battleship at Marseilles, the diplomatists of Bulgaria who had been stationed at London and Paris. Such detention being against international law, the Bulgarian Government decided to pry them loose by reprisal.

The British had left in charge of their legation at Sofia a Mr. Hirst, officially recognized as the 'custodian of archives.' It was decided to incarcerate this man until the French should have released the Bulgarian diplomatists.

But Messrs. Einstein and Hirst played lawn-tennis together every fair afternoon. Mr. Hirst learned of his intended arrest and fled to the American "legation."

When the Bulgarian police arrived at the legation, Mr. Einstein was prepared for them. He announced that Mr. Hirst was in diplomatic asylum and that difficulties with the government of the United States would ensue in case the attempt was made to take the refugee. The officer of the squad thought that over for a while, and decided to depart in search of counsel and further instructions.

M. Kozeff, the state secretary for foreign affairs, implored Mr. Einstein to be reasonable, but the agent held his ground. The refugee could be taken away only over his dead body, and that was all there was to it.

The next step of the Bulgarian Government consisted of placing a guard in the corridor that led to the "legation." That diplomatic residence, by the way, consisted of a small parlor and a bed room, with privilege to use the public bath room *across* the corridor. Out of the fact that the bath room was not connected with the "legation" arose one of the strangest diplomatic situations in the history of the world.

Above the door of the Einstein rooms in the hotel had been fastened the escutcheon of the State Department, the intent of this being that all that lay beyond had to be regarded as territory of the United States.

(C) Press Ill. Service

Above—Constantinople—the proud city of the East. It would seem that America might be forced to play guardian for the fragment of Turkey and especially safeguard the Bosphorous.

Below—Sailors on leave in Constantinople. Our American sailors out on a sight-seeing tour. Passing one of the famous Mosques.

The principle of exterritoriality figures out that way. Within the borders described by the walls of the room, and as designated by the escutcheon, Uncle Sam had all the rights he had in Washington, D. C., itself. The Bulgarians began to see that and hoped that Mr. Hirst would leave the rooms, in which case they would pounce upon him and carry him to jail.

That evening, Mr. Einstein ordered supper for two. Diplomatist and refugee spent a quiet evening home. Breakfast, also, was enjoyed in the same manner. But when luncheon time came, the hotel manager informed Mr. Einstein that he had received orders from the Royal Bulgarian Government to serve only *one* meal in the "legation."

Mr. Einstein thought that over for just a second, and ordered *one* luncheon. That luncheon was served, and when it had been eaten by the refugee, Mr. Einstein repaired into the public dining room and ate *his* luncheon. The same performance took place at dinner.

Next morning the diplomatist was informed by the manager of the hotel that henceforth no meals could be served in the "legation" by *ukase* of the Royal Bulgarian Government, though the agent would be welcome to have *his* breakfast in the dining room.

On the same day, Mr. Einstein was served a notice of eviction. The aspects of the case, under international law, began to assume the gravest colors, as they put it in diplomatic language. The agent retorted to the effect that he could not be evicted, so long as he paid the rent. The hotel manager pleaded that the very same rooms had for some time been reserved by a man from Remi, and that they would have to be given up. Mr. Einstein could have other quarters in the hotel.

Diplomatist and refugee stuck their heads together and delved into the *political aspect* of moving into another set of rooms. The intent of the authorities was plain. While moving, the person of the custodian of archives would be seized, and as yet it was not clear how the principle of safe-conduct could be applied. At any rate it was better to keep the "legation" where it was.

Man needs a bath once in a while, of course, and to the military, police, and diplomatic forces of the Royal Bulgarian Government was now added the chamber maid. She refused to carry so much water out of the apartment. With the chamber maid having gone over to the side of the enemy, there was a problem of some proportions. Mr. Einstein had patiently bought food for his guest in town, but chambermaiding proved a little too much for him.

He attempted the forming of another *modus vivendi.* The irate and Royal Bulgarian Government said him nay. Long and delicate diplomatic negotiations ensued. The American diplomatic agent insisted that the bath room was exterritorial, because *he* had to use it. At first the foreign office controverted this point, but finally surrendered. According to international law the payment of rent for the "legation" included the use of the public bath room. There was no getting away from that, though precedents could not be found. Again Mr. Einstein scored one.

But to get into that bath room the public corridor had to be crossed. The solution of the problem was therefore incomplete. Mr. Einstein next set up the principle that, exterritorially speaking, a certain part of that corridor was also exterritorial. The foreign office replied that this was not so. Granting that claim, diplomatists might in the future assert that the Bulgarian railroads were exterritorial, or any street, any building in fact, of which a diplomatist might care to take possession. The recognition of that principle might have grave consequences in the future; it was with regret, therefore, that the Royal Bulgarian Government informed the diplomatic agent of the United States Government that his claim could not be allowed.

There was no way out, but to apply the principle of safe-conduct. Negotiations had progressed slowly, and although not sure of his ground, but driven by desperation, Mr. Einstein served notice upon the guards in the corridor that he would lead the refugee to the bath, and woe betide the Royal Bulgarian Government if one of its minions molested either him or the man. It was good luck that the officer of police did not know as much of international law as did Mr. Kozeff. Mr. Hirst made his ablutions and returned to the "legation," to await developments.

Meanwhile, the plight of the custodian of archives had become known in Washington and London. Mr. Lansing supported Mr. Einstein with might and main—until he began to look a little deeper into the international crisis in which the country was being involved. Thereupon he sent a telegram to Sofia—in clear text—in which he recommended to Mr. Einstein that he put an end to the diplomatic negotiations by surrendering the refugee. The telegram was submitted to the scrutiny of the newspaperman in the foreign office. It was politely couched, but Mr. Einstein paid no attention to it.

Untimately, it was the good sense of the British Government that put a period to this strange chapter in international relations. The Bulgarian diplomatists were released, and with that expired the warrant against Mr. Hirst.

This critical situation had hardly passed when Mr. Einstein was again in the toils of a diplomatic complication.

There had been attached to the American legation at Bucharest a young man, as secretary, whose name does not matter, because the newspaperman established that he had no evil intent. With the war booming business in Rumania, the secretary had decided to engage in business. He intended going to Saloniki.

He had no difficulty getting into Bulgaria via Rustchuck. Bad fortune attended him when he tried to get out. The young chap made several cardinal mistakes. One of them was that he obtained a visé from Mr. Einstein, the second, consisting of his making application for a travel permit to Saloniki with the Einstein-visé passport in his hands. That travel permit was refused.

Being resourceful, the chap went about it in another way. To an inspector of passports and travel permits at the railroad station of Sofia, he offered a little present in dollars in case said inspector would alter the travel permit he had secured, or change it. The inspector entered into the trade. The American took the proscribed train for Demotika and Saloniki.

Two stations beyond the capital several gendarmes entered the car and arrested him, taking from him all papers in his possession. For several weeks the young man languished in a Sofia jail. The trial established his innocence, despite the fact that he had in his possession, at the time of arrest, a cryptogrammic letter in Mr. Einstein's handwriting. The diplomatic agent of the United States could not deny that it was his letter. And the American admitted that the agent had given it to him.

By now the Royal Bulgarian Government was willing to do anything to be at peace with the United States. It was not until the newspaperman had forwarded to New York a detailed account of the diplomatic enterprise of Mr. Einstein that action was taken by the Department of State. The diplomatic agent was recalled from his post, lingered a while in London and Paris and was then excused from serving longer.

The West Point of Today: Our War School

Concluded from page 6

hearted gayety which the boys exhibit in boxing and wrestling bouts, a turn with the foils or sabers in the spacious fencing room; their frolics in the big swimming tank. On the afternoon of my visit, a match game of basketball was on with a Wesleyan college team and "The Army" won by a very close margin. There was some tall old rooting on both sides; but that *esprit de corps* which is more or less a tradition of every college is with the West Pointers something more—it is a matter of profound religion.

There is no such wonderful team-play in all the world as that which West Point knows. The cadet, from the moment of his entry until his graduation, is imbued at every turn with a sense of loyalty to his alma mater as inevitably expressing itself in a sort of masonic fellowship with comrades of the corps that amounts to a sort of deep spiritual communion. He feels himself one with not only contemporary but past and future West Pointers.

This solidarity is, of course, intensified and fostered by the very conditions of close communal daily living that would otherwise be more than irksome to the free and roving spirit of youth—especially American youth. Through his first year the cadet is restricted at every turn. The "bounds" within which he must remain are straitly and narrowly prescribed. My nice boy had to obtain s p e c i a l permission to meet me at the station that Saturday afternoon, and permission a second time to take dinner with me at the single ancient hotel permitted within the Academy grounds. A familiar jest of boys and visitors is that it is this hotel, that the hand of the Father of His Country, in the fine equestrian statue that faces the approach, is raised against in solemn warning.

Only after achieving the probation period of the plebe year is the cadet admitted to the Cadets' Club, or to a class dance. That obedience is the first duty of a soldier and that he who would command must first learn to obey is rubbed in without mercy. He has to learn to take a back seat gracefully. All of which, of course, heightens immensely the value in his eyes of the reward that comes to him in his second year in the way of liberties, privileges and immunities that other college students consider matter of course.

Military efficiency is the great aim and object of the academy's training; but even military efficiency is subordinated to *honor*. "Duty, Honor, Country," the proud motto of West Point, is no empty phrase. To do the thing just because it is right becomes second nature, as it is ingrained in the spirit. A cadet is made to feel that he is the inheritor of a stainless tradition of truthfulness and that it is his sacred trust and privilege, individually and in cooperation with his comrades, to jealously guard its purity. Absolute honesty in speech and manner is at all times mandatory and the slightest infraction means immediate separation from the academy.

The one thing in West Point which might well be emulated by every educational institution in America is this stress on character and efficiency. Yet these things are instilled without the least slight to the cadet's sense of self-repect. Duty has for him a profound meaning, which, alas, is uncommon among other youngsters of our modern age. He is under strict discipline and is held to obedience to orders, rules and regulations. At the same time, his self-reliance is developed and strengthened all along the line.

Passing around the back of one of the dormitories, I was struck by the strange spectacle of some half-dozen cadets in undress uniform pacing with measured strides but rapidly up and down and around a space marked off with chalk lines. The young nephew that but yesteryear, it seemed, was playing with tin soldiers on the nursery rug, told me that they were cadets doing "punishment." One had left his fatigue jacket lying across a chair instead of hanging it up in the wardrobe when he changed to a dress coat. Another had been five minutes late at assembly that morning. A third had "almost" passed an officer without saluting, or funked in a recitation. According to the gravity of the offense, the boy must pace the twenty-foot square a certain number of times, keeping within its lines and "incommunicado." At the end of every tenth circuit, however, he may be free for five minutes. My boy's much-loved chum was among the penitents. He waved a hand, but was not allowed to speak. We passed around to the front of the building and just then this chum's father and mother drove up in a big touring car from New York to have him to dinner at the post hotel and stay over Sunday, as was their weekly custom. They welcomed their son's chum cordially, and me for his sake. But the dear mother drew a long face when told why her hopeful could not come to her just then. "My son in disgrace," she exclaimed tragically. Just then he came running up and was clasped in the maternal embrace. He smiled a little red-facedly at his mother's woe, assuring her that the "punishment" he was undergoing was not considered a bit disgraceful, but on the contrary just a bit of soldierly discipline without which no West Point education would be complete. Loyally, his chum piped up that "there must be something wrong with a boy who does not come in for 'punishment' once in a while." This comforted the good mother when at the end of five minutes, her son had to rush away to complete his stint, especially as he kissed her affectionately before escaping and promised to come right back.

We all dined at the hotel that evening and it was a good dinner, despite Washington's warning gesture. As, in the interim, we rambled about the grounds inspecting at Trophy Point the big guns and the segment of chain that with a boom of logs was placed across the river between West Point and Constitution Island to obstruct the navigation of the river by the British during the Revolutionary War, the boy in gray discoursed earnestly on the historical associations of the place and of plans for the future. Many of the lessons of the World War will be put into play, he said, especially in the field of artillery. An aviation school is planned and a department of chemical warfare!

Above—Gothic tower of gray stone at entrance to the grounds of the Military Academy and flanking the riding school.

Below—Interior of riding academy, the largest in the world, ranking next to that of the French Military school at Saint Cyr.

I listened respectfully, as behooves an ancient uncle in the presence of the coming generation. Here was this dear, sweet boy—this nice clean youngster with high-minded aspirations and sound-hearted affections—his mother's darling—discussing aerial navies dripping blood, blockaded and starved populations over half the globe, high-explosive bombs scattering death and frightful mutilation in the trenches and on country roads, "Big Berthas" dealing slaughter and havoc in city populations from hidden points a hundred or two hundred miles away, the frightfulness of poison-gas barrages—and all this with the most matter-of-fact insouciance! "Chemical warfare!"

I could not help recalling Bulwer-Lytton's fanciful story, "The Coming Race." You remember, it is the narrative of a wonderful people in the earth's interior who had progressed far beyond the denizens of earth's outer crust in all the arts of civilization. Among other things, they had abolished war; that is, save for an occasional brush with remnants of wild savage tribes on the far frontiers. When it became necessary on account of these invasions, to resort again to the obsolete art of the warrior, the task was intrusted to troops of children—just such dear and lovable youngsters as these West Point cadets, so nice to their mothers, so gentle and fine and so gay and happy in their gold-laced and gilt-buttoned gray uniforms—who went forth as to a great game armed with "vril-sticks," which they had only to wave at the advancing ranks of savages to cause them to fall back in terror and confusion, most of them falling dead in their tracks!

It must be noted that the influence of the lessons of the World War on West Point will prove to be much more than a matter of thickened callousness to weapons and methods which were once stigmatized as "barbarous Prussian frightfulness." In the last annual report of General Douglas MacArthur, whose assumption of command as superintendent of the military academy synchronized with the ending of that war, it is made plain that the present is regarded as marking a new epoch in the life of the institution and of military science. Considering the big problem as to whether a changed type of officer was necessary to produce the maximum of efficiency in the handling of men-at-arms, several very new developments had to be taken into account. With the termination of the World War, the mission of West Point became at once the preparation of officer personnel for the next possible future war. So in developing the traditional policy of the academy, full recognition was given to the great outstanding fact that, until the World War, conflicts between nations had been fought by a comparatively small fraction of the populations involved and that these professional armies were composed very largely of elements which frequently required the most rigid methods of training, the severest forms of discipline to weld them into a flexible weapon for use on the battlefield. Accordingly, officers were developed to handle a more or less recalcitrant element along "simple" lines and a fixed psychology resulted.

To the astonishment of the military chieftains on both sides in the World War it was realized with some astonishment that the professional armies on which they had relied were unable to bring the combat to a definite decision. It became evident that—due largely to the improvements in transportation and communication that had occurred in the past generation—national communities had become so intimate that war was a condition which involved the efforts of every man, woman and child in the countries affected. War had become a phenomenon which truly involved the nation in arms. Says General MacArthur:

> "Discipline no longer required extreme methods. Men generally needed only to be told what to do, rather than to be forced by fear of the consequence of failure. The great numbers involved made it impossible to apply the old rigid methods which had been so successful when battle lines were not so extensive. The rule of this last war cannot but apply to that of the future. Improvisation will be the watchword.

In accordance with these ideas, while holding, as of old, to *thoroughness* as to a lodestar, the functions of the academy have been broadened to give the cadet, in addition to that character building for which it has long been famous, and in addition to the necessary military and physical training, such a combination of basic general and technical education as will provide an adequate foundation for a cadet's subsequent career. To this end, certain studies are closely co-ordinated, such, for instance, as political and military history, economics and government, psychology and sociology. Well-arranged courses in French and Spanish as in English are provided. German, as well as Latin and Greek, are evidently crowded out by the attention given to mathematics, engineering and moral philosophy. Fitly enough, Rostand's "Cyrano de Bergerac" finds place in the prescribed reading in the French course. As to English, we are told that the aim of the work is to form habits of clear, concise and correct written expression; to stimulate interest in good reading, especially in the field of contemporary prose, and to give practice in oral expression. Should war be abolished before my young kinsman is ready to take the field, I am consoled by the thought that he will have been given a course of sprouts that should prepare him to become a good newspaperman.

It has sometimes been said that there should be not one but 100 West Points in the United States. The suggestion is made, on the one hand, by those inclined to militarism and believing in an extended scale of "preparedness," and, on the other, by practical educators who are convinced that West Point's traditions of honor and loyalty, its discipline and its efficiency, should have large part in any modern system of education. But there can never be more than one West Point. The historical associations of its very situation and the place in the national life it has filled for more than a century make it *sui generis*. The finest military school in the world, as it undoubtedly is now, its contribution to a future and greater civilization will not be in duplication of buildings and equipments, of curriculae at strategic points across the continent, but in the contributions that its experience will make to the solution of the great problem of combining democracy with discipline and individual leadership with efficient team-play, all to the enrichment and building up of human life, rather than its destruction.

Some prophecy of this far-off event may be found, perhaps, in the beautiful sonnet written in celebration of West Point's centennial by one of her distinguished sons, Dr. Edward S. Holden. It should be read and pondered in any attempt to understand West Point:

Here where resistlessly the river runs
Between majestic mountains to the sea
The Patriots' watch fires burned: their constancy
Won freedom as an heritage for their sons.
To keep that freedom pure, inviolate,
Here are the nation's children schooled in arts
Of Peace, in discipline of War; their hearts
Made resolute, their wills subordinate
To do their utmost duty at the call
Of this, their Country, whatso'er befall.
Broadcast upon our History's ample page
The record of their valiant deeds are strown
Proudly their Alma Mater claims her own.
May she have sons like these from age to age!

It's Spring—and He's "Cleaning" —the Movies

Veteran Reformer, at 71, Demands Clean Pictures for the American Theatergoers

By JOHN B. WALLACE

THE press has carried reports recently indicating that Dr. Wilbur F. Crafts, superintendent of the International Reform Bureau, was disposed to compromise with the producers in his fight for clean motion pictures. The other evening as Dr. Crafts was preparing to address a meeting held in Los Angeles, the capital of filmdom, I intimated that the report had spread around that because he had dined and conferred with several of the leading motion picture producers, he might be weakening.

The veteran reformer sniffed.

"Weakening, huh!" he exclaimed. "You listen to me tonight and see if you note any traces of weakening."

And when he had concluded his address to that immense audience, which included many of the leading producers of the world, I was forced to admit that if there were any traces of weakness or change of attitude since his conferences I had failed to detect them.

Dr. Crafts, despite his seventy-one years, is as full of energy as a spring colt. The matchless climate of Southern California has rejuvenated him to such an extent that he has decided to abandon Washington, leave Congress to its fate and settle down in Hollywood, there to beard the producer in his den.

Dr. Crafts is a born reformer but he is not of the type that rushes about the country calling names, antagonizing the friends of a cause and getting nowhere. Dr. Crafts plans a campaign, lays out an objective and then proceeds to work steadily toward that objective. He gets setbacks as do all reformers but he steadily, persistently works to his end until it is accomplished. Then he starts on something else. Today his main objective is to force the motion picture producers to clean house. He says that there is only one successful and satisfactory manner to accomplish this. That is by the establishment of a Federal Commission, along the lines of the Railroad Commission, to regulate motion pictures. This commission would consist of men of the caliber of college presidents who would be paid a good salary and who would be absolutely independent of both politics and producers.

This plan is being bitterly opposed at the present time by the majority of the motion picture producers, and Dr. Crafts says that he realizes that there is no hope of carrying it in the present Congress. Therefore, he plans to work for state, county and city censorship, for the closing of motion pictures on Sunday until such time as the producers of their own accord produce pictures that are fit to be shown on Sundays as well as on week days. This constant harrying of the producers, the infinite confusion into which the industry will be thrown by the varying standards of censorship of different communities, Dr. Crafts believes will eventually cause the producers themselves to favor a national commission by which definite lines will be laid down for the guidance and regulation of the industry.

(C) Harris & Ewing

REV. WILBUR F. CRAFTS

"The picture producers have asked for a truce," said Dr. Crafts. "They have promised to clean up. But with very few exceptions they have made no move to do so. Mr. Hampton and a few of his type are honestly trying to clean up. Mr. Lasky has formulated fourteen points for the guidance of his writers and directors which, if carried out in good faith, will be a great step in the right direction. But other studios are doing little or nothing. They are going ahead with the production of photo-dramas that out-Herod Herod. The motion picture industry seems to be afflicted with the same kind of men who killed the liquor traffic. They have put the dollar above the home, the Bible and the nation. Blinded by the golden flood that has poured into their coffers they fail to see that the hour of reckoning is at hand.

Dr. Crafts says that the mayor of any city has ample authority to stop the showing of a picture that offends the morals of the community, but that, owing to the rottenness of municipal politics, few mayors have the courage to do their duty.

"It was a Tammany mayor in New York who showed the way when he closed not one picture but all pictures until the producers, alarmed, got together among themselves and had the present board of review created ——a board which, by the way, is the biggest farce that was ever heard of—a bit of camouflage which was successful for a time but which is now the laughing stock of the country."

The thing that especially arouses Dr. Crafts's indignation is the bogey that a certain element has made of the so-called Sunday blue laws.

"There is no national Sunday closing law pending in Congress and this bureau does not contemplate the introduction of a bill for Sunday closing. It is all a bogey created by a certain element in this country that wishes to throw open wide the doors to a commercialized Sabbath. These elements, consisting mainly of the men who controlled the liquor business, have enlisted the support of the motion picture producers, the prize fighters, the tobacco men, the baseball promoters and are even trying to scare the automobile men into line by claiming that there is danger of the passage of a law stopping the running of automobiles on Sunday. This unholy alliance with total lack of a sense of humor is solemnly quoting the utterances of ministers of the Seventh Day Adventists, a sect that will join with any movement that would lead to the abolition of the Christian Sabbath.

"The object of the whole conspiracy which began last August is to create a Continental Sabbath instead of an American Sabbath. The American Sabbath is written in the laws of every state in the Union except California and the District of Columbia. They are trying to break down these laws as they are trying to break down the prohibition laws. And they are trying to break them down so that they can make money. They care nothing for the moral welfare of the nation. They care nothing for its spiritual welfare. Their god is Mammon. The three smartest, shrewdest peoples on earth are Scotchmen, Yankees and Jews. The Scotchmen and Yankees fortunately for the world have religion. With their brains industry and frugality it is hard to contemplate what might have happened if they had not the saving grace of a religious conscience.

"The liquor traffic was never defeated by total abstainers. A prohibition law could never be carried in a thousand years if it depended upon the votes of nondrinkers. But when the men who controlled the liquor business attempted to control the government of the nation then the people rebelled. Drinking men asked themselves, 'Are these men our masters?' The rottenness of our municipal politics became a stench in the nostrils of our citizens. The liquor men began to crack the whip in state politics, then they reached the nation. They invaded Congress. They thought they owned the nation. But pride goeth before a fall. The very men whom they had counted upon for support, the men who used their goods, went back on them.

"The men who are trying to commercialize Sunday are in the same case today and they will meet the same fate. American ideals are too firmly planted in the breasts of the citizens of this country to be torn out by the unholy hands of the men who have prostituted for the sake of gold every business, sport and institution into which they have been allowed to creep."

A Comparison in Relativity

With the Fourth Dimension as Comic Relief

By JAMES S. RYAN

JUST outside the boundary of infinity begin the suburbs of complete nothingness, so far as space is concerned. First of all, imagine a suburb of "nothing," and then go one better than that, and imagine it composed of vacant lots. Then—but the proposition is possible of conception only in the mind of a child. A child's mind contains no knowledge or wisdom, so it is obvious that it has much more room for gigantic voids. The very young are very rich, if they only knew it, being mentally possessed of all the nothingness there is.

Now, if the reader's mind could be emptied for the moment, it might be possbile for him to conjure up something approaching a suitable stage setting for the following little sketch:

DRAMATIS PERSONAE

The Great Gazamgazumgaroooooooooo (ceaseless ciphers suggesting size).

His Little Son.

SCENE: Nothingness, "and then some," on the minus side, beyond the outer ether. The child is seated on the father's knee. To amuse his offspring the father wiggles his knee, and the child laughs. Each wiggle describes an arc of fifteen billion miles; and into the cavity of the child's laugh could be placed hundreds of millions of bodies each one as large as our own sun. If you "get that" (scientific language apart) you are on the way to think big things. I hate to be instructing you along like this because you seem a decent sort of scout.

FATHER: Now, my little boy (a teeny weeny little chap only about a hundred billion miles tall) I think it is time to begin letting you into the secrets of geology. (*He reaches down and picks up from the ground a small fragment of adamant comprising seventy or eighty of our ordinary domestic solar systems.*) Do you see that? You would think it a solid body, wouldn't you?

SON: Yes, popooooooooooo (ciphers used to avoid reproducing the voice here which, though only a child's voice, would reduce this earth and several of our esteemed neighboring bodies to imperceptible dust).

FATHER: Then look through this (*over the specimen in his hand he places a microscope made of a combination of ether tremors and cosmic clarity, fused by a sigh and chilled to hardness by a cold stare of insolent egoism*).

SON: Golly, Father (excuse the boy's ignorance of outer-space technical language) there's pores in it! (While in the excusing mood extend a little to his grammar also.)

FATHER: Yes, and in that apparently inert fragment there is continual atomic movement.

SON: How do you account for that, father? It seems impossible.

FATHER: This solid mass we stand on is an aggregation of molecules, each one a universe. Here on the outside of this great body there is no space, but there is time; it is a great blessing to have plenty of time and we have time to burn.

We lost our space long, long ago when the great blizzard of Milky Ways killed off all the young sprouts. And we should lose Time, too, if by any unlucky chance some neighboring nothingness were to poke its nose into ours. Then there would be such a cataclysm of epochs that lunch hour today might be hurled away to bedtime a hundred million years hence; a fragment wrenched from the end of a year might be thrown with such force as to reduce the next century to a handful of crumbled seconds, and some insignificant five minutes going about its ordinary business suddenly find itself flattened out into a million years of thin time; *NOW* would be *THEN, WHEN* would be *YET!* How would you like all in an instant to discover that, as you sit here, it is a thousand years before you were born? Whiz! Whiz! Whiz! Whiz! the present century doing a home-run; and out of the terrible vortex finally would come *NEVER*—a sad state in which we would find that we never were, and never could be. It is very difficult to place the mind on time—it slides off; but I am working on that now, having a theory—

SON: Father, you are raving!

FATHER: Well, even if I am, it often happens that the raving of today is the wisdom of tomorrow.

CURTAIN

(Furnished by the spinnings of our own planets.)

Briefly Told

To save the life of a penniless boy who was hurled into a small lake from the top of a coach on a speeding train, the Olympian, famous train of the Milwaukee Railroad, took a siding while the engine returned to pick up the boy who was found badly bruised and unable to walk. He was taken to the railroad hospital at Lind, Washington, where it is said he will recover.

Depletion of wild game in Northern Quebec, due to the introduction of the modern long range rifle, is forcing Eskimos and Indians into cannibalism, according to missionaries who have recently returned from that region.

The United States Department of Agriculture is equipping a steamship to use as a practical laboratory in which to study the shipping of citrous fruits and apples from the Pacific coast to eastern markets by way of the Panama Canal. Cargo space will be divided into compartments having various conditions of temperature, humidity and ventilation.

The Paris Municipal Council is considering a measure providing for an underground endless moving pavement, three miles in length, to relieve traffic on the boulevards.

The Louvain Library is to be reconstructed and the project has been decided on as a war memorial. The great libraries of the Allies are contributing large numbers of valuable volumes to the Louvain collection.

A recent ruling of the Kansas court of industrial relations provides that women who perform men's work are entitled to the same wages as men.

Eighty-two per cent of the people who died or were injured by fire in this country last year were mothers and children under school age.

The farmers own and operate half of the automobiles and trucks in the United States, the total of which is more than nine million.

The members of the Worcester, Massachusetts, Interdenominational Ministers' Association have agreed to refuse to solemnize the marriage of any couple whom they deem unfit for its sacred responsibilities, and to refuse remarriage to the guilty party in divorce proceedings.

Despite diking and channeling, the Hoang River of China has, in one thousand years, drowned more human beings than have been killed in all the wars of the same time. The only preventive of floods is in the reforestation of the denuded slopes which border the river valley.

A Chicago judge recently sentenced two alleged pickpockets to attend church regularly for six consecutive months.

Fake pearls, to the amount of nearly a million dollars' worth, have been imported by London jewelers from Japan. The pearls are produced by live oysters covering a mother of pearl bead with a thin veneer exactly resembling the true oriental pearl. It is impossible to expose the fake except by breaking the gem which is an expensive process. Further importations are prohibited.

Gunmen who barricade themselves in houses and fight Chicago police will now have to contend with a portable fort of armor steel which can be handled easily by two men. The shield is composed of two sheets of hardened steel, joined in an obtuse angle and with holes cut through to accommodate guns. It is rolled on big casters.

A justice of the peace, of Phoenix, Arizona, has announced that he intends to fine all who are convicted of speeding when tried in his court $1 for every mile an hour they are traveling when arrested. The first speeder convicted paid $62.

The United States Department of Agriculture is experimenting with a tree which gives off a peculiar poison fatal to flies. If the experiments prove a success, the seeds may be distributed throughout the country to exterminate the pests.

"Moonshiners" of France are making a substitute for absinthe from parsley. The product is more deadly and powerful than the outlawed liquor.

Criminal proceedings have been begun against violators of the Migratory Bird Act who crashed into a flock of wild ducks with an airplane, killing a large number.

A fifteen-year-old boy made his first airplane flight in Pennsylvania recently when he took a trip hanging to the tailpiece of an exhibition machine. When the aviator took off with two passengers, the boy grasped the stabilizer and was carried along until the aviator noticed the youth and made a forced landing.

In China the mourning color is white; in Persia brown and in Turkey it is violet.

Zoppot, the Monte Carlo of the North, near Danzig, advertises free air trips for those who wish to gamble at its tables. Advertisements appear in the papers of prominent cities in Germany stating that a special casino for air voyagers is in operation in which the limit of play is six thousand marks.

Nine persons die of accidents in the United States each hour.

President Obregon, of Mexico, has ordered the return of all properties seized by past governments in Chihuahua, Coahuila, Tamaulipas and Nuevo León, including that of the Mormons in Chihuahua, tracts owned by Luis Terrazas and lands abandoned by Americans when revolutions broke out.

For every hundred tons of coal mined in the United States, two tons of wood are needed for the extraction, for the most part for the construction of mine props and galleries.

The Coliseum in Rome has been leased to a motion picture company for a number of years.

COURAGE THAT DOES NOT FALTER!

And a Magazine Devoted to YOUR Interests!

The American people are paying tribute to the one magazine in this country which has courage to print the truth—which does not fear the powerful interests that exercise such a tremendous influence on the newspapers and periodicals of the United States. Not only are we continuing the discussion which has aroused the entire country to the conditions which have been created by a highly-organized minority, but our plans call for the publication of further truth-telling, informative articles on subjects which for the most part heretofore have been denied the public.

Lean Days for "Saviors of Our Country"

By H. R. PINCI

ARCHEOLOGISTS who have reconstructed on paper some of the ancient palaces that once adorned the Nile country believe that these contained, among other ingenious improvements, an echo chamber—a self-phonographic sort of room where all self-invited callers were obliged to tarry a while before being permitted to go farther. On the theory that murder will out, so in apparent solitude a man's conscience will think—aloud. This fiendishly clever discovery about man's weakness brought about the isolation from the rest of mankind of the patriots, whose breed has been prolific ever since.

While cooling their heels, therefore, on the stone floors, those unsolicited visitors yielded to the subtly compelling temptation of rehearsing their part and speech, as do all mere mortals who expect to be ushered before the great and the near great. As on occasions these thoughts were more loud than wise, and faithful acoustics did the rest, interested families went down to the nearest quarry and ordered another obit sculpted.

Cleopatra, who did everything in the open, if we are to believe the pictures of her we see, tested her visitors by means of this whispering gallery, and thus the royal ear heard in advance if it was a lover with a couple of tickets for the dahabeah excursion or just a patriot who wanted an ambassadorship to Rome. By means of scientific architecture, therefore, Cleopatra had the advantage on Harding's human secretaries just as Thothmes III had it on Cleveland's telephonic intelligence.

Cleopatra's Bulge on Callers

HOLDING up the executive's hands was a fashion in vogue in the days of Cleo and Thoth and not discovered by the Democrats in 1919, and to prove this the student is referred to the pictorial incisions on ancient monuments. Nowadays only a few exotic dancers have succeeded in bending the wrists at right angles without dislocating the bones. Certainly no President could ever hold up his own hands that way without help—hence the rush of help.

Despite some very efficient inquisitorial activities on the part of those who surround him, no President may protect himself from the patrioteer's persistence, although the latter as a class is responsible for some of the best golf scores by a few Presidents, because every time Taft, Wilson and Harding made a long drive is when they thought that the dull thud was the impact of the club against a patriot's dome.

There is a great difference between the patrioteer and the citizen. It would be an injustice to confuse one with the other. Let the former have all the credit—even though his hunt is for cash.

The citizen is that nobody who does his bit and pays taxes and honestly believes all campaign literature, while the patriot, having nothing to pay taxes on, always discovers infallible remedies for saving the country. The citizen stays at home and very likely has never seen a President in the flesh. The patriot, instead, goes to Washington whenever he can, and his mission in life is to call on the President himself.

His great ambition, though, is to save the country. The only way is by means of a job. But a job, of course, does not necessarily mean a chance to work. Working and saving the country are two different things, and the patriot alone believes that one means the other.

As every well-regulated family sooner or later finds a patriot in its midst, with the chances much greater now that the females have been added to the males, it would be a touchy subject to speak about them, but the very abundance and thorough distribution of patriots per American family by either year or generation provides that anonymity which goes with collectiveness.

Of course, not all potential patriots can translate their ideals and lofty purposes into action, and therefore nine out of every ten are predestined to suffer silently in obscure places, like genius unrecognized, and to pass their years engaged in some prosaic vocation instead of earning a future bronze statue by way of Washington. As it is impossible to do away with every tenth adult inhabitant, there is no way of eliminating the patriot. Even being jobless does not fease him, and it seems as if his is the only human species that can thrive during the high cost of living without working. A hardy stonecutter or spikedriver or longshoreman would kick the bucket in no time after a few payless Saturdays, but the most delicate, fastidious, hothouse patriot can wrestle with old H. C. L. and count it out at first blow.

Real Saviors Suffer

A FEW years ago the spoils system, despite the anti-patriot Civil Service Commission, provided an outlet for the exuberant industry of patriots who save the country as ushers and thus keep out desirables and traitors and what not in lieu of a place as assistant secretary.

The war, however, raised a disturbance in civil service circles, so that even today Congress is attempting to restore order, but in the meantime the old-fashioned patriot who hung around until his congressman fixed him up, content to accept a hundred real simoleons per every thirty days has become extinct like the dinosaurs. In his stead there is the fervent patriot who has become a sort of dollar-a-year man, but, this privately, unable to finance himself in Washington, will draw anything at all by way of "nominal expenses."

Thus there came before the country a class of government workers of class one or possibly class four who, instead of being God-fearing, honest-to-goodness clerks in the Federal employ, labeled themselves fellows who came down during the emergency, "the war, you know," and were not salaried like the rest of the common run of humanity, but on an "allowance." As far as known, they are still working for the sovereign people of the United States for nothing, except possibly a dollar a year, the rest of the per annum total being maintenance by a good old uncle.

Naturally this gave the advantage to those who came to Washington with one fell swoop, as the saying goes, to do some saving while the saving was good. But it left the others at a distinct disadvantage.

Needless to say, those mostly sinned against in this respect since the end of the war have been the real savers of the country; the soldiers and the sailors and all the others who dealt face to face with a very real and destructive menace.

Not a few of these men would welcome a job, and do the best they could at it, but to be taken for better or worse, because they need the money. But having used up most of their strength and energy and even health in looking for the enemy, they are unequal now to the task of looking for a job except by implication. Moreover, the patriots are pretty active and they wag a sarcastic tongue, with the result that the easiest roads to a government job are now obstructed by those with a mission.

A few years ago the patrioting hopefuls could be singled out by a distinctive sort of habiliment, one of those phenomena that just happen. Due probably to the fact that the outsiders looking in were from the South, where they observed all the proprieties, Washington's streets and public places where no entrance fee was required, were noted for the countless men in frock coats at least two sizes too great, black fedoras, that somehow one has since connected with the West, creaseless pants modeled after those of Robert E. Lee, the effect embellished by a white-lawn string tie, unless the owner happened to be a fiery patriot who ate 'em alive and proclaimed so with a red necktie.

This year the effect is different. There is no distinguishing characteristic sartorially; they are blurred against the rest of humanity by the few national tailors who are responsible for some of the alleged styles, whose nobby lines clothe and conceal the angular lines of an unoffending bookkeeper with the same precision that they straighten the fronts of wealthier stouts. Thus the straight-front no longer alludes solely to milady's intimate garment.

Moreover, the poor man's club in ante-prohibition days was a lodestar and between Fourth-and-a-half and Seventh streets and Tenth and Fifteenth streets on Pennsylvania Avenue could be found any number of patriots waiting anxiously, and the untutored might have been led to believe that their nervousness was due to terrible responsibilities, which were easily set aside whenever a good sport came in.

Again—who said the South was not fortune's own stamping ground?—when it was the South's turn to be outside looking in, Washingtonially speaking, railroad fares were very low and a skillful patriot could always talk his favorite railroad into a pass—for they were the days!

Heartrending Scenes

TODAY, so destiny has willed it, with the North wishing to look in, railroad fares are sky-high and the hardiest of patriots hesitates before resigning himself to the uncertainties of an uncertain reception. A bottle of ginger ale or near-beer does not carry with it the service table of plentitude of yesteryear, with sausage, roast beef, chipped onion, sardines, mustard, cheese, crackers, olives, radishes, and then all over again. Patrioting today is an expensive pastime, and even if one be fortunate enough to connect up reasonably soon, the prospective salary is not rebounding—and cannot take care of experimental incidentals.

The cost of high living, for the patrioteer, has been met by a corresponding sense of selectiveness of his part. Everything being higher means nothing; his services in saving the country are available at a higher figure. Thus the ordinary rock-ribbed sure-meal clerkship he disdains, at least at the present writing, and he is perfectly willing to let Uncle Sam do without him for a few days until something like his figure can be agreed on. Statistics mean something in his case, and the mere fact that the United States is supposed to be a nation worth in the altogether the bagatelle of $475,000,000,000 makes it only the more imperative that it be saved, or safeguarded, or protected, for a gentleman's salary, and not a sou marque less.

"Why," they say nonchalantly, as though each had learned the words and gestures at one school of elocution, "a corkscrew factory would pay more for a twister!"

"Well," says the tired young man who distributes the application blanks at the Civil Service Commission offices, after explaining the conditions of the forthcoming examination for chiropodist at the zoo, "we all know that the government does not pay very liberally."

Then follows an almost heartrending scene. Another patriot unexpectedly enters the room, and two hearts with a single beat, two souls with but a single thought, two "tummies" with a single hunger, two pocketbooks with a single (and last) dollar, meet. The two patriots face each other, sheepishly for the briefest instant, but who could read their secret except the fellow behind the desk who hears the fairy tales eight hours a day?

"John, back home," says the first with equanimity, as he looks superciliously at the blank in his hand, as he fingers it ostentatiously in and out of the envelope, "has just written to me about this job of paring the elephant's corns, and since he has been a corn expert all his life he thought it might do. So I came down to investigate. Maybe *I* can do something for him."

"Odd," smiles the other, as he moves a step nearer the railing, with the evident intention of getting himself a blank, too, "but our cook's husband S O S'd me to the same effect."

But to understand the patriot, and to know how to trail him, it is perhaps well to engage in a personally conducted tour and shadow him carefully. He has a way all his own. He is not like the other fellows who go to Washington on business—even the very difficult business of getting a job and advertises that fact to the world, or as much as there is of it in that city. The patriot in his patrioting days, which are those when he puts up a bold front, all dolled up, with lots of places to go but none to remain, is a reincarnate swashbuckler. D'Artagnan was a tyro at getting his first job even if he bluffed others into giving him one, but if he had happened along three hundred years after 1620 he would have had to do it all over again. His sword and his plume and his nag and his paw's benediction—pooh, says the new patriot!

At the White House Gate

THE *Succotash Bugle*, in its Saturday morning extra, carries an item something like this from Washington, undated:

"After a series of conferences lasting several days, the President let it be known that the situation is extremely delicate and will require careful investigation. So far no plan has been suggested."

That ends it. As soon as a patriot sees, then, it's all over. Washington for him? Better than that—W. Gamaliel shall know that an original Harding man is on his way, with all kinds of plans. Why pay $120,000 a year to ten cabinet officials when he can do it for one-twentieth?

The prolog may be very sad. A movie director could make it the original fount of tears, because where is the gink who wouldn't weep to see a movie of a man hocking his watch, or seeing a "good" friend touched for the price of railroad fare, and where is the jane who wouldn't gulp to see the hero leave his habitat, with everybody speeding the parting guest with fingers crossed except the mother, who alone believes her son can save the country?

The next scene is the patriot in his regalia, which no longer means a frock coat or a misnamed overcoat substituting therefor, and lo, here he is, at the western gate of the White House, now that it is open once more. He slows up, squirms in his coat to make it fit better, looks furtively but all around him to see who is looking, and approaches the first step like a man with something on his mind. To the bride and groom—or brides and grooms on the rubberneck trucks, he is pointed out as one of the statesmen, and looking toward his retreating silhouette it isn't hard to believe it.

The fact that the real man with business at the White House drives through the gates or hoofs it by the side gate on Executive avenue is nothing in the young life of any guide. Besides, every other man in Washington is a statesman, although no one has so far catalogued the state he is from or in—more especially in.

The patriot coughs, rubs a sole on the step as though he were annoyed by some chewing gum adhering on it, which is not so at all, and merely is an operation that wears out expensive shoes so much sooner, but the only nearly hospitable sign is when one of three officers in charge half-way meets him. They have bland smiles, these uniformed sufferers, but they have more eyes than Argus, and they meet the patriot to restrain him from producing from somewhere a sheaf of papers, memorandum books, a diploma or two, because if these patriots ever get a real chance to unfold their correspondence and other exhibits, from A to Z and from AAA to ZZZ, it would be all over.

It is obvious that it is taken for granted he is a great man, because so far no one wants to examine the testimonials and lodge pictures and the mayor's rubber stamp letter thanking him for having removed the decaying fence from his backyard. So he takes a deep breath and holds on to as much of the poor ozone inhaled there—three-fourths of it is hot air—and thus rotunded in chest measurement hies himself toward the rear.

Gets the Once Over

HE SEES a few persons idling about, some silent as statues, a few sitting upright, stiffly, the only kind of ladies and gents-in-waiting of the President by the way, and others laughing, talking, whispering, hatted and unhatted, so that the patriot hardly knows if he is in the midst of his future official peers or of his future menials.

He looks again; and he sees a handsome gentleman who looks his way indifferently, and he—the patriot—nods with a sickly smile. But lo—light of lights—he remembers the fellow; of course, hadn't he seen him in the movie weekly riding with the President? But this gentleman—of which there are several but of whom no other description should be herein made than to say that they are handsome, which is truth—has optically photographed the stranger, classified him as country-saver MX-39, and is off. He should worry! Which proves in this instance that it is better to be the man outside than inside.

Well, good old Pat, for whom a special cloud has been selected in paradise—though here is hoping his tenancy is away off—goes through his ordeal—and he, too, hastens to restrain the patriot that his papers are all right. All he wants is to find out if Congressman S. And Soh has "made an appointment for him?"

Well, not exactly, but here's a letter. It calls upon the organized and unionized White House staff, from one end to the other, to do all they can to facilitate the mission of his valued constituent, who had the pleasure in November to cast his vote for the man within.

Right here and now is where the patriot may get his,

(Concluded on page 13)

A High-Brow Hobo Whose Specialty Is Memory

One of America's Most Original Characters—a Tramp Who Has Made a Fortune Memorizing Dates in History

By LINCOLN QUARBERG

HERE is a high-brow hobo who is the modern laughing philosopher. For him, Edison's hundred "stickers" would be easy as falling off a log; but he does not want a job. He prefers to gather at street-corners the nickels bestowed in appreciation of his astonishing memory. Crowds try in vain to stump "Railroad Jack," and Ann Arbor students are amazed by his prompt and witty replies to hot and fast quizzing, at five cents a throw. Jack travels thousands of miles yearly without spending a cent. He has at tongue's tip brief biographies of five thousand notables and clusters contemporaries of any historic era. Laughing through life he has solved the living cost problem and wanders care-free over the earth.

"GIVE me a date—any date in history—and I will name the famous men who were living at that time and how old they were to the year."

Hundreds of university students are congregated at a corner curb, when clarion-like this strange challenge rings forth from the center of the assemblage.

A student, eager to test the challenger, shouts, "1820."

"Daniel Webster was 38 years old; King George III died that year at the age of 82; Queen Victoria and her husband were seven and nine months of age, respectively, at that time; Pope Pius IX was 30 years old; Robert Fulton was 55."

Another student cries, "1850."

Instantly comes the reply: "Champ Clark just dropped into the world; Darwin and Lincoln were 41; Spencer was 30; Ruskin, 31; Leo XII, 30."

The questions continue, and in deep, sonorous tones they are answered, without hesitation. And the auditors, one by one, convinced they cannot "stump" him, walk over to the speaker, drop their nickels in the cash-box, and walk away—pop-eyed, bewildered.

What strange spirit might this be, whose ouija-like replies so baffle comprehension? A very ordinary looking human he is—though in dress he is as original as his profession. Conductor-like cap, blue flannel shirt, cut-away coat with regular blue serge trousers, broad shoes, and no socks—that is the official all-year-round fashion decreed for members of the unique profession of memory experts. And there being but one professional memory expert, there is but one man so dressed. And this is Harry D. Cooper, or as he is everywhere known—"Railroad Jack—Memory Expert."

"Railroad Jack" is an out-and-out hobo, of the high-brow variety—self-styled, self-confessed, and self-realized itinerant expert. And his specialty is *MEMORY*.

For twenty-five years he has "hoboed" in thirty-eight states, lecturing on historic characters from curbstone rostrums. On every occasion he has answered every question put to him by an audience, offering a dollar to be "stuck" on a notable. He knows 10,000 dates concerning 5,000 famous characters in history. At mention of any celebrity he will favor his auditors with the biographic high spots in that character's career, and at mention of any date in history he will name the great men living at that time, and their ages.

"Railroad Jack" first became a professional entity in Detroit 25 years ago, where his introduction to fame began with a front page story in a local paper, in which he was characterized as the "curbstone philosopher" or the "man who answers questions while you wait, if you wait long enough." Today he is probably the best-known man in Michigan. At least twice a year he visits the University of Michigan, at Ann Arbor, where he is always received with popular student acclaim. "My talks are especially appreciated by these students," he says, "who have heard my stunts for 25 years and always paid their assessments of five cents a throw."

"What were the circumstances under which Anne Boleyn died?" a student auditor challenged at one of "Jack's" recent visits to the college town of Ann Arbor.

"As the result of believing in the double standard of morality through influences of her despised husband, Henry VIII; the ax fell on her neck in 1536, causing her through the excitement to lose her head," was the characteristic reply.

"Railroad Jack" is an extensive traveler, but he does not pay for his mileage. He has traveled 50,000 miles by freight train, but since the advent of the automobile he relies on friendly lifts, and he rides on the average of six cars to 36 miles, daily, carrying his bed with him wherever he goes.

Although Detroit is his headquarters he has no post office address, and insists he cannot receive any "letters of congratulation, or letters of sorrow." He parks his bed in the great outdoors, the year round, and through a standing order of the police department of Detroit is the only man officially privileged to sleep out-of-doors in that city.

"Railroad Jack" is odd—but brilliant. He has a quaint philosophy of life, and despite his eccentricity and strange specialization, is nevertheless intensely human, and keenly humorous. "Oddity is my long suit and I wear it every day. My specialty in life is to attempt to do something that someone else has not thought of." And he has done it.

Born in St. Louis in 1864, this high-brow gypsy passed through a conventional youth, and studied successively for the teaching and medical professions. The records at the State Normal School, Oshkosh, Wisconsin, show that he attended this school during the years 1882-86, and at Rush Medical College, Chicago, this encyclopedic hobo was a duly matriculated student from 1886 to 1888.

"I prepared myself for an M. D. but out of respect to humanity I quit in my sophomore year," says "Jack" in his half-modest, half-humorous vein. "I felt that in so doing, future audiences that I had in view would not necessitate my appearance in the cemetery to give me an attention if not a hearing; and today people are enjoying life that might be material for mortality statistics. Now when I strike an historic cemetery I pick dates from tombstones. Although some don't care for those dates, I do.

"I have less trouble in keeping 10,000 dates in my head than some people do in keeping two dates since the high cost of living struck the world."

Cranks on the high cost of living will be interested to know that "Jack" has lived on sixty cents a day for twenty-five years. He eats two meals daily, at twelve noon, and at twelve midnight.

And although he wears a silk hat and high celluloid collar at times, he never wears stockings, so that the high price of silk is not a problem for him.

"I am offering eleven cents cash to find an individual who has spent less money than I have in the last thirty years," he declares proudly. "But with few exceptions I am very sensitive about telling what I do with this money," he adds hastily. "Yes, I have made a barrel of money; but," says Jack slyly, "the barrel is not very large. But I am prosperous; on account of the high cost of living I am a profiteer; while my expenses still run at 60 cents a day, my income has doubled. People are spending more freely, except myself."

Students and laymen alike, numbering thousands, who have listened to the "soap-box" lectures of "Railroad Jack" pronounce him a genius—but "Railroad Jack" himself insists that he is a very ordinary person, and attributes his remarkable memory to just plain bulldog tenacity of purpose. And no memory training school can lay a just claim to enabling him to memorize the vast fund of facts at his command.

"If students would apply themselves with the tenacity that I have, they would achieve something," he declares with due modesty. "Apply yourself in whatever line you choose, and you will succeed. Emerson said, 'Hitch your wagon to a star.' By that he probably meant that as you go through life, have your goal of ambition so far beyond the possibility of human endeavor that no matter how long you live, you will still have something to live for. In four years more, or when I shall have reached the age of 60 years, I wish to be regarded by an impartial public as the 'human encyclopedia of useful information.'"

That he will succeed cannot be doubted—for he is a specialist and a student. Eight years ago in Ann Arbor, Michigan, he spent ten hours a day in the university library for eight months. It is characteristic of the thoroughness with which the memory expert pursues his unique profession.

As "Railroad Jack" himself says: "My stunts are so original on the street corners that to prevent congestion of traffic I take up a collection as often as the traffic will bear."

Each year, with philanthropic pride, he gives a thousand dollars in prizes to Michigan school children who pass the best examinations in history. Years ago, before he created his original profession, he published a paper in Chicago, the *North Shore Eccentric*. The closing words of his first article he still quotes as the summation of his own philosophy of life. They are as follows:

"Then friends, as we go through life, let us remember the old advice, that with all thy getting, get knowledge, for 'knowledge is power.' 'Twas good advice years ago, 'tis good advice today."

"RAILROAD JACK"—Rich and famous hobo who has made a fortune doing what "No One Else Ever Thought of Doing Before." He knows 5,000 famous characters in history, and 10,000 important dates, and he defies any audience to "stump" him. Above, he is shown addressing a crowd of college students at Madison, Wisconsin.

Memorial Day

THERE can be no doubt that the World War has vastly deepened the significance of our annual observance of the day consecrated to the memory of those who laid down their lives that the nation might live. For one thing, the simultaneous celebration of the day on either side of the ocean, in France as in America and wherever the warriors of the republic have found their last resting places, brings to us a broadened comprehension of the meaning of American nationality. It is something more than the boastfulness of any petty mental provincialism.

"America is another name for Destiny," said Burke in a prophetic outburst more than a century ago. Today, we realize vividly that the American name must be identified with the cause of human freedom, the cause of justice, everywhere. Throwing ourselves into the war to preserve Europe and the world from the menace of Prussian militarism, we showed a generous readiness to spend ourselves to the uttermost for the grandest cause that can inspire the human soul, counting no cost too great in strenuous effort and sacrifice of blood and treasure. It was thus that we learned to know ourselves a nation with a mission glorious beyond that of any other historic people.

The bell that in '76 rang out the glad tidings of the birth of the American Republic in Philadelphia bore the legend: "Proclaim Liberty throughout the land and to *all* the inhabitants thereof!" Wherever the Stars and Stripes are borne aloft in peace or in war that proclamation is made anew. In the propagation of the idea of democracy, in making all our republican institutions the shield and buttress of "the institution of the dear love of comrades," the guaranties of justice and equity for all, we shall most surely build strong and great our own nation.

In the light of the World War whose heroisms we especially honor and exalt on Memorial Day, we are able to realize that its larger meanings have impelled us consciously or unconsciously throughout every crisis in our history. The Declaration of Independence but articulated the deeper prophetic meanings of the Revolutionary War. It was a declaration of the rights of all men to "life, liberty and the pursuit of happiness." It was a perpetual challenge to tyranny, oppression and unjust denial of freedom and equality to men in any and every land. It made inevitable the self-correction of the Civil War that wiped the stain of chattel slavery from our flag and preserved in more than pristine strength the union of states on which so much depended. In turn, as Lincoln so luminously recognized, that internecine struggle became one with more than political or territorial purpose. The men who died at Gettysburg died not merely that *their* nation, in any exclusive sense, should live; but that "government of the people, by the people, for the people should not perish from the earth." And just that idea was the great underlying motive—consciously or unconsciously and despite the sordid scheming of politicians and profiteers—of America's participation in the World War.

As we lay flowers on the graves of the soldiers and sailors who died for humanity in dying for America, may we realize that we shall most truly honor their memory in honoring Courage, Devotion, Patience and Self-Sacrifice given to the upholding of American ideals.

Why the Price of Coal Goes Up

To The Editor—I am a subscriber to your magazine, and I believe that it is published in the interests of all the people. Will you please advise me why the prices of coal for the year 1921 are as high or higher than they were for the year 1920? It does not seem fair that coal prices should stay up, when other products, especially farm products, are just about given away.
—F. J. Kolar.

MR. KOLAR, who is cashier of the Farmers and Merchants State Bank of Silver Lake, Minnesota, asks a very pertinent question and one which thousands of people in this country are asking today. Local coal merchants have sent out to their customers a "friendly warning" to lay in their next winter's fuel supply now, if they would avoid having to pay the higher prices likely to go into effect before snow flies. It is a matter of common experience that householders are now asked to buy anthracite at $18 to $19 a ton and bituminous coal at $14 to $15. Although these are about three times pre-war prices and an advance of some 10 per cent over last year's prices, we are now warned that we will have to pay still more for our next supplies before the summer is over.

In a recent signed statement, the press representative of the Wholesale Coal Trade Association of New York endeavors at once to deny that coal prices have been advanced and to explain why they have been advanced. We are told that many "independent" anthracite mines are shut down because under the present selling price they cannot operate at a profit. We are further told that "bituminous coal, against which there is a buyers' strike, is, and for the last three months, has been offered freely to industrial buyers at approximately what the United States Government says is the cost of production," and that "much soft coal has been sold at less than the cost of production." Anthracite, it is asserted, is now about 25 per cent lower than it was last winter. One reason advanced by this trade representative for public buying now is that Pennsylvania will, on July 1, begin collecting 1½ per cent tax on all anthracite coal mined within that state.

All of which is a rather involved and elaborate attempt to put up a smoke screen between the public and the cold, hard facts in regard to the coal industry. As was clearly shown in The Dearborn Independent last August, the alleged coal scarcity on which high prices are based is in large part a manufactured one. Our coal mines have a capacity of 700,000,000 tons a year: that is, they can turn out 13,461,000 tons weekly, as against an estimated consumption of 12,000,000 tons. At that time, in order to meet the objection that scarcity and high prices were due, not to any lack in the ability of producers to meet the demand, but to the inability of the railroads to move the coal from the mine to the consumer, the Interstate Commerce Commission instructed the railroads to distribute open-top cars to coal mines only for a whole month. The mines were then producing only 55 per cent of their maximum capacity. A slight improvement followed in the supply of coal cars, but not enough to count. It is plain, indeed, that the railroads have given anything but whole-hearted obedience to the commission's ruling.

The freight-car famine of a year ago no longer exists; but it is evident that the supply of flat cars is inadequate to the demand for the transportation of building materials to which preference is given over coal. That means the public's one hope of relief from extortion is an exercise once more of its emergency powers by the Interstate Commerce Commission. Even a year ago, while the people of the United States were suffering desperately from coal shortage, the mines were exporting 2,000,000 tons a month to Europe. Foreign demand this year, owing to the British miners' strike, has become so exigent that the coal operator can get almost any price he may ask for his product.

Coal operators are not lacking in pretext for their continued exactions of war prices from the consumer. Emphasis is laid again on the increased labor cost of coal production as a justification. This makes it necessary to repeat the reminder that the coal operators are far from limiting their increase in price to the increase in labor cost. It sums up in the typical instance quoted from the testimony before the President's coal commission in 1919:

> "The average amount received by labor for each ton of coal increased by 64 per cent, while the average amount received by the operators as profit on each ton increased by 250 per cent. By the time the much-talked-of increase in wages had reached the public, the average increase in the wholesale price of coal was more than four times the amount awarded to labor."

The Pennsylvania tax of 1½ per cent will probably be similarly "loaded." Surely the present state of things in England should convey its grave warning to America. The blindly selfish and stupid policy now being pursued by the coal operators here in restricting production is well calculated to plunge this country into the same sort of economic chaos and widespread suffering as England is experiencing. Must we pass through a similar experience before we learn that the welfare of workers, operators and consumers, in the long run, depends on establishing the cordial co-operation of all to give the nation the benefit of the largest possible output of coal at the lowest legitimate cost to the community?

The Great Napoleon

OUR age is one of iconoclasm and it would be strange if the name of Napoleon did not come in for its share of thoughtless derision. Beginning on May 5, Paris has been giving itself up to a five weeks' celebration of the centenary of Napoleon's death. His fame is sounded by Archbishop Dubois and the Abbé Hennoqué at Notre Dame. At the Arc de Triomphe, Marshal Foch and his poilus render homage to the idol of every French soldier. President Millerand, at the Sorbonne, pronounces the official eulogy and Maitre Robert, a distinguished jurist, discusses Napoleon as a lawmaker, while General Mangin, at the Invalides, expatiates on Napoleon's qualities as a soldier, and military writers comment on the battles of Napoleon in the light of later history.

Strangely enough, a newspaper campaign against the celebration was waged fiercely, especially in journals representing the Radicals and Socialists more or less associated with Lenin's Third Internationale. Edouard Herriot, mayor of Lyons and Socialist deputy, went so far as to refuse to serve on the committee in charge of the exercises on the ground that the manifestation was a political one. The Jews have no love for Napoleon. He compelled them to stand up and be counted. He kept them within single—not bi-national, rights.

All of which is sharp reminder of the truth that is bound to impress all who pass any time in the fair land of France: the truth that the life of the nation today, more than ever, reflects at every turn the undying influence of this greatest of Frenchmen who was born under the Italian flag. Napoleon is at this day the subject of more books and more lectures than any man in France before or since his time. He is more widely and variously celebrated in sculpture and paintings and monumental architecture. Among all classes, including the Royalists and the Radicals, the Napoleonic tradition and the Napoleonic legend is treasured and exerts a subtle but profound influence on life and thought.

Napoleon's fame grows greater with the passing of the years. If ever it could be truly said that "a great institution is but the lengthened shadow of a great individual," it can be said of France and Napoleon. At the close of a world war in which victory was won through close adherence to Napoleonic tactics and strategy, on the candid avowal of the Generalissimo in supreme command of the Allied and Associated Forces—of an army of some ten million men in the field—it is not strange that stress should be laid on Napoleon's military genius. That tremendous quality has well stood the test of time, despite almost cataclysmic changes in all the conditions of warfare, evolved in the century since his death.

Even the extreme pacifist, deeply disdainful of the claims of military genius to the admiration of mankind, and prone to dub every great general a "great butcher," a ruthless destroyer wading through slaughter to a throne, is beginning to realize that, entirely aside from his fame as a warrior, Napoleon must ever rank high among constructive statesmen. He found France impoverished, rent and torn within by revolutionary enemies of his country and of civilization and menaced, if not actually assailed, from without by the combined powers of Europe. He left his country solidly unified, great, strong, rich and prosperous, advancing rapidly in industry and all the arts, as in modern learning. His title to lasting fame might rest safely on the one achievement of the Code Napoléon, if that were his sole claim to greatness. The foremost of the world's militarists, as we now regard him, his boldness of initiative stayed the fierce swelling tide of European militaristic imperialism that threatened not only to devour France out of hand but to sweep over all the rest of Europe and even to sink its vulture claws in America. He made the pomp of emperors and kings and the boasted might of their seasoned armies ridiculous. For a generation, his name was hated in England as that of a black bogey. "Boney will catch you," was a threat used to bring naughty children to docility. But today, as Lord Rosebery's luminous biography of Napoleon shows us, it would be difficult to measure how much Britain owes to the influence of Napoleon for the democratic spirit that is her true greatness.

In his fall, as in his rise, Napoleon furnishes a striking example of the operation of the eternal verities in life. This does not lessen the value of that example. He fell because of his adoption of the very arrogance of those born in the purple with whom he had warred; because of his surrender to the temptations of luxury and the foolishness of imperial display. Nevertheless and all in all, he embodied France in a larger sense than Louis XIV boasted himself to be the State; and, what is more, he incarnated in commanding degree that sublime Power of the Human Will which on every plane conquers obstacles and ever transforms difficulties into opportunities and dreams into actualities.

Mr. Ford's Page

THE time is here when many young people are leaving school and casting about for clues by which they may settle the question of their careers; they want to know what they are going to do, what niche they will fill, what name people will know them by as to trade, service and success. It is a trying period. It is astounding sometimes how little can be done to help. The very anxiety of the search seems to be a stage through which the developing life must come.

There is probably not so much nonsense to be gotten rid of by the person leaving school nowadays, as there formerly was. Years ago no school was believed to have done its duty which did not send out every pupil filled with the idea that some day he (and now it would be also she) might become President. As the United States has required only 29 Presidents in the 145 years of its national existence, there has been a rather alarming waste of raw material.

The majority of people are blessed by being destined to the very best kind of life there is, the life of a plain person upon whom all the liberties descend and who with others of his kind constitute the ruling class of the world. They will not be President, nor Congressman, nor town councilman, nor even secretary of their lodge; they will just be folks.

It is very easy to state this another way. It may be said that "they are doomed to mediocrity." It may be said that "they are destined to live the colorless life of the common man." It may be said, "They are sentenced to a proletarian life."

These phrases are the scum that rose to the surface of those old false teachings that success consisted in getting the place that was accessible to only a few in a generation. Failing that, then life was "doomed" to be common. Utter rant and nonsense!

The very word "proletariat" is an insult, and if the majority of the people knew what it meant they would repudiate it and cast off the propagandists that foisted the name upon them. Proletariat means that class that is good for nothing but to raise children for the state—the lowest, most vulgar and useless type of human beings.

Yet whole bodies of well-read and highly useful American citizens are induced to parade around calling themselves the Proletariat, and reading about themselves as Proletarians. The man who calls himself a Proletarian, and knows what the word means, ought to be ashamed to look his wife and family in the face.

There are no such people as common people, in the sense that makes all the others uncommon. We are all common, or we are all uncommon, however you choose to look at it. The king is common, once you get to know him. The Presidential office is not a common office, but the President is common. Ask him, and he will tell you that he never felt himself to be anything but common. That is to say, people on the same plane of character are common possessors of pretty much the same qualities; they are citizens of the same commonwealth.

To say that the king is common and that the President is common is, however, not quite the whole truth; for these statements are made sometimes to soothe those who are in rebellion against being themselves. The major half of the truth is that no man is common; individuality, personality, the moral dignity of a human being as a creation of the infinite mind, these are the most uncommon things we can think about. No man is common. But in the compass of that fact, all men are common. They have a common uncommonness by virtue of their being human beings. Their commons is the universe.

Now, the book that the majority reads is said to be the best book. The food that the majority eats is held to be the most natural and nourishing food. The mode of life which the majority pursues is held to be the most satisfactory mode. The life that the majority leads may be called the standard, the normal of life. Very well; that standard, normal life is the same life we call common, and which some poor pitiable people regard as a life of failure. Life itself is at once the common and the uncommon thing. The richest and most successful person is the one who has the most life; and life is within; it is within and from within; there is no favoritism, no "pull" at the source of life.

Now that is what is meant when the false guides say "the majority are doomed to live the life of the masses," and that also is what is meant when others say, "the majority are going to live the standard, normal human life." That life is common to all. It is the life which everybody must live in order to live at all; the life of labor and food, of day and night, of home and family, of body and soul—the same life which the President must live in his White House and the pioneer in his prairie home. It is the same life. It ought to be a relief to know in advance that it is to be ours.

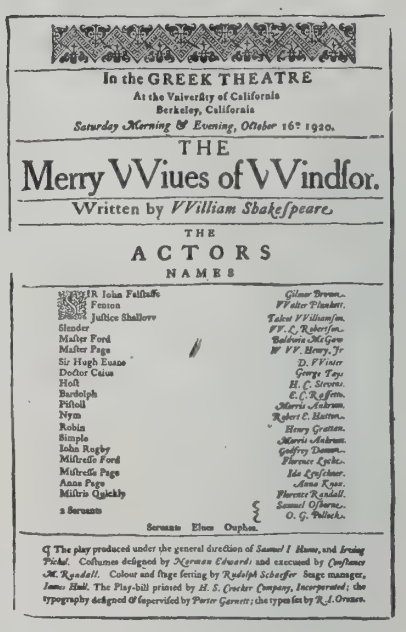
Life is divided into two main periods—the period when we take in and the period when we give out. Youth is the receptive period, and although that period does not end, there comes to keep company with it an expressive period when the individual makes his or her contribution to the general life. He does more than that, however; in his work he also makes a contribution to himself. The sum of earth life is the making of character. It is inevitable.

We make character whether we want to or not. We make it whether we are conscious of it or not. We make it wherever we are and by whatever we do. There is no special location or no special occupation which is more favorable to character-making than is another location or occupation. There is no station in life that is favorable to the production of a finer type of character than is any other station.

The more and better character that is made, the more the outer world is changed to conform to it. The money question, the industrial question, the political question, the social question—all these wait for the settlement of the character question.

The reason that high office is so powerless to bring about reforms, the reason that titles and prerogatives are helpless in making a clean sweep of injustices, is just this—no office or authority gets any further than the character that creates and fills it. Character is the great authority. Given character, office can be dispensed with. Presidents and kings and magnates of all degree are but the servants of great characters. And great characters are independent of riches or power. They *are* rich and they *have* power, and are therefore invincible in whatever right things they undertake.

We have rather successful inventions, successful businesses, successful policies, but not enough successful *men*. The success of a man is to become a Man in the character and power that make him, stripped and alone, a Man. And this is all within his own control; no outer circumstance can control that, but he can use that to control outer circumstance.



No one should be content with poverty, because if it is poverty instead of the clean, hard type of bareness which constitutes the voluntary "doing without" of camp life, it is degrading. If a man is poor, it should only be by his own choice. Many men have been poor by their own choice, and therefore they escaped the depression of *poverty*. In the perfect society, most people will choose to live on the plane of the average man of today—it is more comfortable, more human, more conducive to peace. The state to which the majority of society has attained today, with such corrections of the money and governmental system as will prevent dishonest tampering, is, with certain changes, approximately the state that will prevail when society becomes what it ought to be. Why not? What better base is there for the development of character?

THE life that the majority of people now live will probably constitute the standard of life in the perfect society. What most folks have found good and worthy, no future system is likely to upset. When the blind guides of social discontent announce that the majority are "doomed to live common lives," he does not see the uncommonness of our common life, nor does he see that the so-called common life is far and away the best life of all. It will need a little more room, a little more leisure, a little more sense of security, but all in all it is the type of life the majority of the people are going to choose when the social millennium permits every man to make a choice. The common life and character constitute the golden age.

Even the Carpenter May Play Shakespeare

That's One of the Things Revealed by Sam Hume and His Greek Theater at Berkeley, California

By EARL CHRISTMAS

In the GREEK THEATRE
At the Vniverſity of California
Berkeley, California
Saturday Morning & Evening, October 16th 1920.
THE
Merry VViues of VVindſor.
Written by *VVilliam Shakeſpeare*
THE
ACTORS
NAMES
Sir Iohn Falſtaffe — *Gilmor Brown*
Fenton — *Walter Plunkett*
Iuſtice Shallow — *Talbot Williams Jr.*
Slender — *FF. C. Robertſon*
Maſter Ford — *Baldwin McGaw*
Maſter Page — *W. VV. Henry, Jr.*
Sir Hugh Euans — *D. Vinter*
Doctor Caius — *George Toy*
Hoſt — *H. C. Stevens*

Miſtreſſe Page — *Ida Kruſchner*
Anne Page — *Anne Kyne*
Miſtris Quickly — *Florence Randall*
2 Seruants — *Samuel Osborne, O. G. Pollock*
Seruants Elues Oupheſ.
¶ The play produced under the general direction of *Samuel I. Hume*, and *Irving Pichel*. Cottumes designed by *Norman Edwards* and executed by *Conſtance M. Randall*. Colour and ſtage ſetting by *Rudolph Schaeffer* Stage manager, *Iames Hall*. The Play-bill printed by *H. S. Crocker Company, Incorporated*; the typography designed & ſupervised by *Porter Garnett*; the types ſet by *R. J. Orozco*.

SAMUEL J. HUME and the Greek theater at Berkeley are institutions in California. One connotes the other. Each holds a vital place in the community and together they provide an interesting commentary in these days when men are reaching out, seeking a means of developing wholesome entertainment in their own cities.

With the growth of the motion picture industry and with unfavorable business conditions recently, the West, indeed the greater part of the country, has found its opportunity to see good plays on the legitimate stage even more restricted than in the past. New York always has dominated the theater in the United States, but just now it has an almost absolute monopoly. To most cities over the country right now, the legitimate theater is a dark house.

So, men and women who are seeking entertainment without dependence on New York, or those who are rankled a little at the commercialism in its products, may find some refreshing moments in a visit to Sam Hume and his Greek theater at the University of California.

Hume holds a unique position. Perhaps no one has done so much to interest communities in better plays. But more significant still, he has been gathering the players for many of his productions from the communities where he worked. He has gone far toward making the community and art assume a vital relation to each other. As director of the Greek theater at the University of California, Hume has a yearly audience of 150,000 persons and takes in box office receipts of some $80,000 a year, though receipts are incidental in this uncommercial theater.

For eight months a year the beautiful outdoor theater at Berkeley is the center of musical or dramatic activity for the community. Incidentally, it is the largest open-air theater in America, and considered by many as the most attractive, sitting something like an architectural jewel in a spot of the greatest natural beauty.

Stage of the Greek theater.

Every Sunday afternoon, there is a free concert, and four or five thousand people gather there to hear the music. Six thousand persons can be seated in the theater, and at university assemblies and other notable occasions several thousand more may crowd in. Plays and musical entertainments are given there for more than half the year, so well is the climate of California adapted to the outdoor play. Indeed, California has gone further than any other section of the world probably in the development of the outdoor play.

But the activities of the Greek theater at the University of California don't stop with the coming of winter. The players just move indoors, and the plays go on.

The activities of Sam Hume and his Greek theater cover a wide range. Recently, in six weeks, he staged three Shakespearean plays, the "First and Second Parts of Henry IV," and "The Merry Wives of Windsor."

"We utilized student aid," Hume explained. "We obtained the best amateur talent in California. We used professionals. We went here and there in search of performers and the result was that we had a blending of amateur and professional talent that would have been hard to excel.

"We had all our costumes made in San Francisco, of fine stuffs, dyed in solid colors. All the costuming, the armor, the furniture—all were true to period.

"The cycle was presented in the Greek theater, and the shows were a great success. That's one thing that we have demonstrated—the people will pay for good shows. The Greek theater is self-supporting. I don't mean that we need to commercialize. If there should be a deficit, the university would assume it. That leaves us free to produce the kind of shows we wish without making concessions to the box office. However, we have found that the plays have paid their own way.

"We do not try to cater to the high-brow. We aim to present just good, normal shows, and we try to keep up our standards. People get so they know what to expect when they come to the Greek theater, and we try not to disappoint them.

"After the Shakespeare plays, we started a series of modern plays, beginning with Wilde's 'The Importance of Being Earnest.' Such big crowds came to see this that we gave a bill of one-act comedies and Ibsen's 'Pillars of Society.' Then we followed with a series of six modern plays, offering such plays as 'The Very Idea,' by William L. Baron; 'If Shakespeare Lived Today,' and 'Fame and the Poet,' by Dunsany, and 'The Thunderbolt,' by Arthur Wing Pinero—plays of that type—and we found them exceedingly well received."

Besides providing entertainment designed to stimulate appreciation of art, Hume is engaged in the interesting task of discovering talent for his plays. For instance, the head carpenter at the university is one of his Shakespearean actors. The wife of a professor is another.

"Our company is made up of students, of residents of Berkeley, of anyone who wishes to work with us and who has inherent dramatic talent," he explained. "We have a lad and his father, a white-mustached middle-aged man. We have a woman who has been with a San Francisco stock company. We have a woman from Illinois who was a school teacher; another from Vancouver—oh, it is a group of cosmopolites without social strata."

But the significant thing is that Hume finds talent in his community to present most acceptable plays. It is interesting here to note, too, that the Greek theater belongs not alone to the University of California. Rather, it is a community institution. The greater part of his support, Mr. Hume explained, comes not from university students, but from residents of the community who come regularly to the theater to see the shows. In other words, the Greek theater at Berkeley has come to fill a vital place in the community.

Hume also teaches play writing, and frequently his students write productions which are presented.

"I have no idea in the world that I can teach play writing," he said. "I even refuse to call the roll. I am only hopeful that someone in the class will be stimulated to think for himself, and express real ideas."

Besides plays, Hume presents concerts and pageants. Last summer he produced the Cranbrook masque at Santa Barbara. Each winter he goes to St. Paul, Minnesota, where he directs an annual Christmas festival.

For the Christmas City festival in St. Paul, he will prepare a play appropriate to the season, assembling all his actors and his choruses and training them in a few weeks. The festival of the Christmas City covers several days and constitutes each year an event of city-wide importance. Signs on the billboards proclaim St. Paul as the Christmas City and enjoin all to recall the spirit of the season. Candles in the windows, which has become a municipal habit with the growth of the institution, emphasize the appeal.

A section of the largest open-air theater in America at the University of California.

Then there is the municipal Christmas festival, and on another day a festival for the children, when 10,000 boys and girls crowd into the auditorium to see Sam Hume's Christmas play.

That's the sort of thing Hume is doing. Often he takes a part in his own plays, turning actor as well as producer. Out in the Greek theater he arranges for symphony concerts. There are art exhibits, too. He gave a show with Ruth St. Dennis that packed the big open-air theater with 7,000 people for each of two performances. The Greek theater has been the scene of some notable productions. Included in the number were the revivals by Margaret Anglin of Sophocles' "Antigone" and "Electra." Maude Adams presented "As You Like It" there, and Sarah Bernhardt produced "Phedre" there. The Greek theater at Berkeley thus serves as a medium for the best actors as well as a means of expression for the amateur.

Among the varied activities that center in the Greek theater, there is none more interesting nor more significant than the annual Shakespeare contest. Students from the high schools in California hold preliminary contests in reciting passages from Shakespeare. Then in the spring, they meet at the university for the final contest.

"Everyone has a natural inclination to act," Hume explained. "So, we find that the boys and girls enter into this contest with great zest. It opens up to them possibilities of which they never dreamed before. They obtain an interest in Shakespeare that you couldn't instill so effectively in any other way. Another thing that we are finding almost as popular is the choral contests. I hope also to start an orchestra contest for the high school students.

"You see, we try to make the Greek theater and this department of the university a sort of nucleus in a dramatic way for the state."

Hume has an idea that the rest of the country need not be so dependent upon New York for its dramatic entertainment.

"There is no reason why one city should dominate the country in that respect," he said. "Gradually as the cities in the West are growing, things are changing. Before long, there is going to be a new development in this line. Each of, say, eight or ten cities will develop a group of players of its own. It will be something better than the old stock companies, and organized on a different basis. One group of players may remain in one city for a period of several weeks, and then go to another city, the different groups changing about.

"This thing, or something like it, is coming, and it is coming so quickly that everybody will be surprised.

"When the West develops some such plan as this, it will have shows just as good as those in New York. With such a powerful organization, it will be able to get first productions of all the best authors. Cities in the West are growing rapidly, and the demand for such a development already has made itself felt. Such a project actually has been planned. It may soon be a reality.

"But even without such a development, most communities can provide good, wholesome entertainment at home. Your distance from New York need not limit your entertainment in a dramatic way."

This reminder that no American community need be dependent on New York for its dramatic entertainments is, of course, the hopeful significance of the success of Berkeley's experiment. Emancipation from the thralldom of a theatrical control that has tended in late years to the steadily increasing debasement and demoralization of the American stage is a consummation devoutly to be wished.

On the positive and constructive side, Mr. Hume has demonstrated that such a people's theater, drawing upon and developing local talent, may be built up in every community. There can be little doubt that such an institution would, in short order, prove effective in promoting a revival of that wholesome and gracious culture which has made the Athens of Pericles renowned through the ages. The cordial reception accorded in the past to Ben Greet's players indicates that there is no lack of appreciation of genuine dramatic art in America. For the play given in the open with sylvan and picturesque background, our people have a special liking. California's climate is a great asset; but over the greater part of the United States, it must not be forgotten, we enjoy an approximation to California's climate for at least five months in the year.

Borrowing the Eyes of a Lover of Nature

By ARTHUR PEIRCE VAUGHN

"NOW I won't lose it!" and Charles Livingston Bull shoved a scrap of railway time-table toward me, and on its margin a tiny pencil sketch of a small blue heron with its neck distended to inordinate size. For all its minuteness the bit of a picture was accurate in its drawing and in its record of form and effect; crest feathers showing as dainty needle points at the back of the neck, and hackle tips drooping from the downy bib of the breast.

It was the mating season of spring, and the slender-necked heron was probably preening in amorous display. The fact that it could inflate its throat like a drumming partridge or pouter pigeon was "very interesting" to the artist and nature lover.

We were at the time chug-chugging along in a little motor boat through one of the innumerable placid channels that wind and wander behind the outer keys on the south Florida coast. Where the water widened into a lagoon and shallowed, four great blue herons were doing their early morning fishing—I found the four after C. L. B. had given me the number, and was rather pleased with the achievement even then. One was posed with its long neck, head and beak extended in a straight line, pointing skyward. Two were motionless shadows in the edge of shadowy mangroves. And out in the flaring sunlight at the marsh edge a gray, weathered stick of driftwood lifted angularly above the water.

"That one reproduces in form and color a sun-bleached log exactly," said the artist. "One does not wonder the fish come nibbling around its feet without suspicion."

Mr. and Mrs. Bull spent part of their Florida outing in the little settlement that clusters around a fine, outdoor boys' school on one of the Gulf islands where the open-air winter is always sunny. One night in the school's big common room the artist for two hours drew animal pictures for the boys on their dusty classroom blackboard with their own common chalk—two hours of sheer delight for the writer. He blocked out studies for a series illustrating Aesop's Fables; then worked out a design for a tiger and bamboo page illustrating protective coloration and markings; and finally did two or three large animal sketches by request of the boys. The drawing was deft and exquisite. The flying chalk tip traced curious, unexpected little angles and quirks of outline and modelings of muscle that looked strange at first, but served the final beauty and truthfulness of the picture, giving it a distinctive and delightfully accurate individuality. Such skill has been attained only after years of trained observation, in the open and in the museum, and as dissector and taxidermist. Behind that are still other years, from earliest childhood, of intimate, friendly association with all the common animals.

The moral of all this is easily read—Surpassing excellence in art, as in every other thing, comes only as the fruitage of long love and labor.

I'm sure the truth is not overstepped in writing down C. L. B. as one of those who would rather, any hour of any day, eat in the open than under roof—and may their tribe increase! Unless other definite business forbade, it was not difficult to get his acceptance on any proposal for a venture afield, by preference on an untried trail, with a campfire meal wherever appetite caught up with us. For those "outer" meals he has the investigator's curiosity (and courage too) in trying new dishes, new combinations, and new fruits, especially the local products with which he is not familiar.

How "very interesting" is the world in which a naturalist lives and moves and has his being! Of the hours and days that were spent so happily in the open I think there was no instant when his senses were not tuned to any appeal that might impinge upon them. The merest hint of color or outline, unnoted by others, revealed to his eyes the leafy ambush of some bird; the stroke of its wing in distant flight gave its identity, as its faintly far note of song was recognized by his ear; and odors fetched their information definitely—to most of us their messages are very vague.

The approach of our boat sent a startled young heron darting erratically through the palms, its snowy plumage mottled and blotched with blue. It was in mid-change from the white dress of infancy to the duller garb of maturity, and was "very interesting." One midnight we rowed down one of the "little rivers" for which C. L. B. has a poet's love, with tropic foliage looming against the jeweled heavens, and drooping and dripping in the ripple from our prow, that silently rocked the stars on the mirror water and knit long lace streamers of phosphorus across its velvet blackness. Beyond a colonnade of palm trunks lay a wide marsh, with millions of fireflies. Often in the southern woods these midnight marshes are a vivid sheet of will-o'-the-wisp light. But this was different. The flash was intermittent over the wide flat, perhaps a mile square; it was periodic, like the flash of a lighthouse. All the insects shone at once, and were dark over the whole stretch the instant following. Undoubtedly it was an instinctive reaction, like that seen in the darting, instant change of direction by large schools of minnows or large bevies of birds in flight. But it was new—and "very interesting." It was pleasure to watch and share somewhat the naturalist's delight in every new trick of wild things, and every variant of habit and of past experience that forest and stream yield constantly to alert eyes. No idle studio argot, this "very interesting," but the simplest expression of a perennial, continuing response to the thousand-tongued call of life and beauty. One cannot conceive of any stretch of the earth's surface that would not verily interest him—except, perhaps, a too thickly populated drawing-room floor.

And it is good for us everyday folk that we have men, for our generation, who have as vivid interest as had Solomon in all things of nature from the minute to the stupendous, from the hyssop on the wall to the cedars of Lebanon; who have also the skill to reveal to us in assimilable form their love-bought knowledge.

One early morning I found Mr. and Mrs. Bull on a river dock waiting to board a little inter-island steamer that was loading passengers and nondescript freight for her day's run through the warm-water channels of the Gulf Coast. In the distance two birds were winging up the sky with the grace of a soft, old Japanese drawing. Mrs. Bull questioned their identity, and I ventured a guess. The artist, coming from booking his luggage at the moment, saw them and named them at once, the wood ibis, though I think he had seen none of their rather rare species for years. Two more of the winging ibises followed, then six, lining landward to the rookeries of the dusky cypress swamps for the day. Another evening, a fortnight later, we had the good fortune to be afloat on Orange River as the ibises were in flight back to the mud flats of the coast for the night's fishing. First four, then two, then a larger flight, twenty-six in all—an unusual number to be seen together in these later days. So sometimes to those who in the love of nature hold delight in her visible forms, rare privilege and beauty come. For the wood ibis with its stately gesture, its ever graceful flight, and its sharp conjunction of snowy and ebon plumage, is always a delight. On a goalless boating expedition among the coastal keys one day a great osprey wheeled and fluttered characteristically above us for some minutes, swinging to the light so that all the lovely design of its underfeathering stood out, the original pattern in black and fawn that has been reproduced by artists in decorative borders since the days of the early Egyptian temples. With eyes continually on such "copy" it is little wonder that Charles Livingston Bull's work is always decorative—as well as exact. And it is also always simple in its effects; there is no useless lugging in of the superfluous. His work shows strongly the influence of Japan. Perhaps it would be more accurate to say that the principle of Japanese art, the correct recording of the essential with a disregard for all else, is the principle on which he has worked. So one finds in his pictures the vivific action of old Japanese drawing, action that we were a little doubtful of until quick photographic lenses proved it to be true, and our own western, conventional representations of motion mistaken.

CHARLES LIVINGSTON BULL

The log of other impromptu expeditions might be added—of an alligator chase in the cypress, very successful, from which the hunters returned with eyes keen, alert and sparkling with the keyed-up pleasure of the day; of a midday rest in a cypress head, its pool filled with lily pads and drumming frogs, and the air above hung with wheeling hawks that should, by book and by reason, already have had their nests built a thousand miles to the north, but instead had apparently settled in the South as permanent summer residents; of a morning spent in exploring Thomas Edison's estate, with its shadow-dappled pleasance under great pines along the waterfront, its great bamboo thickets, rare fruits and exotic trees and flowers. These all are memories rich enough to make one greedy of them; memories that I would willingly retain as long as the enjoyment of memory is mine.

C. L. B. is one of the goodly company of quiet folk—to whom the earth yields far more of its wonder and beauty, I am sure, than to many thrusting, flamboyant personalities of our day. He has a quiet smile, and comfortable friendliness—both genuine surely, for they are things that are beyond the possibility of counterfeiting. In a world that has grown all too noisy, where men as well have caught the malady, how good it is to find one in whom quiet still has its values. Noise seems to me to belong to material contraptions, maladjusted at that, and there is something certainly wrong when it invades the souls of men.

Bull is fascinating in his loyalty to his friendships; and these include the finest of our age—naturalists, poets, artists, humanists. For example, a train hurrying to a scientific convention in one of the eastern cities, carried in its diner at one table some years ago, John Burroughs, Henry van Dyke, Edwin Markham and C. L. B. And the three older men spent their time "borrowing the eyes" of the youngster, and the things he had seen of the life of the wilds. He is quick in his appreciation of the work of other artists and the work of writers, wherever there is reality and delicacy of craftsmanship and freshness and naturalness of expression. Also there is quick revulsion when any carelessness or affectation or untruthfulness of portrayal shows itself.

If one held right of search I suspect there could be found in his vacation luggage always some of the best new books, on plants and birds and beasts, and other books, unhackneyed and vivid, that tell of expeditions in the open, beyond the end of used trails. For he can see beauty through other eyes than his own, and is always in search of it. And all of beauty that nature has to offer is grist to his mill.

Middle-aged, perhaps, you would call him. Which means that C. L. B. has his best work still to do and his richest life still to live. A score of years ago he came from a little Rochester art school to New York City, a youngster, with a pack of drawings under his arm for a try at the cynical world. The first magazine to which he submitted his work wanted to contract his output, I believe, for a year. Those were the "good old days," and one of the great magazines that has helped make America famous for her periodicals, was in its glory. On his second day in the city, in the offices of that magazine, the dean of art editors purchased some of his drawings and gave him further commissions.

"You are in luck, boy!" said this kindly, experienced judge. "There are men in New York who came to my desk here for years before they sold their first picture."

Having found his niche, doing what he loved to do, C. L. B. has continued to this day bringing bits of the wild to tame folk who could not otherwise come to them; spreading small sections of the open on walls under roofs where shut-in folk can enjoy them every day; and loaning to hearts that hunger for beauty, the eyes they do not themselves have—the eyes of a lover of nature.

Will Jewish Zionism Bring Armageddon?

Palestine Problems Constitute Serious Situation; The Balkan Question Moved to the Holy Land

WHEN the British Army passed into Jerusalem in the memorable capture of the city in 1917, the Protocols went in with it. A symbolic circle was thus closed, though not in the way the Protocolists had hoped. The man who carried the Protocols knew what they signified, and they were carried not in triumph but as the plans of the enemies of world liberty.

Zionism is the best advertised of all present Jewish activities and has exerted a greater influence upon world events than the average man realizes. In its more romantic aspects it makes an appeal to Christian as well as to Jew, because there are certain prophecies which are held to concern the return of the Jews to Jerusalem. When this return takes place, certain great events are scheduled to ensue.

Because of this admixture of the religious sentiment, it will be rather difficult for a certain class of people to scrutinize modern Political Zionism; they have been too well propagandized into believing that political Zionism and the "return" promised by the prophets are the same thing. Having succumbed to the initial confusion of mistaking Judah for Israel they have entirely mistaken the ancient writings that relate to these two, and have made the single tribe of Judah (whence comes the name of Jew) the hub around which all history and humanity swing. Judah was the tribe with which Israel could not live in peace over two thousand years ago, and which has the fateful gift of stirring up the same kind of dissension today. And yet no one ever thought of charging the Ten Tribes of Israel with "anti-Semitism."

Zionism in Russia and Berlin

ZIONISM is challenging the attention of the world today because it is creating a situation out of which many believe the next war will come. To adopt a phraseology familiar to students of prophecy, it is believed by many students of world affairs that Armageddon will be the direct result of what is now beginning to be manifested in Palestine.

For these, if for no other reasons, the subject becomes important.

With Zionism as a dream of pious Jews this article has nothing to do. With Zionism as a political fact, every first-class government is now compelled to have something to do. It is a bigger question than the German indemnities or American immigration, because it lies back of both, and is rapidly proceeding under cover of both.

It is worthy of note, if only in passing, that Zionism in the active modern political sense took its rise racially and geographically where Bolshevism arose, namely, in Russia, and that its center, the seat of its Inner Actions Committee, was at Berlin. There was always a close relationship between the Zionists of Russia and the New York Kehillah, as is evidenced by public utterances made in Russia after the Revolution in which the Kehillah is extolled.

Jews Free in a War-Locked World

AT THE time the war was declared in 1914, the Inner Actions Committee was spread about in various countries. For example: Dr. Schmarya Levin, of Berlin, was in the United States and remained here. He was Russian rabbi, German scholar, and cosmopolitan. Although his headquarters were Berlin, he remained in the United States and became recognized as the leader of the leaders of Zionism, until the great Jewish shift to Versailles. Another member of the Inner Actions Committee was one Jacobson, who was in Constantinople. "When he saw that Constantinople could no longer be the center of Zionist politics, he left and went to Copenhagen, Denmark, where in a neutral country he could be of practical usefulness to the Zionists *by transmitting information and funds.*" (Guide to Zionism, page 80.) In fact, the entire Inner Actions Committee, with headquarters at Berlin, moved freely through a war-locked world, the only two exceptions being Warburg and Hantke—and there was no need for the Berlin Warburg to move about, for there were others who represented him.

Dr. Levin gave his sanction for the shifting of the center of Jewish gravity from Berlin to America, and "as early as August 30, 1914, a month after the outbreak of war, an extraordinary conference of American Zionists was called in New York."

What this change of seat meant, has formed the subject of much discussion. In 1914 the Jews apparently knew more about the probable duration of the war than did the principals. It was not to be a mere excursion through Belgium, as some fancied. There was time to dicker, time to show the value of certain Jewish support to the governments. Germany gladly pledged the land of Palestine to the Jews, but the Jews had already seen what Wilhelm had done in that ancient State when he enthroned himself on the Mount of Olives. Evidently the Allies won in the contest of making promises, for on November 2, 1917, when General Allenby was pushing up through Palestine with his British Army, Arthur James Balfour, the British secretary of state for foreign affairs, issued the famous declaration approving Palestine as a national home for the Jewish people.

"The wording of it came from the British foreign office, but the text had been revised in the Zionist offices in America as well as in England. The British declaration was made in the form in which the Zionists desired it, and *the last clauses were added* in order to appease a certain section of timid anti-Zionist opinion." (Guide to Zionism, pages 85-86.)

Now please read the declaration and note the italicized clauses just referred to:

> "His Majesty's Government view with favor the establishment in Palestine of a national home for the Jewish people and will use their best endeavors to facilitate the achievement of this object, *it being clearly understood that nothing shall be done which may prejudice the civil and religious rights of non-Jewish communities in Palestine, or the rights and political status enjoyed by Jews in any other country.*"

Zionist Jews Compel Western Jews

ZIONISM is of particular interest, not merely because of the quarrels which have arisen among the leaders over money—it is the war of "interest" against "capital"—but also because of the light it throws on the two great armies of Jews in the world, the way in which they use their power where they can, and the trouble that always embroils the nations which become Jewish tools.

People sometimes ask why Jewry, which is capitalistic, should favor Bolshevism which is the announced enemy of capital. It is an interesting question. Why should a New York Jewish financier, an officer of the government of the United States, help finance a "Red" publication which even our tolerant government cannot stomach? In addition to the fact that it is only "Gentile capital" that is attacked, the answer is that the Jew who has fallen for the worship of the Golden Calf is anxious to keep in the good graces of the Jew of the East—the Mongolian Jews—who are rampaging against orderly systems of society. It is quite useful when there is a revolution in Paris to have the 600 houses which you may own spared by the incendiary mobs—as were Rothschild's houses. Zionism has been one of the subjects upon which Western and Eastern Jew can unite. Indeed, it was the Eastern Jew that compelled the Western Jew to take a favorable stand on this matter. The Jewish gentlemen who are receiving the freedom of our cities today in their various aspects as "German" and "British" scientists are Eastern Jews. They have come to a contest with the Jews of America on the question of Money. The Jews of America have smothered some very ugly charges. The Jews of the East, more recently of Germany or England, are not likely to be browbeaten by the moneybags of Jewish New York, for *the Eastern type of Jew knows of a situation in which money is the most useless thing in the world*—and that is why he is feared and favored by Western Jewry of the Golden Calf.

The Jewish defenders are just now capitalizing the "split" in Jewry. The real split in Jewry will come when Jews of vision begin to support the attempts which have been made to liberate the Jews from their leaders. This internal squabble means nothing but a squabble of leaders; but when the Jews themselves divide, one side for twentieth century light and the destruction of the class power of selfish leaders, then may we look up hopefully. When the Jew recognizes the honesty of his critics and the righteousness of what they charge, then will there be a "split," but not before. The division in Jewry as evidenced by the contempt of the revolutionary party for the financial party, and as even more strongly evidenced by the fear of the revolutionary party by the financial party, is being brought about by the insincerity of the Western Jew's Zionism. The Western Jew says that the United States is the Promised Land, profits and interest are the "milk and honey" and New York is Jerusalem; the Jew of Russia has another view.

A knowledge of Political Zionism is worth while also as an authoritative illustration of what the Jew does when he is in power. Heretofore there has been Russia to illustrate this, but now there is Palestine. With every fact against them, with every traveler and observer giving them the lie direct, there are still Jewish spokesmen and poor befuddled "Gentile fronts" who insist that Bolshevism is not Jewish and that Russia is not now governed by Jews. It is just this constant denial of facts, this failure to use their opportunity to be honest, that is going to be the judgment of Jewish leaders. Bolshevism all over the world, not in Russia only, but in New York, in Chicago, in New Orleans, in San Francisco, is Jewish.

Palestine as a Mirror of Jewry

HOWEVER, there is no need further to insist upon that, except occasionally to add confirmatory illustrations of it. More to the present point is Palestine. It will be very difficult for the most irresponsible Jewish spokesman to deny that Palestine is Jewish. The government is Jewish, the plan of procedure is Jewish, the methods used are Jewish. Does anyone rise to deny that? Scarcely.

Very well, Palestine will do to illustrate the genius of the Jew when he comes to power.

Professor Albert T. Clay, in the *Atlantic Monthly* (will anyone declare that this long-established and thoroughly respectable Boston publication is "anti-Semitic"?) warns us that the information about Palestine which we receive in America comes to us through the Jewish Telegraph Service (which is the Associated Press of world-wide Jewry) and the Zionist propaganda. "The latter," he says, "with its harrowing stories of pogroms in Europe, and its misrepresentations of the situation in the Near East, has been able to awaken not a little sympathy for the Zionist propaganda."

This propaganda of pogroms—"thousands upon thousands of Jews killed"—amounts to nothing except as it illustrates the gullibility of the press. No one believes this propaganda, and governments regularly disprove it. But the fact that it continues indicates that something besides facts is necessary to keep the scheme going.

In Jerusalem, as this is being written, martial law is proclaimed. There has been a struggle between the native inhabitants, whom the Balfour declaration sought to protect, and the new-come Jews. As in the famous Easter disorders of last year, the wounded in the hospitals show that the Jews were armed and the natives fought with whatever weapons they could find on the spot; the conclusion of all impartial observers under the circumstances being that the Jews prepared for and sought the fight with unprepared natives.

Zionist and Bolshevist Rule Compared

THE mark of disorder perpetrated by the Jews is all over the place, the "persecuted" turned persecutor, and lest this should be charged to the general wildness of the people in Palestine let it be said that the rioters were only expressing in deeds what cultivated American and English Jews have expressed in words—namely, that the lawful inhabitants of the land ought to be driven out, in spite of governmental promises to the contrary. One of the first Easter rioters, Jabotinsky, whom the British authorities sentenced to 15 years in prison, was released immediately upon the arrival of Sir Herbert Samuel, and is now traveling in state, and is talked of as a possible successor to Sir Herbert, although he is originally one of the Russian Bolsheviki come down to practice the gentle arts of that tribe in Palestine.

The government is Jewish. Sir Herbert Samuel, is High Commissioner, representing the power of the

VOLUME two of this series of Jewish Studies is now off the press. It is entitled "Jewish Activities in the United States," being the second volume of "The International Jew." Twenty articles, 255 pages. Sent to any address at the cost of printing and mailing, which is 25 cents.

British Government which holds the mandate over Palestine. The head of the judicial department who appoints the judges of Palestine is a Jew. Christian or Moslem judges who do not give the Jews a shade the better of the proceedings are ousted—a condition not unknown in New York. Chaim Weizmann is head of the department of works—he is a Jew now traveling in this country and having the polite lie passed to him occasionally by Judge Julian W. Mack. In fact, at the heads of all the departments are Jews, a former New York Jew being head of the department of immigration, who has made splendid rules for the protection of Palestine from an undesirable class of Jews, rules so well adapted for the purpose that if the Congress of the United States should adopt them the cry of "persecution" would girdle the world.

It is to be noted that the Jewish government of Palestine is very much like that of Russia—mostly foreign. Trotsky came from the East Side of New York. A gentleman recently released from Bolshevik custody told the writer that the governor of his prison was an ordinary Jew who formerly lived on Fourteenth street, Detroit. Practically every big American city is represented in the Bolshevik government of Russia. There is another full-fledged government waiting in this country for service wherever necessary.

The methods being adopted to get the land are such as will fill the world with indignation once the world fully understands what is being done. And that it is done with the knowledge and approval of the Zionist Commissioner is indicated by the fact that he suspended the activities of the British officer who endeavored to stop the abuse. It was the old game of lending money at an exorbitant rate of interest to people hard pressed by war and crop failure, and then seizing their land when they could not pay. The bank that did this was the Anglo-Palestine Bank, a Zionist concern. This British officer, to save the people and the land, made arrangements with a British bank to lend them money at 6½ per cent, with five years to pay. If payment failed, the land was to go to the government for redistribution, not to the Zionist bank. This was the humane plan which the Zionist Commissioner forbade, whereupon the British officer resigned. Some effort was afterward made to redress the terrible act, but there it stands as the well-considered action of Jewry in power.

Jewish Pressure on the People

THEN follows what is described by every impartial observer as an "arrogant" attempt to expropriate everything in sight. In Russia it could have been done very easily under the plea of "nationalization," but there was Great Britain whose laws do not condone theft. The only schools that have been established in Jerusalem have been built and manned by the so-called "Gentiles," although the Jews of Jerusalem have been the pensioners of world-wide Jewry for centuries. As long ago as 1842 Dr. Murray M'Cheyne noted that the Jerusalem Jews cared nothing for schools because their children were only growing up into pensioners too. But Christians, with a warm regard for the Holy City, set about to improve the miserable condition of the Jewish inhabitants, and thus it came that at the time of the Zionist invasion a considerable number of Jewish children were in attendance at the schools. The newcome Zionist leaders demanded that the best of the schools be given up to them. Of course, this was refused.

"The Council of Jerusalem Jews" then caused it to be published in the Hebrew daily that parents who did not withdraw their children from the schools would be punished. And now look at the typical punishments threatened:

If any parent refused whose name was on the list of the American Relief Fund, the relief would be withdrawn. An interesting bit of news to subscribers to that fund.

Doctors would be forbidden to visit the families that had children attending the enlightened schools.

Their names would be sent to the blacklist at the places where circumcision was performed, so that newborn descendants of the recalcitrants might be refused the rite of Moses.

They would be denied all share in Zionist benefits or funds.

If they were in business, they would be boycotted.

If they were workmen they could get no work.

"Anyone who refused, let him know that it was forbidden for him to be called by the name of Jew. They will be fought by all lawful means. Their names will be put upon a monument of shame and their deeds made to reproach them to the last generation. If they are supported, their support will cease. If they are rabbis, they will be moved far from their office. They shall be put under the ban and persecuted, and all the world will know that in this justice there has been no mercy."

It is the Jewish Bolshevist spirit all over again, that spirit which so many people have been vainly endeavoring to reconcile with the Russian temperament—because it is so un-Russian.

It is tyranny, and not the tyranny of strength, but of meanness and darkness. It is now perfectly clear what was meant by Dr. McInnes, who is Anglican Bishop of Jerusalem, when he said: "The emigrants so far brought in (to Palestine, under the Commission) did not include many respectable English Jews; but they did include a great number of Russians, Poles and Rumanians, many of them thoroughly Bolshevik in their attitude to the government."

If this spirit obtains at the beginning of a movement which the Christian world has been taught by propaganda to regard as a profoundly religious and respectable exodus, it burdens the imagination to forecast what will be done in a period of full and unquestioned rule.

Meddling With World Politics

OBSERVING and weighing the events and tendencies of Jewish rule thus far in Palestine, it is not difficult to see the purpose in it all. The Jews still distrust their ability to make a State. They do not distrust the world's willingness to let them have a State; indeed, it is amazing how naturally the Jews place confidence in that portion of the world they have always affected to despise. But deep-seated in the Jew is a distrust of himself. He doesn't know how his people will contrive to live together. He doesn't know how they will contrive to drop the principles and practices which are so destructive of social comity elsewhere. And he feels that, patient as the mandatory power may be now, it is doubtful how long that patience will hold out under the blunders and brutalities that will be inseparable from Zionist rule, if any deductions can be drawn from the facts at hand. Therefore, feeling that the time may be short, he is endeavoring by such actions as interference with the cultural question, with the racial rights of the natives, and by such schemes as the land-grabbing device described above, to get so strong a hold on the situation as will seriously complicate it whenever Great Britain shall feel it to be her duty to the world to step in and attempt to bring some kind of order out of the chaos.

It begins to be very clear that Jewish nationalism will develop along the line of enmity to the rest of the world. Already the dangerous proposal has been made to organize a Jewish army for the protection of the Suez Canal. Instead of thinking of roads and farmsteads, of vineyards and oil presses, of schools and sanitary villages, the Jews are thinking of elevating themselves into the military power that shall stand between East and West on that most strategic strip of ground in the world. The whole situation is fraught with danger, and men who wish well to the Jews are alarmed and saddened by the prospect.

There are three elements of danger in the situation as it exists today: the overwhelmingly predominant Bolshevik element that is being poured into Palestine; the intense, egotistic and challenging nationalism that Zionists exhibit even before they get a potato patch—the taste for world politics and world power; and the racial confusion which now exists in Palestine.

These combined are dynamite. The first is more vital than many realize. Already the Jews who have gone to Palestine at great sacrifice and for pious reasons are complaining that instead of the Psalms of David the people are singing songs of the Red Revolution, and instead of meeting for instruction and prayer there are riotous gatherings extolling Trotsky as Messiah and the Soviet as the kingdom of heaven. On the third anniversary of the Jewish Revolution in Russia, the streets of Jerusalem were placarded with sentiments of blasphemy and treason, and May Day this year was devoted to the exaltation of anarchy.

"Judah Shall Fight Against Jerusalem"

THIS fact will be of interest to students of prophecy. It is as certain as any human forecast can be that this sort of thing will not be permitted to go forward in the face of the world. It is unimaginable that the nations responsible to humanity for the conduct of that important strip of territory will remain supine while Bolshevism spreads under the false pretense of a religious movement favored by Christendom. An attempt will be made to stop it. The Jews of Palestine will turn on their sponsor nation. The Jews of Russia will come down to help. Great Britain and perhaps the United States will defend the old pure vision of a Jerusalem redeemed. Then will come to pass the prophecy of Zechariah:

"And Judah also shall fight against Jerusalem."

Judah also! It is a thought to make a Jew bethink himself where the lawlessness of the East and the materialism of the West will lead him. Against Jerusalem! What a terrible ending of Judah's present mad delusion.

Palestine has been called the center of the earth. It is. The power that controls Palestine controls the world. Although exercising no sovereignty over the land itself, Great Britain's control of adjacent waters and of Egypt and Persia and India, forms the key of her power. The White Race has thus far been the Chosen People to whom the dominion of the earth has been given. Palestine is the key to world military strategy and trade. In question 12 of the Questions and Answers published by the department of education, Zionist Organization of America, this occurs:

12. What are the commercial possibilities of Palestine?

The location of Palestine *between the three continents* favors foreign trade.

All this lends itself to dreams of future glory, and many Christian friends of the Jew have pleased themselves by conceiving an universal Hague at Jerusalem and a new social order going out to bless the nations from Zion. It is the idea conveyed by men like A. A. Berle in books like "The World Significance of a Jewish State." All this might be expected if the Jews of today were Old Testament people, anxious to re-establish the social laws of Moses which are conceded to be the best safeguards ever devised against pauperism on the one hand and plutocracy on the other. But Palestine has not fallen into the hands of that sort of Jews. Before the dream can be fulfilled Judah must come to himself, as he has not yet, for from of old the Word is—

"And Judah also shall fight against Jerusalem."

The racial situation in Palestine just now is very delicate. Americans do not understand it. The Zionist propaganda has always been accepted on the assumption that Palestine is the Jews' land and that they only need help to go back. It is an historical and political fact that Palestine has not been the Jews' land for more than 2,000 years. There are in Palestine 500,000 Moslems, 105,000 Christians and 65,000 Jews. The industry of the land is agriculture. Engaged in this are 69 per cent of the Moslems, 46 per cent of the Christians, and 19 per cent of the Jews. Neither numerically nor industrially have they held the land. Yet, as the result of a war bargain, it is handed over to them as regardless of the native inhabitants as if Belgium had been handed over to Mexico. Many of the natives are Semites, like the Jews, but they do not want the Jews among them.

That is a strange fact for those who use the term "anti-Semitism"; why do real Semites also dislike the Jews? Surely Semites are not victims of "anti-Semitism."

The Disregard of Mandate Promises

THE Balfour Declaration, as well as the terms of the Mandate adopted at San Remo, recognized the rights of the native races. Indeed, everyone who knows about the people who have been native to Palestine for 2,000 years recognizes their rights, everybody except the Jews. Bethlehem was a Christian town, as befits the birthplace of Christ. Yet the Jews have contrived that 2,000 Bethlemites leave Palestine rather than submit to what they see coming. The other races are not so placid about it, hence the trouble. It is now that the last clauses, added as the Zionist historian declares, "in order to appease a certain section of anti-Zionist opinion" begin to get a meaning for the reader. Was the purpose only to quiet disturbing questions until all the arrangements were made? Evidently. It was then a dishonest appeasement! Such may have been the Zionist's intention, but no one need expect perjury on the part of the responsible nations. The end of the matter will see those last clauses redeemed by honest application of their terms to the people involved.

General Allenby promised those native races of Palestine that their rights would be respected. So did the Balfour Declaration. So did the San Remo Conference. So also did President Wilson in the twelfth of his Fourteen Points.

But Judah says, "Let them get out!" "The last clauses were added in order to appease a certain section of timid anti-Zionist opinion."

Let them get out! says Israel Zangwill. "We must gently persuade them to 'trek.' After all, they have all Arabia with its million square miles, and Israel has not a square inch. There is no particular reason for the Arabs to cling to those few kilometers. To fold their tents and silently to steal away is their proverbial habit; let them exemplify it now." Aside from the falsity of using the term "Arab," there is the delightful Jewishness of it—let them give it up to us, we want it! Americans have been in their land less than 150 years as a nation, and there is China and Arabia or Siberia for us to go to if we should want to, but we prefer our own country, and so do the native races of Palestine, who have dwelt there for 2,000 years.

The watchmen on the towers of the world are alarmed at what seems brewing in Judah's geographical caldron.

Either Volume One or Two of *"The International Jew,"* 236 and 255 pages respectively, sent to any address upon receipt of 25 cents in stamps to cover printing and mailing cost.

Pocketbooks, Exports and Organization

By ROBERT J. THOMPSON

Former American Consul in Germany and England

> ***GERMANY recently won a large contract for the sale of steel railway wheels to Argentina in the face of keen competition with England and America. It should be noted that some bids, including an American bid, were lower than those of Germany. But the liberal offer of long credit and quick delivery by the Krupp firm of Essen, landed the contract.***
>
> —Chicago *Journal of Commerce*, April 19, 1921.

I PICKED up several beautiful ladies' purses in Leipzig one day, just before Christmas. It was on the sixteenth of December, a few years before the war, and I had to deliver my purchases to friends in Lincoln, Nebraska, in nine days. The next afternoon I was in London, and the following morning, moving out of Liverpool on board the Lusitania, off for New York.

While passing through London, I concluded that I would need two or three more gifts and, as my mind had been running on leather goods, I went into the London department store, (Whitely's) to look for more ladies' purses. I found a large assortment in the leather section, but could see nothing, in gracefulness and finish, like those I had bought in Leipzig. What they showed me were short, fat and extraordinarily conservative, it seemed to me, as compared with the delicate and refined things I had in my steamer trunk at the Euston station.

Now here's the point to this little preface:

I remarked to the salesman who was attending me: "The Germans have you beaten on this leather work about a thousand per cent!"

"You think so?" he answered.

"Think so!" I said, "Why, these things look to me as if they were made for the Victorian Age."

"No, we just got them in. They are Christmas goods. You'll be surprised when I tell you that everything on these tables came from Germany. They are made pretty much to order and are what our clientele demands in the way of styles and so forth."

Incidentally, I will say I got through to Lincoln on Christmas day and had dinner with my mother.

The next summer, in company with a friend from Chicago—the late Dr. Skiff, of the Field Museum, who was taking the cure at Bad Nauheim—I visited a near-by town, to be exact, Offenbach, in the suburbs of Frankfort, where they specialize in the manufacture of leather goods of all kinds.

By a bit of manipulation, we managed to obtain an invitation to go through one of the best-known factories there. It was very interesting. They employed some six hundred persons, all adults, and when we had passed through the establishment and were speaking with the son of the proprietor who had acted as our guide, he told us that they manufactured only for the foreign trade; in fact, exclusively for the English and colonial markets. This information was brought out by our particular admiration of an exhibit of table and desk etuis or stationery holders of most elaborate and ornate finish. I recall that the prices mentioned ran as high as $2,500 for single portfolios; extraordinary luxuries, they seemed to us.

On asking where these articles were sold, and saying we had never seen anything like them in America, this young man remarked that the entire line shown in that room was made for the West End of London; that the goods on exhibition in the room we had previously visited were solely for the Australian trade, and so on.

"How about the American market?" I asked. "We have the richest stores in the world."

"Your American tariff makes it impracticable for us to compete to any worth-while extent there."

And why not? We used to make the most out of propaganda of this nature to the effect that the Democratic party was being supported by the free trade interests of England. I began to reflect on the matter and figured it out something like this:

"Here are six hundred trained workers employed in this single factory. They represent a population of not less than three thousand people. These three thousand Germans must, if one analyzes the thing, receive their house rent, food, clothing, amusements, doctor's care, industrial insurance, savings and so forth, from the pockets of England and her colonies."

My vision shot back to the line-up of goods at Whitely's, which I had looked at the winter before in London. I could see the counters and cases of Melbourne and Capetown loaded with these German-made goods, the finest turned out, perhaps, in the world, and I said to myself: "This certainly is some system. I suppose this is what makes a nation rich."

Nor was I at all surprised to read in the papers, about that time, that the London and Chatham Railway had placed an order with the Borsigs of Berlin for several dozen high-class locomotives to use on their lines in England. Then, too, there was in Hannover, where I was consul at the time, an English engineer assigned to the inspection department of the Hannovrische Machinenbau Gesellschaft, which was executing an order for a large number of locomotives for the British India Railway Service; and so the business was moving in all sorts of directions all over the world. If my figures are not too far off, Germany's annual exports of chemical products, just prior to the war, were as great in value as the entire exports of steel products from the United States, and I believe that the United States Steel Corporation had already established its own line of freighters, with thirty or forty ships, to carry its products.

But aside from the inroads being made on the preserves of her English cousins, by organized and up-to-date Germany in the leather and locomotive lines, the most interesting exhibit of her export system was shown in certain lines of rubber manufacture.

For example, she went off to South America or the Congo to buy her raw rubber, shipped it up the Atlantic to Hamburg and Bremen, say a matter of ten thousand miles; then overland some hundred and fifty miles to Hannover, where it finally became the finished product. Then these rubber goods were sent once more across the Atlantic, to New York, Philadelphia and as far as San Francisco, to reach which places they had to surmount a customs tariff handicap of 35 per cent to come into the hands of the American consumer. They did all that; and the final wonder of the thing was that those Hannover rubber companies were not only paying dividends to their stockholders as high as fifty per cent, but were laying up surpluses of very healthy sums. (I might add that the big rubber companies of Germany had founded settlements and great plantations of their own in Africa at this time.)

How could they do it?

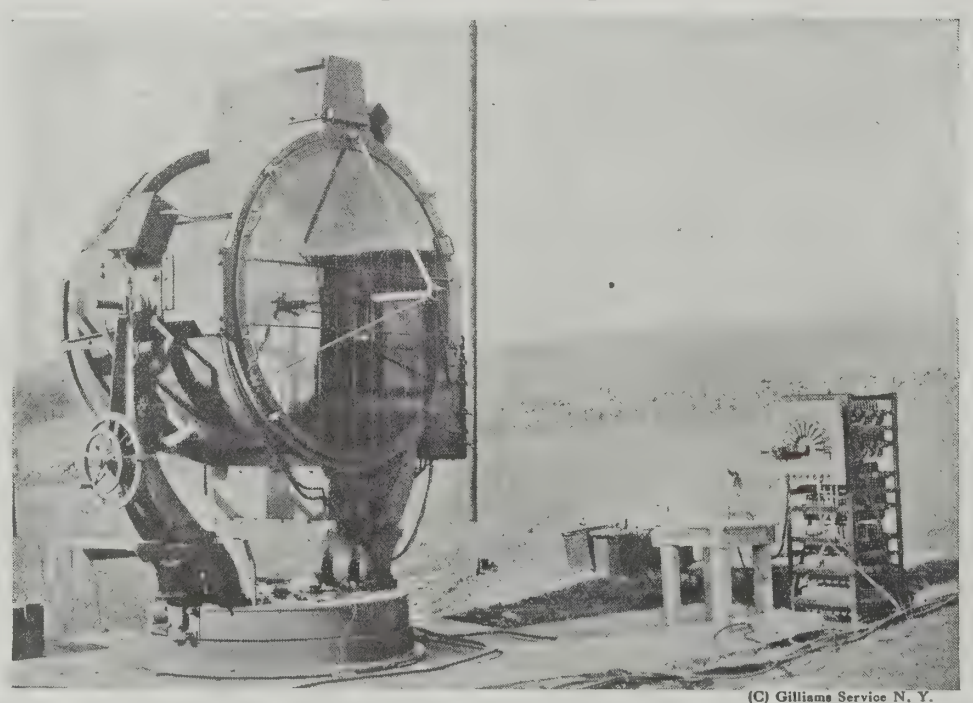
I often wondered as to the secret of their successes, and aside from certain valuable technical advantages of business policy, such as (a) adjustment of credits to the conditions and demands of the purchasers (long term credits), (b) special and elaborate preferential freight rates, on the Prussian railways and the steamship lines, I came to the conclusion that Germany's success in the export field rested chiefly upon (c) the stability and highly satisfactory status of her laboring classes.

This is a difficult matter to elucidate, for the reason that we judge the standard of working people, as well as others for that matter, from the standpoint of wages received. In my judgment, this did not apply to the German workingman—in Germany. It seemed to me, and I believe it is a fact, that the Geman mechanic or factory employe, could get more out of life (in Germany) on his $10, $12, or $18 a week than could be secured from double these amounts, or perhaps for any conceivable wage, in England or the United States. I will just give a few illustrations: He could get his street car transportation to or from his work for from 1¼ to 2½ cents; sanitary housing (under control of sanitary police) for from $5 to $12 a month; music of good quality afternoon and evening if he wished in the saloons and gardens without cost; and first-class beer for two and a half cents a glass. He could take his wife and family of three or four children to gardens or halls on a Sunday or holiday, and spend the whole day with music, games, song and conversation, and altogether his day's outing might cost him fifty cents, or at most a dollar. He could go to the Royal Opera, if his tastes ran that way, and they did often enough, for 10 or 15 cents. There was an employer's liability law that gave him protection in his work. Litigation in the settlement of claims in this respect was hardly of record. And then, above all, there was the state-regulated industrial insurance, where he paid a few cents weekly, the employer paid the same, and the government stood a third portion of the cost. The accumulations of assets in this fund just before the war, were more than twice that of the combined assets of the three greatest life insurance companies of the world, the Equitable, Mutual and New York Life. They exceeded three billion dollars, mostly invested in city apartment properties, and this fund and system served as a protective mantle covering with its benign folds almost 20,000,000 workers of all classes.

These conditions permitted the manufacturer, who was figuring on a two or five years' campaign, we will say in the Argentine, a campaign which might involve long-time credits, special machinery, expert knowledge of the territory and so forth, to calculate with safety on his labor problem, where such would not be the case with the American or English manufacturer.

Through the extraordinary care and development of the great economic force of productive labor on the part of the German nation—(due to the "Real Politiks" of the Social Democratic Party of that country, real politiks meaning to promote only for that which is practicable)—the German workingman has very generally come to accept his status, with a certain finality, to don his workman's uniform when he enters the factory, and to speak without shame of being a worker or laboring-man.

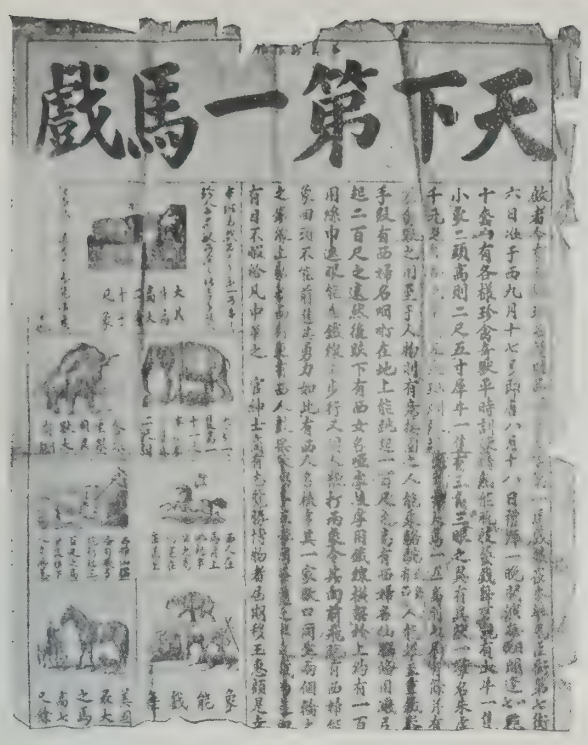
There is a noticeable absence in Germany of that silent, though apparent protest against his status, in the social economic scheme, which one may observe when watching the British workingman on his job. Fifty per cent, I should say, of these workingmen at the foundry puddling-pots, or at their machines, may be seen in dirty white shirts, hang-overs from the previous Sunday clean-up. These shirts will be covered with gunny-sack aprons or some improvised protection of nondescript character. You will be told that the British workingman is shiftless and improvident. My first thought, however, in making comparative studies of the English factory or mill worker, as against his German colleague, was very definitely that he was working under protest, and that his "gentleman's shirt," even if smeared with grime and grease, was the sign and proof of such protest.



Now when I speak of the German workingman donning his workman's uniform, I can best explain what I mean by saying that a visit to a German manufacturing establishment will disclose to you that practically all the workers are clothed in a manner suitable to their occupation; with jumpers, overalls or proper aprons; and when a factory is closing down at the end of the day, and the workers are coming out, they are dressed and cleaned ready to go to some garden, theater, or home as the case may be.

This simple difference in the outer aspect of the workers of England as compared with those of Germany, was a sort of final argument in my mind as to the stability of the German working class.

There has been no sudden change in the spirit and scheme of economic Germany. She has been, from the politico-economic standpoint, operating on the basis of state socialism for the past twenty years. True, the machine has heretofore been directed by the capitalistic individualistic class, and with unprecedented success. The only change, however, to record now is that the same institution, still intact, is being run or has been run since the revolution, not by the "vons," "junkers" and so-classed aristocrats, but by the Socialist leaders.



The same marvelous preferential freight tariffs (comprising not less than 1,000 different schedules, calculated solely to build up the special industries of the country) exist; the cartels for the control of prices are intact and strengthened; the state railroad system and inland waterways are functioning. For my part, I can see no reason why the country will not again shortly be overridden by commissions from America and England and other parts of the world to try and find out "how the Germans do it."

The World's Largest Searchlight Just Finished

(C) Gilliams Service N. Y.

It has 500-million candle power and is to be the Liberty Light of the Golden Gate, as it will be installed on Mount Tamalpais, near San Francisco. The searchlight weighs nearly three tons, is ten feet high and has a 60-inch lens. Its beam will be seen at sea a distance of 70 miles. You could read a newspaper by its light ten miles away, or light your cigar with it at a distance of ten feet. W. D. A. Ryan, the famous illuminating engineer who lighted the Panama Pacific International Exposition, first suggested the use of the light to stand as a sentinel at the Golden Gate. The picture shows the light connected to a switchboard the same as it will be when installed.

Photograph of the last piece in existence of John Robinson circus "paper," printed in Chinese. It had been folded and laid away for nearly thirty years. This paper was used in the Chinese quarters of large cities. Chinamen are great circus goers, but after a drunken boss hostler cut off the cue of a Chinaman in 1892, in San Francisco, Chinamen all over the United States boycotted the "Governor's" Show. The paper is yellow with black lettering.

"Cutting Up Old Circus Money"

The "Governor" Himself—By HARRY BARNET

NOTE—It so happens that "Governor" John F. Robinson's last activity was the relating of the stories which end with this, his reminiscences of the pioneering circus life of America. The concluding story by Mr. Barnet was in type when word was received that the old circus man had died at his winter home in Miami, Florida.

A VERY dear old lady, who lives in Birmingham, Alabama, has written a letter to me. "You can't imagine how much I enjoy your 'Governor' Robinson stories," she states in that letter.

"Wasn't he 'some boy'?" she unexpectedly went on to say in slang. "Many, many years ago, we lived near Seventh and College streets, in Cincinnati, and I knew him and his family. The home was on the corner, and the animals were quartered during the winter in a building on College street, right back of the home. That place always seemed like fairyland to me—the pretty wagons, and the wild animals, and especially the appeal that circus things have to wondering small children.

"Then, sixty-six years ago, I went to school in Hyde Park, not a great way from where the Robinsons later established their winter quarters in the 'Little Miami River country,' that you speak of. I think it was a good choice, for that is beautiful country. We have many recollections of its beauties.

"But before you quit writing about him," she concluded, "won't you please tell us something about the kind of man the 'Governor' is?"

And from St. Louis recently came an appreciative letter from another very dear old lady. She, also, is deeply interested in the stories that so far have appeared in THE DEARBORN INDEPENDENT, and she asked me to write a character sketch of the "Governor."

Well, this is the answer to these two letters, and in making this answer I believe that the best plan to follow is to set down here some things about the "Governor" as I have observed them, and a great many other things about his ambitions and ways of thinking in the language in which they were told to me by the man himself.

In many ways, the "Governor" is a contradiction. That is, he is not the sort of man you may think him to be, if you've pictured him to be anything like the impersonations of circus owners that you've seen on the stage, and in motion pictures. Neither is there anything about him that is suggestive of the cartoons you may have seen of circus proprietors. "Governor" Robinson is precisely like any other successful business man, plus a few notions and quirks that are the outgrowth of the things that he has seen and done.

For you must remember that he was not always a master circus mind. At one time he was a human baby, who opened his eyes nearly eighty years ago upon a world that to him was made up of a collection of scraggly wagons; wild beasts encaged in small dens painted precisely alike (for in those days, the "Governor" says, each show adopted one color for its wagons, and no other show used the same tint); and a troupe of what we might name as itinerant entertainers; that made up his father's circus. And that environment surrounded him during his boyhood, and through manhood, until he spent seventy years in it as a circus performer and owner. Of course, since the 1870's it was a very much enlarged and embellished aggregation. The "Governor" then owned it, and for fifty years he "toted" it over and about the country. Then he passed it on to his son, and it was finally sold to strangers, who took the name and good will of the aggregation along with its wagons and paraphernalia. Three generations of the same family owned the same show; the "Governor" was the connecting link between the first and the third, so that he is bound to be somewhat eccentric.

Noted playhouse erected by the "Governor" for his children at the winter quarters.

Physically, the "Governor" is a man of medium height, heavy set, and bald.

"I've got no hair on my head," he said one day, "because a consumptive old white bear died one Sunday when we boys with the show had a lot of time on our hands to get into mischief.

"We were crossing Lookout Mountain one Sunday morning on our way to Trenton, Georgia," the "Governor" continued. "I was a very small boy. In the menagerie we had an old white bear that had been declining for a long time. Just when we reached the top of the mountain the bear died. Now, we boys with the show had always heard that bear's oil made the best hair oil, and as a white bear cost so much more money than an ordinary bear, we thought that its grease ought to be just that much better than the oil of any other bear. If he had been a common bear we would have paid no attention to him.

"So we skinned him, and got all of the marrow out of his bones, and boiled it with the little fat that he had left on him. I guess we got a little vial of oil for all our trouble. And I remember that we hunted around and got a lot of wintergreen, and perfumed the oil with it.

"Well, we used that oil, and shortly afterward the hair came off my head. I have always thought that the white bear's grease did it, and that there was a curse on it, or something like that. You know, there always was a lot of superstition in me, and I've got a good deal of it left.

"Now, I'm an old man, and so far I've been through the world in a way that I believe no other man ever went through it," he went on without a pause. "But I've never done a good many of the things that most people think a circus owner naturally does, and I've done a good many things that most people think he never naturally does.

"For instance, I never saw a game of faro bank. No man ever saw me in a gambling house. I never gambled for anything more than a cigar. And I never have seen a professional game of baseball, nor have I attended more than two or three horse races. And I never drank liquors, except a little wine when I was a young fellow, although liquors always were before me. Everybody with the show carried whisky, and I was always welcome to a drink of it. Pa often told me that I could take a drink whenever I wanted it. But I never did it. I saw too much of the effects of liquor drinking. Liquor was no new thing to me; and it wasn't forbidden to us boys with the show. So I had no curiosity about it. But if pa had refused it to me, and had aroused my curiosity that way about it, I suppose I would have drunk it, because I would have thought it the manly thing to do.

"And we were very strict about town people drinking, or bringing intoxicants to sell, on the lot. However, they did it whenever they got the chance to do it. And that practice was one of the things that we had to contend with in the old days—men would open regular saloons on the show lot, or near to it, on show days. It caused us a lot of trouble, because too many men got drunk, and started 'hey rubes.' Finally, I issued an order that no liquors could be sold on the lot by any one; and when men started to sell on the streets or any place very close to the lot, except in saloons, I always put a stop to the traffic by sending some of my best fighters there to clean out these places.

"So you can imagine my surprise one day, just after the Civil War, when a man drove a two-horse wagon on the lot in a small Indiana town. He had at least half a dozen barrels—not kegs, but barrels—of beer in the wagon, and he proposed to sell it to the crowds waiting for the big show to open. Well, I saw a whole tent full of trouble if these people drank that beer. They would get drunk, and start a dozen fights that we would have to put a stop to, and maybe somebody would be hurt or killed.

"I went up to this man, and told him that he couldn't sell that beer on my show lot.

"'Who says I can't?' he replied. 'I got a permit from the owner of this here show grounds to sell beer here, and whisky, too, if I want to, and a state and a town license. I don't reckon I need anything else to sell it.'

"He showed me the permits. I was helpless then, but from that day on I had a clause in my contracts for show lots giving me the privilege of ousting every liquor vender who tried to open a shop on my lot.

"Then it was up to me to get rid of this fellow in some other way. One of my men said he would do the job. He went up the street, and got a big vial of croton oil. Then he got some fellow who was in the confidence of this beer seller to talk to him. Finally, this beer man asked the town fellow to watch the beer while he unhitched and unharnessed his horses, and tied them to a wagon wheel. While he was doing that my man went to each barrel, and put enough croton oil in it to give character to the beer.

"When the beer man came back he invited everybody to have a drink with him as a starter for his business. He was a big, jovial sort of fellow anyhow, and a lot of these people did drink with him. A lot of my men went up, but they took the beer and only pretended to drink it. Of course, nobody else knew about the trick, and the country people were ignorant of what had taken place. Well, there was no more beer sold out of that wagon that day."

Despite the fact that "Governor" Robinson occupied a place in the amusement world that no other man yet has filled, he is without doubt a disappointed man. He would much rather have been an army man than the greatest of circus executives. This ambition has led him to accumulate, and thoroughly to study for many years all the books he could buy that tell the story from cause to effect of each war in which the United States has been engaged, even to insignificant Indian wars. I seriously doubt whether there are many private libraries in the United States that contain such a collection of war books.

This love for the military cropped out in every interview that I've had with him.

"When I joined the navy I was assigned to the command of Admiral Porter," he began one afternoon, "as an ensign. Well, I never had known discipline, and I innocently got myself into a lot of scrapes when I felt awfully cheap. But the cheapest I ever felt while I was in the navy didn't have anything to do with discipline. I was mistaken for a Jew—either that or maliciously taken for one.

JOHN F. ROBINSON,
Viewing the parade a few years ago. This is one of the most characteristic pictures of the "Governor" ever taken.

"Along in the winter of 1863, we were trying to get in the rear of Vicksburg, and one night we tied our gunboat in front of the plantation of Governor Sharkey, I believe his name was. He had hundreds of bales of cotton piled up a mile or two back from the landing. Next morning we captured several ox and mule teams, and plantation wagons, and went out to get a bunch of this cotton. I had charge of the train of wagons.

"There were several young daughters at the big house, and some other young ladies also there. They were out on the porch as we went by, and a young officer from our boat was there talking to them. They were very pretty and nice young ladies and, of course, I was inclined to be a little on the flirt, or the mash, or whatever you want to call it. As we went by the house I kissed my hand to them.

"'Who is that young man?' one of these girls asked the officer.

"'Why, that is Mr. Robinson, from Cincinnati,' he replied.

"'Well, I declah,' she said, 'he is the first Jew I evah saw in the service.'

"Well, that took all of the conceit out of me, to be mistaken for a Jew. I had little side whiskers then, and a goatee, and a small mustache, and I shaved them off as soon as I got to the boat."

One of the peculiarities of "Governor" John F. Robinson is the fact that he treasures small memories. One of the pleasantest of all of them is the fact that he once was kissed by a President of the United States.

"I guess I am the only circus fellow in the United States that a President kissed," he went on to say, after pausing to light his cigar. "And it impressed itself so thoroughly on my mind that I can remember it as though it happened but yesterday.

"Zachary Taylor was on his way through Pennsylvania to Washington for his inauguration. There were no railroads in that section of the country, and the President-elect was traveling by carriage. He passed through York, Pennsylvania, the day we were showing there, and stopped for dinner at the same hotel where we stopped. Of course, the whole population wanted to see him, and he went out on the front porch of the hotel to make a speech.

"In getting out on the porch he had to go through the room occupied by my father and mother and myself, and in passing through I suppose I attracted his attention by getting in his road. I wasn't very old, and had long, golden, curly hair, and he remarked what a handsome boy I was. Old-manlike, he ended by picking me up and kissing me. I can see that man now, picking me up. And I can see him riding down the street. I had watched him come into town. He came in in a sort of a parade, accompanied by prominent citizens, a band, and the county militia, and went down the whole length of the street. Then he turned and came back to the hotel. When President Taylor left town I watched him until he got out of sight around a bend in the road. There was quite a cortege of carriages filled with prominent and eminent men of the country in the President's party.

"But speaking of Presidents," the "Governor" continued, "I've never smoked a cigar without a holder since General Grant's last illness. You know, the General was a heavy smoker, and I believe that's what killed him. If he had used a holder I believe he would have lived much longer."

The "Governor" paused to rummage through his humidor to get a cigar that exactly suited him. And that was a job requiring some minutes, for he was a bit cranky that day. It is a safe bet that the "Governor" has burned more cigars than any ninety-nine men out of a hundred. At the mention of his name, the first

(Concluded on page 15)

JEAN BAPTISTE LEMOYNE DE BIENVILLE

Records of French Rule in American Territory

A LAND rich in archives is a land rich in memories; and remembrance is the anchor of the state. Love of country, pride of country, faith in country, make heroes of that country's children.

In constitution, laws and race, a people are the succession of the institutions and the race preceding them. To know a people, one must know their ancestry; and to understand their institutions, one must understand their origins.—Extract from the speech of Henry P. Dart, of New Orleans, which resulted in the permanent preservation of 200 years of written history.

Unpacking History

How the History of Life in Louisiana Territory Is Being Put Into American English for the Future Generations

By HARRY H. DUNN

DOWN in old New Orleans, in that part of the city platted by the first of the French adventurers to enter the Lower Mississippi Valley, stands a square, brick-and-concrete building, known as the *Cabildo,* a relic of the Spanish régime in America. In that Cabildo, fronting on the historic Place d'Armes, once the center of life of La Nouvelle Orleans, lie 108 black iron chests, not unlike the chests over which the stage guards rested their rifles and their lives on western express routes of a little more than half a century ago. In these 108 black iron chests in the brick-and-concrete Cabildo, in the heart of ancient New Orleans, lie the only existent records of that vast area first known as the territory of Orleans, and later and more widely as the Louisiana Territory.

These records, written by hand in ink still as brilliant as the day it was penned, but on parchment and paper which is fast crumbling to dust, cover the period of French and Spanish domination, from 1699 to 1803; the territorial era, from 1803 to 1812, and the period of statehood, from 1812, with its gayly-flourished script, down to the prosaic, typewritten documents of today. In the French records lie the history of every Creole family in New Orleans; the story of every crime, from the theft of a bit of ribbon from a girl's hair while she walked in the Place d'Armes, to the murder of an official of the government; the record of every transaction, from the sale of a landing place on the river, to the freeing of a slave who had served his master 23 years; and often the "plain and simple annals of the poor," such as an order, issued by no less a personage than Jean Baptiste LeMoyne de Bienville, founder of La Nouvelle Orleans, to one plantation owner, directing him to deliver a "female Negro in good condition of health and body to her husband. . . . . since the man has worked seven years without pay, on the understanding that the woman is to be his at the end of that period." Thus does the story of Rachel and Jacob again leap to life from yellowed pages, scarred with ink made from the cuttlefishes of the Great Gulf a few miles away.

But all this detail of the life of more than two centuries past has been of little use to the world since Louisiana Territory became a part of the United States. The 108 iron chests have been stolen and returned, lost and found, once carried as far away as Illinois, during the Civil War—and yet, as if guided by some almost providential hand, they have been returned each time, until they found permanent resting place in the Cabildo, under the care of the Louisiana State Museum. Ever since the writing of the first volume, in 1699, these writings of the French and Spanish rulers of America have been waiting in silence, shut off from American students and historians, not only because they are written in foreign languages, but because the parchment on which they are written is so fragile that it can be handled only with the greatest care, and written in such old forms of both French and Spanish that only the rarest of translators—those born to both languages and equally familiar with English—can be depended upon to translate and transcribe them accurately.

But in these 108 iron chests are the detailed daily lives of the people of the Louisiana Territory of two centuries ago, such detail as is found in no other history in the world, detail which devotes a 60-page, handwritten pamphlet to the passing on——called "succession"——of the DeGruy estate, the DeGruys having been for a century and a half one of the leading families of the territory. Now, today, all this is being translated, word by word and line by line, and set down in typewritten English, to be published in book form and to be preserved forever as a vast storehouse—the only one in the world—of the life and actions of the handful of dwellers on the edge of the wilderness of the Mississippi Valley, the founders of an empire which eventually became a part of these United States.

The translation and transcription is being paid for by a resident of New Orleans, who has not allowed his name to be made public, and the cost runs high among five figures. The work is being done by two women, daughters of old Creole families of New Orleans, each born to Spanish, French and English—Miss Laura Porteous translating the Spanish documents, and Mrs. Heloise Hulze Cruzat, the French papers. Unfortunately, the Spaniard was not so immersed in detail as the Frenchman; consequently, the records of Spanish domination are by no means so voluminous, so detailed, or so clear as those of the French régime. The Cabildo, or advisory council to the Spanish governor, did not possess the authority held by the Superior Council which advised and aided the French governors. As a result, some of the Spanish governors, confronted with a court of inquiry in Madrid seeking information as to their acts in New Spain, either destroyed their records, or carried them back to the mother country, where they were lost.

With the passing of the Spaniard, the Frenchman came again, and, though Napoleon's representative, Colonel Prefect Laussat, had possession of Louisiana for only 20 days, awaiting the arrival of the agents of President Jefferson, he established a number of laws, and opened some problems in government which puzzled Jefferson and his agents, and all of which have not been settled even to this day. Racial, governmental and political questions arose when Louisiana came in as a territory of the United States, and, as a result, large numbers of the records of the French and Spanish periods were scattered all over the state, and many of them lost forever. Funds have been provided, by the same person who is paying for the translation, and a nation-wide search is now going on for these early records of the Louisiana Territory.

In them is told the verbose but tremendously interesting and important story of the slow operation of the legal and social machinery whereby French and Spanish people of Louisiana and their descendants became acquainted with and accustomed to American ideals of democracy and liberty; how they grew into American habits and customs; how they came to obey, even though they did not clearly understand, American laws and methods of justice; how they were weaned, and this was slowest of all, for the process is not even yet complete in New Orleans, from the languages of their childhood. Histories of that time tell of political happenings, but there is almost nothing printed concerning the domestic and social life of the period. Possibly these documents are lost for all time, but that the remaining 108 boxes never will be lost is now being made certain by two women, working every day over a long table down in the Louisiana State Museum, where once was housed the Cabildo of New Spain.

One of the most important discoveries made among these records is that, while it always has been believed that the Louisiana Territory when held by the French, was governed by the laws of France, and, while ruled by the Spaniards, governed by the laws of Spain, as a matter of fact, there grew up in this section a civil law entirely different in its basic principles, as well as in its application, from the laws of either one of the mother countries on the other side of the Atlantic. Louisiana even today follows some of the antiquated customs and forms then established in her judicial procedure, and her laws of 1921 reflect in no small degree those of 1700, especially in regard to matters concerning the family. In the days of the French and Spanish governors, laws were promulgated, as they are largely in the Latin-American republics today, by the posting of "decretos" in public places, but, prior to this posting, they were required to be written into the record books, and, after being written there by the "escrivenors" to be signed by the governor and his "commissaire ordenneur," with their great seals attached. Likewise the humblest act which came before any court of the colony, or was put up to the governor or to any of his deputies, had to be so written into these books. These form the contents of the 108 chests now being translated. Often the laws and legal proceedings of this colony of a few thousand souls for a year is greater in volume, even when translated and typewritten, than the proceedings of our national Congress for a session, representing more than 100,000,000 people. Thus it would seem that the territory was overburdened with laws, and over-eager to involve itself in lawsuits. It is estimated that at least five years will be required in the translation, possibly an even longer time will be needed, and steps are now being taken to add other translators to the work, if competent persons can be found, familiar with the ancient French and Spanish idioms and the old forms of writing.

So far—and the work was begun nearly one year ago—only three boxes have been opened and translated, the third being not quite completed. So expert have the translators become that they can take one of these old books, bound in heavy slabs of pig-skin, the pages fastened together with lacings of deerskin thongs, and handle the pages, stiff and brittle with age, until all has been translated, and not even a flake of the paper fallen from a sheet. Sometimes, where holes mar the pages, they must reconstruct sentences, in whole or in part, but so familiar have they become with the wording, the customs and the habits of thought of the "escrivenors" of two centuries past, that these two little women of the twentieth century write on and on and on, just as if nothing were missing from the flourished page before them.

And the most interesting part of all this translation which one day will be open to the world, is not the legal formulas, the orders of the courts, and the pronunciamientos of the governors of the territory. Seen through the veil of years in a glamour of history that is half tradition, it becomes rather hard to remember that these Louisianians of 1699 were merely human men and women, living lives of joy and sorrow, happiness and misery, prosperity and want. But it is as human beings that they live again their daily lives in these records. For instance:

The first marriage contract bears the signature of no less a personage than Jean Baptiste LeMoyne de Bienville, founder of La Nouvelle Orleans, with his great red seal, and likewise the three-palms, all gold, of the commissaire, Salmon. Romance breathes through its legal phraseology, for it tells of the marriage of Louis Menard, an orphan, with Catherine Marchand, also an orphan, both reared in the convent of the Ursuline nuns. A novel might be written on the story of these two parentless lovers, exiles in a tiny settlement on the verge of the wilderness, and brought together by the brave religieuses who dared untold dangers to spread their faith in the new land.

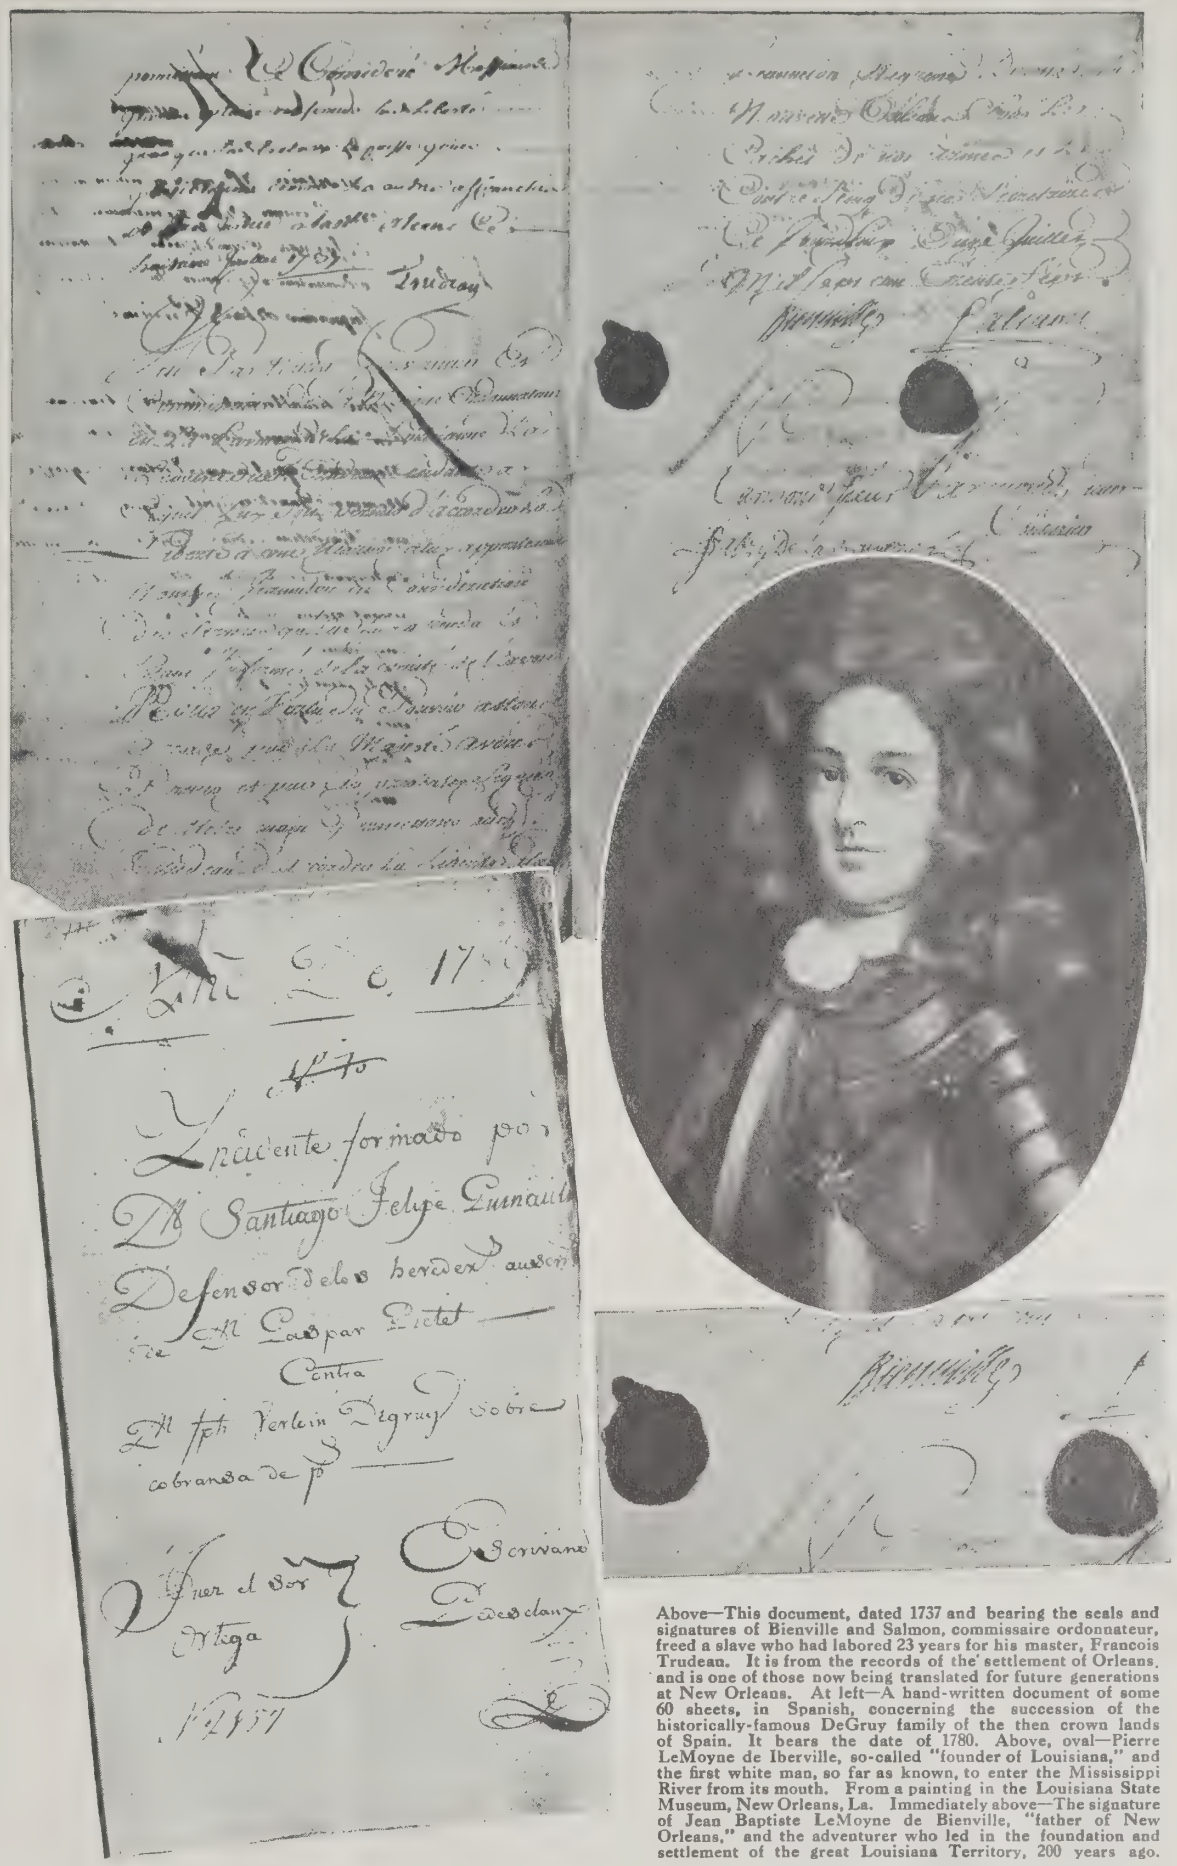
Indeed, the ancestors of many of the present-day dwellers in the land of the Creole and the 'Cadien were firm believers in marriage, for the records of both French and Spanish governors are filled with the "conventions" of marriage, remarriage and re-remarriage, to the third and fourth time. The men apparently lived longer—and thus married more frequently—than did the women in the territory of Louisiana. Under the petition for remarriage, the widow as well as the widower were involved, and it becomes plain that many of the men who remarried, chose widows for their second mates. It was a time of large families, and the records are full of long legal processes involving the division of property between "thy children, my children and our children."

One of the longest cases, which involves some 30 hand-written pages in the French series of volumes, is entitled, "Parishioners versus Parish," brought on when Father Charles, curé of the church of St. Louis, decided it was necessary to auction off the pews each year, because the church roof leaked, and it was needful to raise money to repair it. "Certain churchgoers," says the record, "objected to a sprinkling as they sat at mass every rainy Sunday, but Father Charles presented the argument that parishioners should take turn about sitting in the pews where the most rain fell." It is interesting to note that Father Charles finally had his church roof repaired, the money being furnished by the parishioners who "objected to a sprinkling."

Medicine in those days seems to have been a simple science. One court record shows an attempt to collect a bill for 80 francs—about $16—from the estate of M. Payon, decedent, by a surgeon who had attended several Negroes on the Payon plantation. The record shows the surgeon's bill in detail, including charges for "drugs, bleeding, visits," and frequent doses of "hipecac" and "astringent opiates." Today, the "several visits," without the "bleeding" or the "hipecac," would cost the estate of the rich plantation owner much more than eighty francs.

One of the most dramatic records, extending through seven or eight long documents, centers on a case from Natchez, then a far-away settlement on the Mississippi. F. W. DeKnepper, a notary of Natchez, brings this case to the attention of the governor, on September 2, 1727, nearly 200 years ago. By the document, Captain de Merveilleux, commandant of the post at Natchez, had to go to New Orleans on official business, leaving his affairs in the hands of a steward, one Pierre Gauilas, formerly a lieutenant in the army. Testimony of witnesses here begins to vary to such a degree that one suspects there was some influence exercised on each of them, but, eventually, after several trips between Natchez and New Orleans, the governor and the notary arrived at the truth, which is that a Negro, with the jumbo-mumbo name of Choucoura, fresh from Africa, had been terribly mutilated, losing the fingers on both hands, as the result of punishment inflicted by the steward. This steward claimed that the slave had defied his authority, and that, "for discipline, it had been found necessary to flog him." His wrists were injured by his struggles to escape, according to the steward, and after his punishment, he had plunged his hands into a kettle of boiling water, in "some savage form of remedy for the injury."

Witnesses for the prosecution, however, claimed that the man had been tied tightly by the wrists for five hours, and had been given 600 lashes on the bare skin. Mortification of the hands then set in. The outcome of the case was that on January 1, 1728, three months later, the steward, Pierre Gaulas, was ordered to pay "whatever shall be required above the auction figure, in order to secure 200 piasters in gold to Captain de Merveilleux, commander at Natchez, for injury to the Negro Choucoura." From the impersonal standpoint of 1921, one cannot but wonder just what the good governor, the judge and the notary thought there was left in life for the maimed Choucoura, victim of a system of barbarity worse than that of his own jungles, yet which he could not understand.



Flashes of humor glimmer across the pages of these ancient tomes every now and again, as, for instance, when Jean Baptiste Portier is whipped in the public square in 1720, for stealing three napkins from the home of Cartier de Baune, *attorney-general to the governor.* This order bears the signatures of such men as Bienville, Salmon, and the Chevaliers Dupuy and DeCoublant, names of power in the colony, who, it would seem, would have had other work to do than to sit at trial of a napkin thief.

Laws of church and state seem to have worked hand in hand in Louisiana Territory 200 years ago. There is a record which tells that Conde de la Pommeray, the king's treasurer, was fined 30 livres, and reprimanded, because he had buried *outside* cemetery walls the body of a Negro child who had been baptized. As the body of the child was entitled to rest in consecrated ground, the conde was compelled to disinter and rebury it in the cemetery.

There was no Juvenile Court, but runaways boys—no girls—appear now and again, as having been brought before the commissaire, after having fled from some tradesman to whom they had been apprenticed. There were no divorces, but there are applications of several wives for separation from their lords and masters, and permission to retire to a convent. In 1728, one Mme. Marie Magdelaine de la Tour, apparently stronger-minded than her sisters in the colony, petitioned the governor direct for an order directing her husband to "cease and refrain from dissipating his substance over the gaming tables, and thus wasting our joint property."

Neighbors quarreled and "made up," apparently about the same as they do today, and one volume is filled with records of such neighborhood disputes and the setlement made by the commissaire and the governor. The beginnings of feuds are told, some of which spread afterward into what are now the states of Mississippi and Alabama, and the extinction of more than one family is recorded through such battles. The books are not much of a record of good deeds, save in the distribution of lands, confirmation of titles, preservation of property, and such like works of a government imbued with at least some sense of its responsibility for the welfare of its people—yet through the whole historical story runs a dark thread, the tale of a people subject to its masters, rather than to itself.

Meanwhile, the same sun that shone two centuries ago on the periwigged Bienville and the armored D'Iberville, as they signed their names to these writings of the escrivenors, falls through the clouded windows of the same Cabildo, on the same writings, now being unraveled by two women, each the descendant of a family prominent beneath that same sun, in this same settlement, two centuries ago, so that those who come beneath that same sun, ten centuries from today, shall be able to know what happened in the Royal Territory of Louisiana at the beginning of the eighteenth century.

Above—This document, dated 1737 and bearing the seals and signatures of Bienville and Salmon, commissaire ordonnateur, freed a slave who had labored 23 years for his master, Francois Trudeau. It is from the records of the settlement of Orleans, and is one of those now being translated for future generations at New Orleans. At left—A hand-written document of some 60 sheets, in Spanish, concerning the succession of the historically-famous DeGruy family of the then crown lands of Spain. It bears the date of 1780. Above, oval—Pierre LeMoyne de Iberville, so-called "founder of Louisiana," and the first white man, so far as known, to enter the Mississippi River from its mouth. From a painting in the Louisiana State Museum, New Orleans, La. Immediately above—The signature of Jean Baptiste LeMoyne de Bienville, "father of New Orleans," and the adventurer who led in the foundation and settlement of the great Louisiana Territory, 200 years ago.

Lean Days for "Saviors of Our Country"

Concluded from page 2

however. A patriot must be perforce a diplomat, and now is his chance to prove it. Where is the diplomat who announces that he has a plan? It follows, therefore, that if the patriot lets any one suspect that he has a plan for saving the nation—blooey!

So, instinctively they murmur something about paying their respects, and even the toughest of the secretaries about, the most insensible and calloused unbeliever, has not the courage to deny that simple request, if it is at all possible to grant it.

Thus nearly all patriots may hope to see the President and shake his hand—but only once, because presidential hands can wear out and therefore everybody must have a chance at them. But between paying respects and buttonholing the President in a confidential aside the divergence is great. Moreover, there are so many patriots in line at times that no one of them would care to reveal his own plan where everybody, possibly a competitor, may hear and profit thereby.

The exiting is performed in various ways. Most patriots depart as if in a trance. They are prey of mixed feelings—hope, gladness, envy, irritation, animosity. They glow as they think of the tingling fingers which the President had enfisted in his—that love-at-first-sight feeling of the touch of the adored one—but they frown as they remember that the Big Boss heard nothing about the great plan, or the papers, even, and did not invite him to return for a smoke late in the afternoon, to talk it over.

"Maybe if I had voted for the other candidate," he mutters, "he would have treated me better!"

No wonder the Egyptians had a whispering gallery! They were more sophisticated, and knew the way of the patriot. When the Queen of Sheba headed a parade or Ptolemy presided at the corner stone ceremonies of the Knights of Ouephenes' combined temple and office building, how many Nihilists—for example, constituents with a voting precinct near the river—were itching to save Egypt?

The man in the White House two or three score of centuries later cannot dispose of fellow citizens as his ancient peers disposed of their subjects. He can't get away from them, and he must be on show once in a while. Twenty millions would go to him if they dared; two millions can't afford it; two hundred thousand will try; twenty thousand will succeed, and the first two thousand have already done their worst.

Washington today is an unfriendly place for patriot, patrioteer and jobseeker. It worked overtime in their favor during the war. But that's what consumes the new patriot. He, a Republican voter, is out, while the Democrat is in, laughing gleefully. As not infrequently he is in a place where he acts as buffer for Republican administration men whom he hopes to serve indefinitely. They kick against the insufficiency of the meal ticket, but even the mess of pottage looks good to them.

It looks good, too, to that vanguard of patriots who descended upon Washington and by the end of April and the first days of May, meteorologically drab and damp and cold, who presently began to find themselves facing something like thirty gates at the Union Station—facing them with their back toward the Capitol, which usually means that even patrioting has a limit.

Wholesome Agriculture—Prosperity for All

Henry C. Wallace, Secretary of Agriculture, Points Out in Interview Close Relationship Between Contented Farmers and Happy Country

AGRICULTURE is one of those terms that in print seldom attracts the attention of the urban reader, who little realizes that his indifference, sometimes not without a trace of contempt, is directed toward that very science that puts bread into his mouth. Agriculture is little understood by even well-educated persons who have been kept in ignorance about the very real meaning of dust-unto-dust. The humble farmer's calling has been humble perhaps during the last twenty centuries. Before then, however, it was venerated by the Egyptians, and hieroglyphics on ancient monuments always include the oxen and the farmer.

Any number of causes have united to alienate the average man's sympathy toward agriculture so that even during the most distracting days of the recent war his sense of security magnified the importance of every article except food, and it has since been generally admitted that the average city individual has forgotten the maxim that "food will win," whether it be war or prosperity.

During the last few months, generally termed the period of reconstruction, agriculture has been the first to suffer in the economic readjustment of the nation, and, despite a plentitude of foodstuffs everywhere, people are going hungry; hungry, not only in war-ravaged territories abroad but even in the United States and, as fate would have it, in those towns and cities which had received the greatest returns during the period of false prosperity. In one of the industrial towns, but not a boom town, the end of April saw hundreds of school children famished and even fainting.

Something, of course, is wrong somewhere. Whatever it is, either in theory or in practice, it seems that the people's attitude of indifference toward humble agriculture in favor of more meteoric and spectacular trades is fundamentally responsible for the unsatisfactory conditions existing today.

Nation's Prosperity Involved

REPLYING to a question submitted by the interviewer for THE DEARBORN INDEPENDENT, Secretary Henry C. Wallace, of the Department of Agriculture at Washington, said:

"The people of the nation must come to understand that our prosperity as a nation depends upon a prosperous and wholesome agriculture." Then he added: "People who are not familiar with agriculture find it hard to understand the situation; they refuse to take seriously what the farmers say concerning their troubles."

The interviewer found Secretary Wallace at his desk in every way "registering" as a man with a job ahead. This is different from a man doing his work—a distinction that is apparent at any capital where government activities are in full sway—or supposed to be. And Secretary Wallace, like a few of his predecessors, finds his way obstructed by a shortsighted Congress that is extremely liberal in appropriating funds for war purposes but inconsistently stingy toward agriculture.

The "first ninety days are hardest," is an old saying in Washington anent new administrators, but Secretary Wallace, judging by his statements, is sure that the time will be somewhat longer. The interviewer fixes it, in his case, at about ninety months.

Not a little of the inherent difficulties which he faces are those which involve educating all the people in considering the farmer's lot more intimately, just as they would figure the quality of flour or the richness of milk and the abundance of "ham and"—for all of which the farmer is to be thanked. The first step, therefore, is educational. And what Secretary Wallace says is interesting, too.

"We have come to a time in our national life when our agriculture must be put on a sound economic basis," he said. "This is imperative if production is to be maintained and our people are to be fed at reasonable costs. It is a matter of pressing concern to both producer and consumer.

Sales System Wanted

"IT IS a time to call in men who are qualified to study this problem in its larger aspects and map out a program which can be followed with benefit to all the people, and which will enable us to maintain this as a self-sustaining nation, agriculturally, industrially, and politically through the ages yet to come.

"If we are to make this a self-sustaining nation agriculturally, as President Harding put it in one of his speeches, there is no time to be lost in studying these great problems. It is not a question of production alone, it is a question of the farmer being able to sell what he produces at a price which will justify him in continuing to produce.

"We are the best producers in the world but our sales system is very bad indeed. We must study everything which influences both production and price. We must look into the matter of competition from farmers of foreign lands where agriculture is still being exploited and where the standards of living are very much below the standards which we demand for our people. We must look into world conditions both of supply and of demand and produce more intelligently and adjust our various crops to the probable needs. We must look into the administration of credit machinery. Those who control the finances of the country and who have it in their power to influence, either directly or indirectly, the extension of credit can exercise a large amount of control over the prices of farm products. The same thing is true of the administration of our transportation systems. Through the simple device of regulating the flow of cars, the prices of farm products can be sent up or down at the will of those who exercise such control. We had some costly experiences along this line during the war.

"People who are not familiar with agriculture find it difficult to understand the situation. They refuse to believe that the depression is as serious as it really is. They point to the high value of our land, to the high prices at which farm products were selling prior to the recent heavy drop; to the large number of automobiles owned by farmers; to the apparent wealth and comfort on every side; and they refuse to take seriously what the farmers say concerning their troubles.

What Struck the Farmer?

"I DOUBT whether the people of the East, for instance, realize just what has happened to the farmers of the producing sections. Farmers everywhere—the cotton farmers of the South, the rich farmers, the cattle and sheep growers of the Far West, the fruit growers—all are passing through a valley of discouragement and financial stress. Take the grain and livestock producing country of the Central West, which gives us our great surplus crops. We have the finest rural civilization, taken as a whole, the world has ever seen; our farmers average very high in intelligence; they produce more per man than almost any other farmers in the world; they have adopted the most advanced system of extensive farming yet developed. Notwithstanding all this, they are now in a most trying period and are suffering severe financial losses.

"At this particular time prices of practically all farm products are not only far below the actual cost of production, but are relatively far below the prices of other basic commodities. Prices of many of the larger farm crops are well below the pre-war normal, while almost none of them are above it. At the same time the basic commodities which enter into practically everything the farmers buy are from fifty to one hundred per cent, and more, above pre-war normals.

"But the more critical the situation the greater the need for keeping a level head. This is no time to be ruled by prejudices. This is no time for shallow thinking. We are in competition with the farmers of the world. We have a supply of farm products far in excess of the present demand.

"It is a situation which should challenge the very best thought of the entire nation. If it continues the trouble will be communicated to every one. We are brothers of one another. Anything which hurts the farmer will soon be communicated to all of our citizens. The farmers represent probably thirty-five to forty per cent of the population. Anything which seriously affects their buying power will bring trouble to the people who make or deal in the things the farmer buys.

"It is a terrible indictment of our modern civilization when this great country is in the period of what almost might be called economic chaos because of our great surplus food supply, while across the seas, in both directions, almost half the world is suffering for want of food.

Fair Prices Sought

"OF COURSE, the nation is not going bankrupt. The farmers are not going bankrupt. Neither are they going to lie down on their job. Gradually farm prices will be brought into fair relation with other prices and we shall go ahead hitting on all cylinders.

"We cannot hope to reach normal conditions, however, until we arrive on a price level which will be fair to all our people and all products.

"Farm products must come up in price and other products come down, until the normal relation between them has been restored.

"This talk of bringing prices, whether farm prices or other prices, back to the pre-war normal is morally wrong and economically impossible. We incurred a heavy national debt on the inflated prices. If we could force all prices back to the pre-war normal—which we cannot—it would be equivalent to just about doubling that debt. We can pay off our debts much easier if we maintain a price level more nearly the level at which the debts were incurred. Of course, the excessively high prices which prevailed during the war cannot continue, but if we should try to bring about a level, say seventy per cent above pre-war normal, everybody would be better off.

"Now, as to the present situation, surely the duty of the Department of Agriculture is evident. We should do everything possible to find an outlet for our great food surplus. We should search for ways to produce more cheaply. Our scientific men should try to find new uses for our surplus crops. We should help develop more efficient marketing methods.

"It is a time for every man who can help to take hold. As in the days when we dragged our fire engines by hand to the scene of the fire and every good citizen rushed out and took hold of the long rope and did his bit, so we must do now. Every good citizen, no matter in what business he may be engaged, should do what he can to help the farmers through this period of depression, not for the sake of helping the farmer alone, but for the sake of helping himself."

Like the products of industry, the products of agriculture are looking for markets. These markets must be found abroad. Abroad, of course, does not necessarily mean Europe, although Europe is the continent that comes to mind when one speaks of abroad. This means that there are other continents to be developed. It means getting away from the beaten path. It means, more frequently than is imagined, co-operation instead of competition.

Competition by Americans with Europeans, for instance, means distancing the day when fiscal obligations shall be satisfactorily adjusted. Co-operation can mean proper distribution. Proper distribution means consumption, and consumption means business.

The Department of Agriculture, however, faces problems of somewhat different nature from those faced by the Department of Commerce. The former deals in foodstuffs and a few other staples, more or less standardized, whose prices are quite universally known at a given moment, whereas the latter deals with the marketability of manufactured products of variable value, necessity and usefulness.

It is true, as one may gather from Secretary Wallace's views, that there is a surplus of agricultural production just at present, but it is nevertheless true, too, that there are tens of millions of persons who are perilously near starvation, and a few millions actually starving.

Men Who Lost Out

SALVATION for the American farmer, and in proportion salvation for those who deal in the things which the farmer uses or sells, depends upon finding a new way of distributing our goods, perhaps by indirection, and keep them moving so that by a process akin to barter they will eventually reach the ultimate consumer.

"The man who has been farming his own land and who has saved his money has prospered," Secretary Wallace explained further. "The five years prior to 1920 were profitable years, especially to the grain farmer who was so fortunate as to have good crops. If he exercised ordinary intelligence he made more money than he ever before made at farming. Those years were not so profitable to the livestock farmer. The man who grew his own livestock and own grain and fed his grain to the livestock, on the whole, made money, although not so much as he would if he had sold the grain instead of feeding it. The man who bought the livestock and bought the grain and fed the grain to the livestock, on the average, lost money. When hogs were selling at twenty dollars per hundredweight everybody seemed to think the hog feeder was growing rich, but most of the time when hogs were selling at those high figures the men who had to buy the grain to feed the hogs lost money.

"But let me make it clearer to you. The farmers of the United States during the past seventy years have, on the average, produced and sold grains and livestock at less than the cost of production if we take into consideration all the factors which properly enter into production costs. What I mean is that if the farmer would practice a sound system of business economy, charging a fair interest on the capital invested, both in his farm and his farm equipment, a fair wage for the actual labor expended on the farm against his receipts from the marketing of his crops, it would be found that he had not received for them enough to cover his actual costs. The farmers have been willing to sell their crops at less than actual cost of production because they have been willing to accept the value of the farm as a home—as a place to raise their children—as a part of the substantial reward for their work, and also because, as our population has increased, there has been a steady increase in the value of the farm land.

Farmers Should Watch Markets

"BY LIVING very economically, denying himself and his wife the luxuries and many of the comforts of life, they have been able to hang on, paying out on the farm and finally to see it growing into a valuable piece of property. On the other hand, the speculative value has been taken out of the land. The farmer can no longer depend upon the increase in the value of his farm to make good losses suffered through his farming operations year by year. Farmers' crops must sell higher relatively in the future than in the past.

"There are some good people who seem to think that the farmer should not concern himself with matters of marketing. They look upon him as a man whose sole business it is to produce. They think he should grow the largest possible crops and the greatest possible numbers of livestock without asking either as to the demand for what he grows or the price he is going to get. And they seem to think, further, that having produced abundantly he should turn his crops and his livestock over to the nearest buyer and be thankful for whatever he may receive.

"This," Secretary Wallace said, "is a shortsighted view. The obligation to get our food products to the consumer with the least possible waste and at the least possible cost consistent with fairness to all who handle them is just as sacred as the obligation to produce these crops in the first place. No one questions the right and propriety of the manufacturer's selling the products of his factory to the best possible advantage once he has produced them, and the right of the farmer to do this same thing cannot be questioned."

City Mothers to the Rescue

By UTHAI VINCENT WILCOX

OVER in Los Angeles, California, there is a new municipal department in operation; it is called the "City Mothers' Bureau."

This southern metropolis is probably the only city in the United States, if not in the world, where there is a legal department of the city government that is working constantly to prevent and protect—prevent delinquency and protect dependents.

City fathers—councilors, burgomasters, aldermen, judges, police and truant officers—have all been trying to make boys and girls and young men and young women behave by telling them what will happen to them if they don't, but the City Mothers are helping children and grown-ups to be good by making it easier to be good than to be bad.

Like the ideal mother in the home who first tries to persuade, advise and convince her children that the lawful way is the best way, there is still the force of authority in the background to be used only as a last resort, so the City Mothers have police authority but very rarely have they been forced to use it.

Mothers are also confidential institutions. They are repositories of countless secrets, many trivial, some serious, others pregnant with disaster. Likewise the City Mothers' Bureau of Los Angeles is a confidential refuge, there is no tinge of publicity attached to it—there are no reporters about, nor do the walls or clerks tell any tales.

It assists mothers who have lost control over their unruly and straying daughters and helps women in need of advice or police protection. It takes young people from the juvenile court, bad cases in the making, and paves the way for them to lead decent lives without placing the stigma of the juvenile court upon them.

Its strength and stability lie in its maternal persuasiveness backed by police authority. It is the municipality's closest approach to a practical system of helping the members within its boundaries.

Mrs. Aletha Gilbert, the present City Mother, is the originator of the plan. Mrs. Gilbert combines the vision of a crusader with the practical abilities of a woman of experience.

She was born and reared in the city of Los Angeles. She began doing uplift work at nineteen and worked on emergency call in the police department. It was while she was acting as policewoman that she realized the very real need of more preventive work being done. She believed in the old adage, "an ounce of prevention is worth a pound of cure," and could see no reason why the city should wait until Johnny and Mary had become delinquent and had committed a crime before utilizing the powerful forces of the government.

Mrs. Aletha Gilbert saw the bad effect upon young women of the publicity connected with the juvenile court. She knew from twenty years of "close-up" experience that the great majority of girls needed maternal advice rather than harsh police censor and surveillance.

With an advisory board of ten experienced women of the city, most of whom have had a great deal of experience in social service work, she began the introduction and framing of certain ordinances that would regulate the many menaces to juveniles. This board also helped in the creating of a fund through which girls and boys without parents might be given emergency help until work or a proper home could be found for them.

Progressing along this line, the City Mothers have achieved most gratifying results. Only once in the hundreds of cases that they have handled (all satisfactorily as far as can be known) has it been found necessary to resort to police powers. They have proved better mothers to the great family than many home mothers.

The scope of their activities has gone far beyond the original limits—even of the originator. Domestic troubles of almost every nature are soothed and solved Wives who are neglected by their husbands for various causes come for counsel and help. And husbands, too, who need counsel in dealing with recalcitrant wives, come for suggestions, instruction and admonition. The City Mothers have come to be a court of domestic relations, as well as a force for keeping the boys and girls from harm and danger.

Recently a couple came from the East to visit California. They had a child a few years old with them. The husband had been addicted to drinking. In the past he would sometimes leave his home for several weeks and no one would know of his whereabouts. Before coming West he had taken a "cure" and had been getting along better.

When he reached Los Angeles he fell in with bad companions and suddenly left, leaving his wife and child at the hotel with a very limited amount of money. When the husband did not return the wife was frantic. She was in a strange city, among strange people, and alone. What should she do?

She was advised to tell the City Mothers about her troubles, and she did. From this bureau detectives were sent out on the case and eventually located the husband. In the meantime a position was secured for the wife and mother so that she could support herself. The case ended satisfactorily with a united family and what is most important with precautions taken that would make a recurrence difficult, if not impossible.

At another time a young man found a grievance against his wife. He was a hard-working husband who desired a carefully managed home. He was finding it hard to get ahead because his wife was extravagant and cared more for the bright lights than for the cares of the household.

He asked the City Mothers about it. Knowing that his confidence was inviolate he freely talked over with them his troubles and difficulties. He did not wish any publicity. He loved his wife and wished that the City Mothers might talk over the matter with her and persuade her to do differently. His own pleadings had been unavailing. This case was all in the routine of the day and was handled with the same care, tact and skill as the hundreds of others. Now the couple are living together happily and he is getting ahead nicely.

So while the original object of the bureau was to prevent delinquency and protect dependents, the need for a general clearing house of all kinds of trouble was early manifest, and the City Mothers have been equal to the task.

MRS. ALETHA GILBERT

The bulk of the work of the City Mothers, however, is in helping the future citizens of America, the boys and girls, the young men and young women to go straight and to keep within the law.

In thus preventing trouble and forestalling crime they have saved the city and county many thousands of dollars annually, besides sustaining that which is of far greater value—the moral standards of the boys and girls.

To the taxpayer a most interesting phase of this work is that the bureau is conducted wholly without expense as far as appropriations from the city are concerned. The advisory board co-operates in raising the funds necessary to maintain it.

A part of this fund is used to pay the salaries of trained nurses who, during the summer months, care for the children in the municipal day nursery, which is also under the direction of the City Mothers. Here mothers who are compelled to leave their children while they work can do so with the understanding that the little ones will receive the best of care under physical conditions that will promote health and happiness. An average of fifty children are cared for daily in this nursery.

Owing to the growth of the bureau and the work of the City Mothers in untangling domestic difficulties and straightening out the lives of the boys and girls, and because these things oftentimes involve business interests and fine distinctions, a legal adviser has recently been appointed by the mayor.

No less of interest and future benefit are the careful records and statistics that the bureau has been keeping since its inauguration. From a careful study of the register it is most interesting to note that from nine to sixteen years are the "dangerous ages" for children. At fourteen the boys and girls are most in need of help. The number gradually decreases from that period.

For the last year the records are most interesting. There were 1,054 individuals given attention by the bureau. The extent of the work of the City Mothers is shown by the divisions under which these cases were handled:

Contributing, 2; deficient, 2; delinquent, 13; dependent, 331; destitute, 21; desertion, 7; disobedient, 6; domestic relations, 137; felony, 5; illegitimate children, 2; immoral, 5; incorrigible, 9; in danger, 336; insane, 1; kidnapped, 1; miscellaneous, 148; neglected children, 7; petty larceny, 2; runaway, 19. Besides this there were eighty-three applications made to the bureau for help, and forty-nine of these requests were filled.

Mrs. Aletha Gilbert, who is still the guiding spirit and the faithful genius who controls the work of this organization, sums up her ideals and her aspirations when she says:

"Many children of the adolescent age who might be considered by the general public as immoral are handled by the City Mothers as unmoral. If they receive the right guidance until they reach the age of discretion they awaken to a higher sense of morality. We have found that in most cases the fear of the court is more effective than the court itself. We try through love, sympathy, encouragement and personal interest to teach children their duty to their parents and society, and by this same method awaken parents to their duties and responsibilities."

It is natural to conclude that with more City Mothers like Mrs. Aletha Gilbert there would be fewer delinquent children, fewer criminals, and less work for city fathers to do.

"Cutting Up Old Circus Money"

Concluded from page 11

impression that comes before the eyes of anyone who knows him is his mannerism of crooking his elbow, and holding his cigar in his hand before him at about mid-way the distance between his lower and upper vest pockets. These cigars are always mounted in a holder, with a rubber band twisted about the mouthpiece, because the "Governor's" teeth will not grip a cigar holder nowadays. I have never seen him without his cigar, except at meals.

"Now, I've always been a heavy smoker," he continued after he found a cigar to his liking, and had it well alight, "and when General Grant died, I thought I'd better begin to take care of myself, or I might go the same way. So I commenced using holders, and I've used all sorts of them, from some that cost me a dime, to others that cost me $350.

"One season, when I came home from the show, I wasn't feeling very well, and I used to take a buggy ride every day. In going through the village of Terrace Park, near my winter quarters, I saw one of the old settlers working on a wall. I stopped to talk to him, and found out that he was preparing to build a church. I suggested to my wife—she and my daughter were religiously inclined, and so am I—that as I had been through all kinds of experiences I might as well go into the church business, and help build that church. She thought it would be very nice, so I went over to the old gentleman, and told him that I was taking an interest in his church, and would like to help him; that I had about 3,000 or 4,000 feet of redwood lumber, joist and dimension stuff, that I had brought home from my last campaign into California to put into my own residence. Also, I told him that this was rare wood, and that he could have it if it would be of any use to him. I gave him the use of an old horse and dray that we had at winter quarters, and I also gave him $25 in cash to pay a laborer to drive the cart. That settled matters for a while.

"This old fellow was very hard of hearing. He used an ear trumpet. One night he came over to my home at winter quarters, all smiles. He was overjoyed, he said, to see me looking so well, and then he struck me for $600 for the church. Well, I couldn't see $600 then for the church, and as politely as I knew how to do it I refused. The more I refused the more determined he was to get the money, so it got to be right annoying, and a little painful. After a while I commenced to use some cuss words, and he got insulted. He went away after giving me to understand that the church would have a roof whether I put it on or not.

Throughout his life, "Governor" Robinson has been a retiring man. He spent his life building up the circus, and in doing things that he thought would please his family. One Christmas his daughter and some of her school chums came home to spend the holidays. The family carriage met them at the railroad station in Cincinnati, on orders from the "Governor," although the winter quarters is a flag stop for trains at the wagon road crossing that is at the foot of the bluff on which the family home is built. About a mile from the family home, on the road from Cincinnati, the pike hugs the foot of an enormous hill. As it nears the Robinson home the pike plunges into a small forest; approaches the entrance to the home through a deep cut, and leads in a winding fashion to the front portico.

As the carriage neared the winter quarters, about a mile from the home, a brass band of fifty men stepped before it in the road. Of course, the carriage was stopped and the band played a joyful bit of music. At the first note, men, stationed 20 feet apart along both sides of the road, the lines extending to the portico, lighted great flares, and held them aloft. Each man was arrayed in a spangled costume of the circus. Then the band lined up in parade formation, and played march after march as it led the "Governor's" daughter and her friends, riding in state, through the lane of flaming torches to the door of the "Governor's" home. The house was a blaze of glory—such a blaze as only the "Governor's" circus sense could devise.

But the most striking thing about the winter quarters is the children's playhouse, that overlooks one of the valleys of the Little Miami River country. The house is a two-story affair, with a front porch. Inside it is finished with as much care as a large dwelling. The "Governor" erected it for his children, and the structure really is noted among all circusmen as being a most unusual manifestation of a father's love.

I'm sorry that I cannot go further with my answer to the dear old lady who lives in Birmingham, and to the dear old lady who lives in St. Louis, but editorial patience, and the limitations of space, compel a halt right here and now. And at any time that is the penalty that an interviewer of "Governor" Robinson pays for the privilege.

UNIV OF ILL LIBRARY
URBANA ILL

Briefly Told

A New York bank has put into operation a fully tested bullet and bomb-proof motor car which carries the bank's money and securities to and from the depositories in Manhattan and Brooklyn. Provision for armed men is made in the body of the car and small peepholes enable them to defend the securities in the event of attack.

Nearly every workman in Japan wears an inscription on his cap stating the name of his employer and his business. It is a practice that has been followed voluntarily for centuries although it is not required by law.

The Minnesota house of representatives has passed a bill to the effect that persons supplying newspapers with false information for publication will be guilty of a misdemeanor.

Four hundred and fifteen Negroes have been lynched in Georgia since 1885.

The Burroughs memorial forest at Big Indian in the Catskill Mountains was recently dedicated with appropriate ceremonies. At the entrance to the forest a tablet was unveiled.

An order issued by the superintendent of schools of New Bedford, Massachusetts, forbids the use of cosmetics by teachers. Short skirts were also included in the ban but the length was left to the teachers' discretion.

Declaring that the present primary school systems were unattractive, Thomas A. Edison expressed the opinion that the substitution of motion pictures for books in the nation's elementary schools would bring about an advancement of ten centuries in civilization in twenty years.

If the name of any man is erroneously published in the list of draft-evaders now being made public, the War Department will make public apology, the Secretary of War has announced. Every effort has been made to check the list but it is possible that errors might have crept in.

Boy Scouts recently governed the city of Chicago for one hour, every city official being replaced by a scout. The arrangement was made as part of a membership and financial campaign for the scouts.

An average spruce tree yields about five hundred pounds of paper when it is reduced to that product.

Under arrangements perfected by the Shipping Board, American mariners are to receive storm warnings by wireless from all parts of the world. Many vessels on the seas are without radio equipment and in these cases the warnings are to be passed on from ships receiving them by other means when such vessels are encountered.

A cowboy on a South Dakota ranch recently captured a live eagle with a lariat. He saw the bird swoop down on a calf and waited until the eagle had eaten his fill. Then he rode toward it, roped it and carried it home a captive.

Misleading newspaper stories of street "caveins" alleged to be caused by coal mining under Wilkes-Barre have led the Wilkes-Barre Chamber of Commerce to issue a statement denying that surface subsidence has occurred on the city streets. The stories were ridiculous, the report declares, since mining is prohibited under central locations of the city.

A steamship recently dashed into Falmouth, England, afire, after a race of 100 miles to save the lives of her 88 passengers and her crew. The fire was discovered while the passengers were asleep and the captain, keeping them in ignorance of their danger, prepared the boats for launching and made for Falmouth under full steam.

Miners searching for gold along a river in British New Guinea encountered a bluish-gray, flakish substance which they discarded. This substance was osmirdium, a member of the platinum metals and one of the hardest metals known to science. It is worth about $150 an ounce.

Opium secreted in lemons selling at high prices was revealed when detectives investigated a run on the lemon market in the Chinese section of Pittsburgh, recently.

In an attempt to solve the local economic problem, the Tyrol has introduced "Traveler's Money." An act has been passed by the Diet providing that nonresidents of the province in effect, shall pay ten times as much as the native for everything he buys. Half the profit of all transactions will go to the government. The special money is on the basis of the German mark, the exchange rate being at the rate of ten to one.

As a result of the low prices paid for potatoes in Michigan, thousands of bushels will be used for fertilizer in that district this year.

A wrestler on the Pacific Coast recently killed with his bare hands a man he found rifling a bureau drawer in his San Francisco home.

In the island of Guam 747 boys and girls with only eighteen months' instruction produced food valued at $12,000. The work was done in cooperation with the department of education and under the supervision of the Guam agricultural experiment station. Of the total enrollment, 89.2 per cent completed the various courses.

In 1900 there were 184 farms on Manhattan Island where now there are but five. The land there devoted to this purpose is rapidly diminishing.

There are still living on the Island of St. Helena two turtles and a parrot that saw Napoleon when he was alive. The turtles are 170 years old and the parrot 120 years old.

White owls are being raised in the White House grounds under care of the gardener for the purpose of protecting the premises from rats and other pests. An owl will capture and destroy a large rat with ease.

The mayor of Noeux Les Mines, France, has ordered the absolute suppression of music in bars and public places, asserting that "music is the worst breeder of immorality." This order includes the banishment of mechanical pianos, and talking machines.

Japan has decided to adopt the metric system of measures. The House of Peers recently passed a bill stipulating that in the five years to come all leading factories, government works, government offices and technical schools will be asked to use the metric system of weights and measures instead of the Japanese.

A Negro scientist of Tuskegee, Alabama, has discovered 107 uses for the sweet potato. They range from mock oysters to cereal coffee. He is still experimenting.

The only known flock of snow geese in existence recently arrived in Quebec on its annual northern migration. Each year the birds stop at Cap Tourmente on the St. Lawrence River, on their way to the coast of Labrador. They have made these stops for more than forty years and the flock has been closely protected.

The hardened seed of a certain palm is used in Italy for the manufacture of artificial bone buttons. The seeds are shipped from Africa to Italy where the buttons are manufactured.

Experimenters are working on wireless telephones to be placed on automobiles of physicians, business men or anyone who owns an enclosed car. The instrument works successfully up to five miles. It is not necessary to have antennae high in air. Four parallel wires on six-inch posts are sufficient.

Chicago swindlers have been selling stock in the League of Nations at $10 a share. Department of Justice agents are searching for the men responsible for selling the stock. The salesmen collected twenty-five per cent of the price in advance of delivery.

France's heaviest man, weighing 558 pounds, recently died. The heaviest man of whom we have any authentic record died in London during the last century. He weighed 739 pounds.

Wilmington, Ohio, has a girl fire truck driver who answers all calls promptly with the other firemen.

Claquers, men whose duty it is to create applause in the Buenos Aires theaters, have demanded the right to be unionized together with the rest of the theatrical profession. Their activity in this respect is causing considerable confusion and discussion among the organizers of a union which is to include dressmakers, scene shifters and others who live behind the scenes.

Mail-carrying airplanes will land on the roof of the new government post office to be erected in Chicago. Cargoes will then be conveyed to motor trucks or trains via belts or tunnel cars.

Our National Vacation Land Is Beckoning

By R. P. CRAWFORD

A HUNDRED and fifty million acres of forests bid you welcome to the greatest vacation land on earth. Uncle Sam owns the national forests and their vacation pleasures are yours for the taking. For the payment of a modest fee you can even lease a site and on it build your own home in the National Forests and return every year. The opening of great arteries of roads through the forests have brought to common appreciation the scenic beauties which in years past were the sole property of the trapper, the prospector and the adventurer. Camping in the mountains in the early days was often a fool's paradise, which meant hard labor and considerable danger. Now, more than five million people every year betake themselves to the national forests for their summer vacations.

It was not so long ago that the officers of the Forest Service realized that the forests had an asset which was not generally considered in taking account of their many commercial possibilities. That they had great timber resources went without saying; that they protected the watersheds of navigable streams was also to be conceded; and that they were capable of furnishing livestock with abundant range was self-evident. But no one had taken into consideration the fact that several million people in this country take a vacation each year, and that they must have somewhere to go. So it was but natural that the national forests should be considered recreation grounds which would pay big dividends in the steady nerves and good health of the country's citizens.

Most of the national forests are located in the West, but it is true that there are national forests in the East, and even in the Great Plains and Lake States. In some places tracts of land have been set aside for the development of artificial forests, as in the Nebraska sand hills. In fact, today, there are something like 150 different forests in this country. California, Colorado, Idaho, Montana and Oregon have each a score of national forests, or nearly that number. Then there are national forests authorized by the Weeks law, where the government has purchased lands to safeguard the watersheds of important navigable streams. Most of the national forests in the White Mountains and Appalachians of the eastern states are of this sort. There are even national forests up in Northern Minnesota and Michigan.

Take the state of Colorado as just one example. Colorado's national forests have an area of more than 13,000,000 acres. The state itself has forty-one of the fifty-four named peaks in the United States which reach an elevation of more than 14,000 feet. There are 150 peaks over 13,000 feet high, 220 over 12,000 feet, and 350 over 11,000 feet, and almost without exception these mountain fastnesses are located in the national forests, which are public property. Does it not seem a fortunate idea that all of these mountain stretches are owned by Uncle Sam, especially when one sees the rapid encroachment of commercial interests upon scenic properties to which an admission fee can be charged?

Arapaho, Leadville, Battlement, San Isabel, Montezuma—are not the names of these forests sufficient to bring to one's mind the romance of the early Indian days, the Spanish explorers and the early days of Colorado mining history? All that is romantic is embraced in the mountain passes and heights of Colorado. From a prairie country at Denver, with an elevation of 5,000 feet, one gradually ascends to the yellow pine belt with the open forests of yellow pine and Douglas fir, with the birches, maples, alders, and cottonwoods along the stream banks, and with the kinnikinnick and its scarlet berries at an elevation of 6,500 feet. At an altitude of 8,000 feet one has reached the Douglas fir belt, with the thick Douglas fir forests on the northern slopes, and the yellow pine on the southern slopes. At an altitude of 9,500 feet one has reached the Engelmann spruce belt where there are the dense forests of spruce and balsam. Two thousand feet more and one is past timber line and in the Alpine meadows. Here there are grassy meadows aflame with flowers of brilliant color and unusual form, and small willow bushes.

In the northern part of the state are the Routt, Arapaho, and Colorado national forests, with their warm days and cool nights. In the Arapaho Forest are a number of noted peaks, including Arapaho Peak with an elevation of 13,506 feet and James Peak with an elevation of 13,260 feet. There is hardly a stream or lake anywhere in the Colorado Forest that does not afford a good site for camping and plenty of opportunity for fishing. Then come the White River, Pike, Leadville, Gunnison, Battlement, and Holy Cross national forests, forming the west central part of Colorado. The Holy Cross National Forest took its name from the Mount of the Holy Cross, on which is a gigantic cross of snow, visible as far away as the crest of the mountain. This has now been made accessible to mountain climbers and it is possible to ride on horseback to within a mile of the summit. The Pike Forest is easily accessible, being located just west of Denver. It has the distinction of having six peaks over 14,000 feet high, twelve peaks over 12,000 feet high, and more than twenty peaks over 10,000 feet. Pikes Peak is included in this forest. The Black Canyon of the Gunnison, located in the Gunnison National Forest is one of the most picturesque gorges in Colorado. On either side of the river are strikingly colored canyon walls.

In the southwestern part of Colorado are the Uncompahgre, Cochetopa, Montezuma, Durango-San Juan, and Rio Grande forests. These forests are among the most interesting in Colorado. In the Uncompahgre Forest is the beautiful little town of Ouray, known as "The Gem of the Rockies." It is nearly hemmed in by great massive mountains, which tower upward from the very edge of the little village. Easily accessible to the visitors of the Montezuma National Forest are the near-by habitations of the ancient "Cliff Dwellers," which now constitute a national park. Wild game, while quite readily seen by those climbing to higher altitudes of the other national forests, is especially plentiful in the Durango Forest, and it is not an uncommon thing in the summer to run upon elk, deer and bear along the various streams. Throughout all of these southern Colorado Forests are unusual peak and mountain views. It might be said that they are not visited so generally as those in the central and northern parts of the state. The San Isabel National Forest in Southern Colorado is the home of the Sangre de Cristo range of mountains, whose grandeur perhaps is unequaled by any other range in Colorado.

Snowmass Peak and Lake. Fishermen on raft in foreground, Sopris National Forest, Colorado.

However, it must not be thought that Colorado is the only place in which one may spend a summer vacation in the national forests. Prospective vacationists living in the eastern part of the United States will be more interested in the Shenandoah and Natural Bridge forests in Virginia, in the White Mountain Forest of New Hampshire, and the Pisgah National Forest in North Carolina. Then there is the Minnesota National Forest, a great place where one may row, fish or swim. This is near Cass Lake, and fishing is good enough to suit the most fastidious of anglers. In the Superior National Forest, along the north shore of Lake Superior, is one of the greatest canoe countries in the world. It is also the home of the heron and the bull moose. While the Superior Forest contains about a million acres of land, there are 150,000 acres of water including lakes and rivers. These are only a few suggestions for vacation trips. One can go to the national forests in Arizona, California, Montana, Idaho, Washington, Wyoming, or practically any of the western states and enjoy a vacation to his heart's content.

It is even possible now for one to build one's summer home in the national forests, and return to it from year to year. Charges for leases run from $5 to $25 a year, depending on the location, size of the tract, and length of term of the permit. Permits to build summer homes are usually issued for indefinite periods of time, but may be granted for a fixed term of years and not exceeding more than five acres to one person or association. Generally speaking, permits for building summer homes are limited to an acre or less, although this takes into consideration undue crowding in building homes. Practically all portions of the western national forests are open to occupancy under these provisions. In many cases, as in the Colorado National Forest in Colorado, several locations have been especially picked out for this purpose by the forest officials. Portable tent houses may be put up, or regular permanent houses may be built. In some cases where timber is available, fortunate homebuilders have been enabled to secure logs from the national forests free of charge for building their summer homes. In the eastern forests the tendency is to develop public camping grounds rather than lease sites for homes.

Many clubs, associations, business organizations, and even towns have planned summer camps in the mountains not far away. The city of Los Angeles has a camp in the mountains run as a municipal venture. On the Seeley Creek Flats in the Angeles National Forest, the Forest Service has leased to the city a tract of twenty-three acres of mountain land near a fine stream. Several scores of bungalows have been erected here, accommodating from two to six persons. There is a central clubhouse, and also a central kitchen. Water supply, sanitary equipment, tennis courts, and a cement swimming pool have been provided. This camp is simply run as part of the Los Angeles playground system. Each camper must help with the necessary camp work, averaging about an hour a day. The bungalows, beds and food are supplied by the city, as well as transportation to the camp. One gets his vacation at cost this way. Many cities are leasing forest tracts for similar use. One of the California normal schools holds summer sessions about seventy-five miles back in the mountains at a permanent camp. Clubs and associations have planned camps located on national forest land. All such organizations can lease land from the government for this purpose at very reasonable rates. A person desiring to secure a summer home site in some particular forest, should write to the supervisor of that forest, or to the district forester, who has charge of the forests in that state.

The district forester at Missoula, Montana, has charge of the national forests in Montana, Northeastern Washington, Northern Idaho, and Northwestern South Dakota.

The district forester at Denver, Colorado, has charge of the national forests in Colorado, Wyoming, except the western portion, South Dakota, except the northwest corner, Nebraska, Minnesota and Michigan.

The district forester at Albuquerque, New Mexico has charge of the national forests in New Mexico, and all of Arizona except the northwest corner.

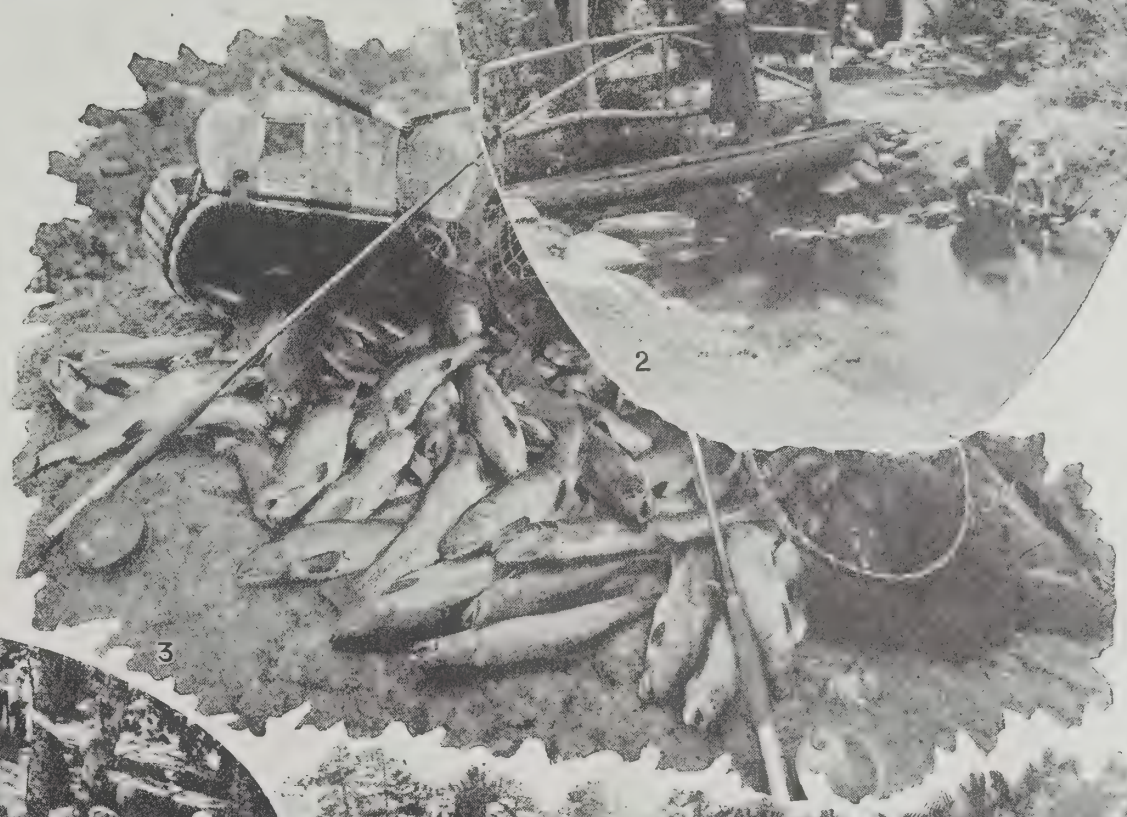
The district forester at Ogden, Utah, has charge of the forests in Utah, Western Wyoming, Southern Idaho, Eastern and Central Nevada, and Northwestern Arizona.

The district forester at San Francisco has charge of the forests in California and Southwestern Nevada.

The district forester at Portland, Oregon, has charge of the forests in Washington, Oregon and Alaska.

The district forester at Washington, D. C., has charge of national forests in Arkansas, Alabama, Florida, Oklahoma, South Carolina, Georgia, North Carolina, Tennessee, Virginia, West Virginia, New Hampshire, Maine and Porto Rico.

Inquiries regarding summer home sites addressed to the United States Forest Service at Washington, D. C. will also receive attention.



Thousands of people, however, will not build their homes in the national forests, but will find their greatest enjoyment in making automobile trips through them. In many national forests, both East and West, camp sites have been established and improved for the comfort and convenience of motorists. Here the tourist will find cooking fireplaces, an abundance of near-by fuel wood, pure water, open log shelters and sanitary arrangements—all of which are free. The most noted forest camp ground is that of Eagle Creek, on the Columbia River Highway, Oregon National Forest, which, it is estimated, was visited by 150,000 people in 1920. Other noted sites are found in the Angeles Forest of California, the San Isabel and Colorado forests of Colorado, and the Pisgah and White Mountain forests in the East.

All that the forest officials ask of these summer guests is that they be careful of fire—and obey the general laws of good conduct. Fire is the most important point for the tourist to watch. A little carelessness in throwing a match into some underbrush, or tossing a lighted cigaret away might precipitate a conflagration that would do hundreds of thousands of dollars' worth of damage. When it comes to fishing or hunting, the laws of the state in which the forest is located must be observed.

It may be truthfully said that the possibilities of summer vacationing in the national forests have hardly been touched. The next few years are going to see more and more roads built, and more and more summer homes established. The best part about it is that these national forests are the property of the entire people, and not as in the olden days for the sole enjoyment of kings and queens.

Somebody Always Pays

WHAT "Get-Rich-Quick" Wallingford might call "legitimate graft" plays a very large part in modern financial deals and dickers. There is a widespread notion that many "pillars of society" systematically steer as close as they dare to the line that separates jailable from unjailable swindling. But the government itself is responsible for the sanction given to the legitimate graft of tax-exempt bonds.

Probably as a survival of the days when "taxes" meant tribute exacted by the rich and powerful from the poor and weak, there is even at this day no very strong public condemnation of tax-dodgers. We compass heaven and earth to punish draft-dodgers years after the war for which they were drafted, even to the extent of pillorying in public print the names of many men who, far from dodging, served their country nobly and contracted wounds and disease in its defense. This we do in the determination that not one guilty man shall escape, even if we have to sacrifice a thousand innocent men. Most of us have a sneaking sympathy for the moonshiner, or for the pseudo-sailor who sells us alleged Havana cigars for which no duty had been paid to Uncle Sam. The average tourist returning from a European trip rather prides himself on "getting by" the customhouse inspector. In fact, an interesting book might be written on the tricks and devices resorted to all along the line by ordinarily honest and respectable citizens in the effort to evade paying their just share of the public tax burden.

Yet all this illegal graft would probably prove but a drop in the bucket compared with the legal graft enjoyed by investors in tax-exempt bonds. This tax exemption must be extremely attractive to people having money to invest, if we may judge from the advertisements of banks and bond houses floating such bonds. They consist in large part of state, county and municipal obligations, usually paying good interest. Bankers regard them as "gilt edged" and are happy to accept them as collateral for loans.

Secretary Mellon in his first report advocates the abolition of this tax exemption as one means of raising necessary revenue in the present financial crisis. It is believed that the total amount invested in such tax-exempt bonds today is not far short of twenty billion dollars. Some estimates place it as high as $40,000,000,000. A tax of only one per cent on the lesser sum would produce an additional revenue of $200,000,000.

This in itself should be sufficient reason for a revision of Federal tax laws that would include prohibition of tax-exempt securities. A further reason of much cogency was suggested to the Senate Finance Committee the other day by Philip H. Gadsden, of Philadelphia, who appeared as chairman of the joint tax committee representing the American Electric Railway Association, American Gas Association and National Electric Light Association. He pointed out that the abolition of the exemption would enable regulated public utility industries to dispose of their securities and raise badly needed money. "The most serious question which confronts public utilities," he said, "is their inability to secure the necessary new capital required by them annually in competition with tax-exempt municipal securities." And he added that the present policy was one under which the country was rapidly drifting into Socialism.

Let us be frank and recognize tax exemption of this sort as merely an immoral legalization of tax dodging. The tax which one man dodges another and probably less wealthy man pays. Someone must pay always.

"Propaganda"

THE word propaganda has an honorable history. It was for the propagation of the faith, for the wider dissemination of the light of truth, that missionaries in the old days braved the dangers, hardships and privations of far ventures in savage lands and among savage peoples. Of late, however, it is not to be denied that the term has come to be suspect. In some quarters it is already synonymous with deception. For this we have largely to thank the impetus given during the war to the preparation and distribution on a scale of unprecedented vastness and elaborateness of ex parte arguments.

Just now newspaper offices all over the country are being flooded with "propaganda" of one sort or another. And it is curious to note a family resemblance in much of this voluminous product of the ready writers in the pay of one interest or another. There is the sales-tax propaganda got out in the names of various commercial organizations, but plainly enough deriving central inspiration from the Jewish banking house of which Mr. Otto H. Kahn is the shining head. Then there is the Polish propaganda and the anti-Polish propaganda, the Sinn Fein and the anti-Sinn Fein pamphleteers, the Japanese and the anti-Japanese —and always the pro-Jewish propaganda.

There would be no objection to the spending of thousands, perhaps millions, of dollars on this printed matter and the jobs it furnishes to the "space men" and the printers, if it did not seek to influence public opinion by sailing under false colors. Readers would be enabled to make all due allowances for bias and interest in the presentation or suppression or distortion of facts characterizing all this matter, if it were plainly labeled as paid advertising and the real names of the men who pay for it were attached.

As the experienced advertiser now well knows, the poorest of all advertising is that which masquerades as "reading matter" and in which false or exaggerated claims are made. By a natural reaction, people who have once been fooled become shy and suspicious of this camouflaged "publicity." So it finds its way promptly to the waste basket. In the long run, the people demand and will have the truth. They will insist on being allowed to make up their own minds on any question.

The Father of the Common School

THE celebration of the 125th anniversary of the birth of Horace Mann in the schools of America should give point to the present educational revival. It is difficult for us today to realize the gigantic task which Mann faced at the beginning of his career when, as secretary of the board of education of Massachusetts, he set about the reform and reorganization of the public school system of that State. A very practical idealist, he battled for a quarter of a century against the inertia and the antiquated prejudices of his time. But he lived to see the definite era of a truly democratized common school system placed on a basis of efficiency and progress not only in his own state, but also throughout the Union.

The twelve volumes containing his reports as secretary of the Massachusetts board, and which contain his ideas and recommendations, are now regarded as educational classics in Europe as in this country. Although a publicist, statesman and administrator, rather than an educator in the professional sense, Mann has been the inspiration of two generations of forward-looking teachers in America, and has exercised a profound influence on the whole American attitude in regard to our common schools. One of the many living monuments to his memory is the Horace Mann School in Chicago, in which a worthy disciple developed and applied Mann's ideas with a success which has made that school itself a center of true educational influence.

It is worthy of remark, too, that Antioch College, at Yellow Springs, Ohio, of which Horace Mann was president during the last seven years of his life (taking up the work after his retirement from Congress), is this year setting the pace in an advance step which is bound to mean much for the future relation of industrial life to national culture. This is the establishment of engineering and machine shops in close co-ordination with the liberal and theoretical courses of the classrooms, and the actual employment of students during their college careers in the work for which they are preparing, a departure which was the subject of a most informing special article in THE DEARBORN INDEPENDENT not long ago.

North Dakota's Struggle

AN ELECTION to recall a number of important state officials belonging to the Non-Partisan League in North Dakota is scheduled to be held "on or before November 8." In an appeal for financial help sent broadcast by the League organization, it is charged that the opponents of the present state administration will seek to gain an advantage by forcing this recall election early in June, when the farmers will be busy at home. Evidently the reformers anticipate a life-and-death struggle with the enemies of the League program. They have been successful in seven straight state-wide elections; but this time the fight is to be waged under conditions that make the outcome anything but certain.

According to the Non-Partisan League spokesmen, the situation has taken on the aspect of a beleaguered city in which the besiegers have settled down grimly to the starving out of the defenders. For the last four years, the rainfall has been utterly inadequate in the western part of North Dakota, the League's stronghold, and the farmers have had poor crops or no crops at all. Added to the drouth damage, many parts of the state have been plagued with grasshoppers, while the wheat yield has been disastrously cut down by attacks of rust.

These losses mounted into the millions and would be serious enough, but the farmer was further impoverished this year by the unprofitable prices of farm products, attributed to raids of the grain gamblers and affiliated big bankers. Although the farmers got only about one-half what they received last year for their wheat and corn, they were forced to sell their live stock at prices far below the cost of production, while supplies they had to purchase had not fallen in anything like the same proportion.

The present fight seems to rage about the state-owned and state-controlled Bank of North Dakota. It is charged that the moneyed interests of the entire United States see in this people's institution a menace to their own monopoly in the business of money-mongering and are determined to put it out of business. To that end, it is alleged, they have organized a boycott of North Dakota bonds and incited adverse legislation designed to cripple the state financially, that it may be held up as a horrible example to farmers of radical tendencies in other states.

It is mainly to prevent the sale of the North Dakota bonds issued to finance the bank and other state-owned and operated industries, such as the state hail insurance and state grain-grading laws (which alone have saved the farmers of the state some $8,000,000 yearly), state mills and elevators, state insurance on public buildings, state-built homes for workers and workmen's compensation and war veterans' bonus funds, that League opponents have initiated the coming recall election.

Whatever differences of opinion we may have in regard to the feasibility of government ownership, it must be conceded that the North Dakota experiment has vital interest as a demonstration of its possibilities for good or evil. The Dakota farmers are entitled to a fair chance to give it a fair test. And that means they should be given every aid to even up the handicap imposed upon them by the heavier monetary artillery used against them by their opponents and by the losses incurred through untoward crop conditions and economic chaos not of their own creating. For the campaign fund to fight the recall of their elected state officers, they ask that "every friend of freedom" send at least a dollar bill to Non-Partisan League Campaign Headquarters, Box 919, Fargo, North Dakota. There are quite a number of us in the United States who regard ourselves as "friends of freedom." If all respond, the League should have a sufficient campaign fund.

Why Colleges Fail

LACK of ability on the part of a college graduate to answer all Mr. Edison's 160 questions may not be a conclusive evidence of ignorance, and so a reflection on the efficiency of college teaching. But the incidental revelation of an inability to answer a dozen simple questions dealing with everyday practical life, recklessness in attempted answers that showed a slipshod mind, an attitude of supercilious superiority to the remembering of facts easily within the knowledge of a man of average intelligence, or a helpless inability to find the desired information, might well be set down to lack of the ordinary intelligence required to make a satisfactory worker in any field of industry.

It will have to be agreed, accordingly, that Mr. Edison has made out a good case against our present educational system. If it cannot be relied upon to produce intelligent and well-informed men and women it stands condemned. That an occasional man or woman comes through college well informed and intelligent does not alter the outstanding fact. The college fails in its chief function if it does not teach every student within its walls to think and to think straight!

Mr. Ford's Page

THERE is a false theory which dates from ancient times that the way to prevent social or political disruption is to prevent the people from thinking. Keep their minds off fundamental problems and everything will go along without disturbance. Sometimes this was done by free circuses and free distribution of food, as in ancient Rome. Sometimes it was done by bringing on a war when the population seemed to be growing restless. Sometimes it is achieved by bringing upon the stage a leader with a Roosevelt personality who captures the imagination of the people and gives an appearance of rushing hither and thither on an endless series of hopeful quests.

In these days, the same doctrine is preached with reference to unemployment—keep the people employed, because if you do not, they will begin to think, and thinking is not a good sign.

It is doubtless true that unemployment is unnecessary, or would be unnecessary if our affairs were managed by plain common sense. There is always enough to do and always enough people willing to do it, but there is always also that little-understood matter of money which usurps so big a position in the question. Unemployment is everybody's fault, and not the fault of a class only, as the false teaching of the day asserts. The class propaganda is merely a postponement of the sense of general responsibility which all the people must feel before substantial and enduring progress can be made.

As to the dangers of the people thinking, there are several points to observe. Thought, of course, is the most powerful dynamite in the world. Thought has achieved whatever we see. Wrong thought has achieved all the wrong we see. It is not thought that is dangerous, but its temper and direction.

It is perhaps true that one of the root causes of our troubles today is that there is too little public thought. More people are reading than ever before—as witness the enormous editions of incendiary literature which the radical organizations circulate—but what they read stirs up something besides thought. It stirs up passion, resentment, hatred, the latent destructive faculties, and puts the man into fierce vibration, but this is not stirring up thought. Thought has quite another tone and result.

What little thought may be mixed in these manifestations of the destructive passions is thereby contaminated, prostituted and neutralized. Men cannot think under such conditions. The real problem is not how to prevent the people thinking and asking questions, but how to make it possible for them to think under right conditions.

During the period of stress and unemployment which is now happily past, many people did a great deal of so-called thinking. That is, they brooded and they made vows and they gave vent to great denunciations. It was not purposeful thinking. How could it be? When a man is in a corner, how can he be expected to be philosophical? Unless, of course, he is an extraordinary man; and if he were that, the chances are he would not be in a corner.

Our best social thinking is not done in periods of stress and enforced idleness. Indeed, you can measure the difference between real thinking and brooding, by measuring the difference between leisure and idleness. Leisure is necessary to thought, but idleness seems to be the enemy of thought. Leisure is a breathing period in a situation in which the man feels secure; idleness is a brooding period in a situation in which the bottom has apparently dropped out of the man's security. If the lay-off last winter could have been employed as leisure, if men had been so well provided for that they could have looked upon the lay-off as a welcome vacation, the mental results would have been beneficial to the country. As it was, the idleness was not leisure, and the psychological recovery is just as necessary as the economic recovery.

SOME men appear to be afraid to have the people think. The danger of every age is that the people do not think half enough. Thinking is too hard work ever to become a popular pastime. The nearest we come to thinking is when things begin to go badly, and that is the wrong time to begin thinking. The best time to think about economic problems is the time of prosperity. But we allow others to do our thinking for us then—the shallow optimists; and when bad times come, we still allow others to do our thinking for us—the destructive and anti-social radicals. A man out of work cannot think completely round the subject; the man who has a job and is reasonably secure is able to consider the whole subject in a normal light and reach constructive conclusions. Do your thinking when the sun shines.

The farmer is a good illustration of this. No one can deny that the farmer has been very hard hit and that his problem is the problem of every one of us. Until we regard the farmer's problem as our own, we are neglecting a bulwark of our economic security and our social solidarity. We hear in other countries of "Soldiers' and Workmen's Committees"; what we need in this country is a better understanding and a closer relation between workmen and farmers.

During the slack season of the winter, when the farmer himself was shut out of his fields by winter, he did a great deal of brooding. He had enough to brood about, too. And he expressed himself quite fully. His leisure was robbed of its value because of the change that had come in his economic standing, and his thoughts veered likewise. He said, among other things, that he would not raise a bushel more grain this year than he needed for himself and family! He was through being the football of the profiteers! He would show them that they could not do as they liked with him!

It was a serious threat. Aside from the economic phase of it, there was something ominous in the priests of the soil threatening to prevent the forces of nature doing their seasonal work.

But what has occurred? The sun of spring began to shine and the spring rains came down, and the farmer went forth to his fields. He began to work. Work began to heal him. It is safe to guess that what the farmers think by the end of the season, by the time of harvest, will be more constructive than what they thought during the winter.

If the people only would think, and if conditions could be maintained which would enable them to think constructively, few problems would remain unsolved. Prosperity is the best time to think, for then you have the elements which are desirable to be maintained, and which the thoughtlessness of the people are sometimes a very large element in destroying.

Why is it that public thinking, under conditions of prosperity, is more valuable to the public interest than the so-called thinking which is done under economic stress?

The answer is clear. First, the man is free to think without bias or resentment. There is no sense of personal wrong resting upon him, no feeling of bitterness twisting all his views into one channel. Second, the elements which are fundamental are present before him—the fact of work and its necessity; the fact of home and its security; the fact of society and the great dependence it has on ordered industry. Third, a general view into all the grades of life which ease of mind permits him and which stress of mind often shuts out; he can consider his children and their education; morals and their sanction; literature, science, politics—all the things which are shut out and undervalued when mental stress forces the mind into merely class questions.

Now, with none of these things present, but with himself forced down to the animal plane of finding something to eat, plainly the man is not in a position to do all-round thinking. And it is all-round thinking that is going to save the people from lopsided mistakes. Our education cannot be too general, our acquaintance with the grades of life too wide, for in the breadth of our view comes the correction of our tendencies to narrowness.

Therefore, the agitators of destruction know exactly what they are doing when they choose the times of depression for their propaganda. Would that the children of light were as wise to choose the times of prosperity for the cultivation of sound, unbiased and constructive thinking upon the matters pertaining to our common life!

Anyone who preaches that the people must be prevented from thinking is as dangerous to society as are those who spend immeasurable zeal in their efforts to make society think wrongly. It is when all the people think, normally and wholesomely, that the world will become what it might be.

Reconstruction Tasks Republicans Assume

Some of the Problems as Seen by G. O. P. Statesman and Leader

By J. S. FRELINGHUYSEN
United States Senator from New Jersey

THE Republican administration, supported by a majority of twenty-two in the Senate and one hundred and seventy in the House, and upheld by an enormous popular majority, has before it a task unequaled in our generation and perhaps in the history of the government.

So well-nigh unanimous has been the voice of the electorate that it may be said without fear of serious contradiction that the Republican party has received a mandate not only to reconstruct the executive departments and our entire governmental administration upon a more businesslike and efficient basis, but to revise the laws so as to make them harmonize with the foreign and domestic needs of a country which has grown tired of arbitrary impediments to commerce and to the free expression of its intelligence, and, above all, a mandate to maintain our position as the first nation of the world.

It is, however, a time for caution. Our responsibility is grave. Our task is serious. We must put the country on a sound financial basis. Our foreign policy must be thoroughly American. Above all, we must return to constitutional government and cast aside any and all autocratic practices, many of which doubtless were advisable or perhaps necessary during the war.

As a people, we are faced with a tremendous responsibility. We must husband our resources. We must be content with nothing less than to be the greatest nation of all time, not in dominion or merely in wealth, but in service to mankind. This service consists in developing this nation to the utmost so as to reveal to an even greater extent what liberty may do under republican institutions.

We have just concluded in this country two great moral reforms. By one we have suppressed the liquor traffic and by the other we have admitted that the intelligence and character of women are needed at the ballot box no less than those of men. I doubt if the earnest men and women who brought about these reforms will be content with anything short of another triumph. I think they will now turn to the establishment of an efficient and economical government which will know how to deal with the many and pressing problems of the times in an orderly and businesslike way.

The problems are many, but if we practice economy, if we would avoid entangling alliances, and if we are guided by the Constitution, I have no question but that we shall deserve to remain in power and will remain a long time. And I have no doubt of constructive results at the hands of the party of Lincoln, McKinley, Roosevelt and Harding.

Problems the Party Faces

LET us look into some of our problems and their remedies, some glaring anomalies of our government departments from a business point of view, and some of the outrageous violations of business principles in the conduct of some of the governmental activities. With the return of the peoples everywhere to normalcy, it becomes imperative that we rescind unwholesome fiscal practices. The people must realize the necessity of work. And as we promised in the campaign, we must have more business in the conduct of the government and less government in the conduct of business.

In order to maintain that untrammeled initiative which is the genius of our institutions and has made all our progress possible, the Republican party is opposed to public ownership of public utilities and, instead, favors their strict regulation for the benefit of the people. Regulation is a necessity inherent in the business of public utilities. But, taking the railroads as an example, in so far as freedom is consistent with the character of public utility, we must see to it that government, in the exercise of the power it has assumed, must be the big brother, alert not only to guide but to strengthen. Our restrictions and safeguards we shall confirm and uphold; but our spirit will have in it that bold and courageous generosity that was typical of the faster growing America in the first era.

It was the Republican party which gave us our original Interstate Commerce Act, which founded our Interstate Commerce Commission, and which gave us the Sherman anti-trust law. It was the same party which made the development of our wonderful western country possible through the Homestead Act. With something of the same spirit it sought to conserve our national resources and also enacted the national reclamation act for the irrigation of arid lands. With that same progressive spirit, the last Congress enacted two laws for which the country had been clamoring for years and which the Democrats failed during their period of control to pass. One is the coal and oil land leasing bill, which retains control over and yet stimulates the development of our as yet unused mineral lands. This promises to increase the production and lower the price of fuel. The other is the water power bill, which gives Congress complete control over this great source of creative industrial energy. These laws are far-reaching and evolutionary. They stimulate our national growth in such a way that it cannot get beyond the control of the people.

The government departments and bureaus in Washington are swelled out of all proportion to what they should be. When war was declared we had a total of 32,000 employes; at the time of the signing of the armistice we had 117,000. After two years of actual if not technical peace we still have 55,000 more employes in Washington than when the war began. Within the next few months we should further greatly reduce the total, and if it is at all possible return to the pre-war basis.

The Bureau of War Risk Insurance has given out the information that it has received gross applications numbering 4,655,916 and amounting in risk to $40,414,715,500. These are stupendous figures and would greatly impress us with the usefulness of the bureau did we not stop to examine them. The facts are that only 300,000 who have been honorably discharged from the service are still paying voluntarily on $1,740,000,000 and 200,000 now in the service are involuntarily paying on $990,000,000 on the risks in the grand total applied for. Ninety per cent of our soldiers, sailors and marines have not been sufficiently interested in their war-risk policies to keep up their payments and they were, therefore, dropped. If such a large proportion of men have abandoned government insurance, is it not fair to conclude that the bureau is a failure? Certainly the government should not go into the insurance business at a loss. The insurance should be continued for those who care to keep it up, but I can see no reason why the War Risk should not be abolished and all of its functions turned over to the Pension Office. The good of the bureau thus would be retained and much expense done away with. Then, in accord with Republican policy throughout two generations, we should continue to assist those disabled in the service and their dependents. Many millions would be saved from the taxpayers and at the same time a policy would be continued which has always been proved fair and beneficial. At least one-half of the present cost—ten millions—would be saved.

Other bureaus are overstaffed. One of these is the Bureau of Loans and Currency which in four years increased its personnel from 40 to 2,000. The Bureau of Engraving and Printing has thousands of clerks at work on activities growing out of the war which should be rapidly completed. With the completion of the census 2,000 more clerks should, of course, disappear. Several bureaus overlap in their activities. Thus the Bureau of Mines and the Bureau of Standards are making the same investigation of heat treatment in improving the quality of steel. Thus also the Bureau of Education, the Woman's Bureau, the Children's Bureau, the Public Health Service, the Census Office and the Department of Agriculture overlap in many instances.

This is only a part of the evidence of the crying need for the strictest sort of economy in order to bring us back to a businesslike conduct of the government, because outside of executive departments we find forty boards, commissions, offices, and bureaus which have no supervision except from Congress. In other words, a great deal of the executive functioning of the government is illogically and wastefully organized.

One of the evidences of waste and extravagance is provided by what is known as the Reclassification Commission, which has had for its noble purpose the rearrangement, on a more equitable basis, of the salaries of the government clerks. This commission spent $75,000 of the people's money and made a directory classification, which has failed in Chicago and every other municipality where tried. No great business enterprise would think of establishing a wooden standard of classification and remuneration for every position. Yet from the Reclassification Commission we have a voluminous report, which has all the appearance of presenting the details of a Chinese civil service.

Shipping Situation Hit

NO MEMBER of either branch of Congress has more sympathy for the just grievances of the underpaid government clerk than I have. When I see a man in charge of the sale of our public timberlands, and with many millions of dollars intrusted to his hands, receiving $1,800 a year, I know that something is wrong. Whatever rearrangement is made should be upon a plan that will make for increased efficiency and more business activity in the departments. Certainly something should be done to remedy flagrant inequalities and inadequacies in government salaries.

I know of no more outrageous violation of business principles in the conduct of the government than the extraordinary extravagance and waste practiced in the United States Shipping Board. In that remarkably inefficient organization 7,800 employes remain of those who assisted in throwing away two billions of the people's money. Congress has already laid down broad lines along which the efficiency of our merchant marine may be improved. It has provided that all our ships under government operation be turned over eventually to private ownership. It should become one of the chief aims of our Republican administration immediately to turn over to private ownership all government-owned vessels. Unless we have a selling organization in the ports of the world all this immense investment which we have in the merchant marine will go for naught.

We should have in every mart of the world, either through the consuls or the ministers or the legations, agencies to promote the carrying in American ships of the cargoes that are sent out from those ports. Our grand export total should give way to serious consideration of the problem of stimulating our manufactures by securing new foreign markets for them.

Everything must be done to stimulate the farming industry and encourage our farmers to continue production. Much has been done in this direction. They have the parcel post, rural free delivery, farm loan banks, better roads and telephones. Life on the farm is much more livable than formerly. Our American farmers have enjoyed during the period since the World War a greater prosperity than ever before. But they have had a serious setback. By wise governmental policies this temporary setback can be overcome. We must at all hazards maintain healthy prosperity, but not by keeping up fictitious prices created during a time of greatest demand and during a saturnalia of inflation. We should protect farmers and their standard of living by a tariff which will keep out foreign products grown under cheaper conditions, and this should be done at once. And then we should work out a national policy of benefit to the farmers generally, North and South.

The Department of Labor should be reorganized. The powers of the adjustment service should be extended. Between two and three millions of wage-earners are out of employment according to official reports. To help offset this condition we have another problem to solve, which should not be beyond American ingenuity or the constructive genius of the new administration.

There is a middle ground or method by which we may harness the vast energies of American labor and the productive might of American capital to the task of making America supreme among all the nations of the world in productive capacity. When we find that method we shall be fully prepared to lead the greatest commercial revival in history, soon to follow upon the present period of liquidation, for the energies of the earth have been quickened by war and those energies will be turned to commerce, as they always have after the period of readjustment following every war we have had.

Other Tasks He Sets

THE principle of collective bargaining should be acknowledged in interstate commerce, but unions should live up to their agreements when made. The fallacy that labor creates value and that labor is therefore entitled to the full return on the value it creates—which is the basis of most of our socialistic propaganda—should be met with education as to the real part which both labor and capital play in industry and as to the worth of initiative in our institutions.

The Department of Labor should not be conducted as an adjunct of the American Federation of Labor nor as a vehicle for the views of those who favor non-union labor entirely. It should be administered for the benefit of all our wage-earners everywhere, and the Republican party should make it its policy so to utilize it that in the four years to come it will actually better working conditions and at the same time assist in the upbuilding of the prosperity and efficiency of American industry.

The Post Office Department should be overhauled and made more efficient by taking the parcel post business from the main offices in the larger cities and conducting it through warehouses or other space obtained for the purpose. This is really an express business, and is delaying the delivery of the regular letter mail in these offices. For the protection of the banks and other senders of valuable mail, the carrying of mail by aerial route should be stopped unless special stamps are provided and it is so designated by the sender. Congress stipulated that this be done, but the former Postmaster-General so construed the statute as to do the opposite of what was intended.

The Department of Commerce should become an aggressive, reliable and efficient instrumentality for the development of trade. That is what it was intended to be, but instead it has become, so far as our foreign commerce is concerned, an adjunct of our Consular Service. It should issue exhaustive monographs on the foreign sources of markets for our goods. There should be quick general reports on this subject. It should be made the chief factor in the American trade boom of the next ten years.

While our total indebtedness is $24,330,889,731, our Liberty and Victory bond war debt on June 30 last amounted to $19,581,201,450. Less the $9,445,006,855 we loaned to our foreign Allies, and nevertheless owe the American people, because we borrowed it from them, we owe $10,136,194,595. By act of Congress provision was made for payment into a sinking fund of an amount equal to the sum of two and one-half per cent of the total Liberty and Victory loans, less an amount equal to the par of the obligation of foreign governments held by the United States on July 1. By this $235,000,000 will be paid each year and in twenty-five years the debt will be wiped out. This refunding provision should be so extended as to include the entire war debt.

We should, it seems to me, remedy our entire present fiscal arrangements by taking the tax from small incomes, removing the surplus-profits tax and surtaxes, and at the same time by gaining more revenue by a protective tariff and by a tax on manufacturers' sales. For rendering less complicated our entire fiscal affairs the enactment of the budget system is vital.

An Hour With a Great American Sculptor

By O. LAWRENCE HAWTHORNE

LORADO TAFT

"IT'S A curious thing about my statue at the Colony!" exclaimed Lorado Taft. I had spoken of the colossal concrete image surveying in majestic splendor the historic Rock River Valley south of Rockford, Illinois.

"I did not name it Blackhawk," he continued, "and had no idea of representing the old warrior at all. My fancy was simply to erect an Indian figure symbolical of pioneer days. Blackhawk was a hard-faced old boy, you know, so I was really careful *not* to reproduce his features."

As we hastened from the station to the Rockford Elks club, Mr. Taft's attention was repeatedly attracted to buildings he remembered. Incidents of early visits to our city were brought to mind.

At the Church of the Christian Union, his keenly active memory recalled the fact that back in "World's Fair time" he gave a number of lectures there.

"By the way," he said, "one of my girls made a very fine bust of the white-haired old gentleman who was pastor then."

Later in the day, as a guest of the Kiwanis Club, Mr. Taft visited the building and examined with the delight of a boy this reminder of his earlier activities.

"There's the Rock—our river!" was the great artist's greeting as we alighted at the club. His features—extremely fine in texture and molding—were aglow with the nature-love burning in his heart.

"It is my great desire to spend my declining days at the Colony," observed Mr. Taft. "You know I have a studio there, and it is a haven for all of us. I have made so many delightful friends in this wonderful valley. The Artists' Colony has had twenty-three years of happy experience upon Mr. Wallace Heckman's farm only a few miles down the valley. Its painter members have celebrated the autumnal glories of this region in many exhibitions at home and abroad."

Mr. Taft responds readily to all questions regarding his world-famed concrete landmark. I asked him about the inspiration for an Indian memorial. He was immediately aglow with reminiscent pleasure.

"It happened this way," he replied. "Every evening as the shadows turned blue, we walked over the bluff, Eagle's Nest. We always stopped at a certain point to rest—it was our fourteenth summer and we had generally taken that attitude—restful, reverent. And as we stood there, we involuntarily folded our arms, and it came over me that generations before had done so. And so the figure grew out of the attitude, as we stood and looked on those beautiful scenes."

A quotation from the dedicatory address by Edgar A. Bancroft at the unveiling of Blackhawk, July 1, 1911, expresses in a beautiful manner, says the sculptor, the thing he has attempted to perpetuate in stone for generations yet unborn. Mr. Bancroft declared:

"There the sculptor has placed imperishably the Indian—not sullen, not resentful, not despondent, not surrendering; but simple, unflinching, erect; with the pathos of the past in his face, the tragedy of the future in his eyes but with the dauntless courage of a man in his figure and in his whole attitude."

"The face of the statue is purely ideal," mused Mr. Taft. "It is a composite of various portraits of Indians. I left off the usual Indian trappings—the feather and buckskin and other conventional signs. There is even a hint of the old Roman in the face, which was necessary to make it suggest a spirit unconquered while still the conquered race. To be suggestive rather than direct, is what I aimed at; to do that is the great joy of the sculptor.

"We artists love the Rock River Valley and I am sure it must have had a strong appeal to the Red Men. So it was a natural idea for a sculptor to represent one of the old-time inhabitants taking his last look over that beautiful country—the home out of which the white man drove him."

Many residents of the Middle West are on terms of personal acquaintance with Blackhawk. Motoring and the ever-enticing beauties of the Blackhawk Trail weekly take hundreds and hundreds of tourists to Oregon, Illinois. Familiar to us has become the massive figure placidly defying the elements, and offering challenge to the ages of time. But how many know the story of its erection, the manner in which it was built? I asked Mr. Taft for particulars. Here they are:

It is made of solid concrete except for a hollow perpendicular shaft in the center, terminating just above the folded arms. This shaft is large enough for an observer to be elevated and peer out over the valley through a small window which is invisible from the ground. The statue, exclusive of the foundation and low pedestal on which it stands, weighs 270 tons.

The erection of Blackhawk was accomplished only after two summers of hard work, and after encountering many engineering problems. Five hundred barrels of cement were used in mixing the concrete, and a motor and windlass for getting it to the top had to be installed. The concrete was "poured" into a mold, which was prepared in an unusual way. First, a six-foot plaster model was made and this was enlarged by careful measurement to a frame of scantlings around an elevator shaft.

When the entire figure had been framed in lumber, the surface was made by stretching wire netting over the timbers and then nailing burlap over the forms. The burlap was painted over with plaster of Paris to make it stiffer. Next, a three-inch mold of plaster was built around the model. Finally, everything was taken out of the mold and the entire space, with the exception of the central shaft already mentioned, filled with concrete.

Regarding Mr. Taft's most recent triumph—the Fountain of Time in Chicago—he is justly though modestly proud. Many years have been devoted to its conception and final accomplishment. Much of the great artist's soul is expressed in this symphony of grace and grandeur.

He spoke of the fountain in this way:

"A vagrant line or two of Austin Dobson's once made a great impression upon me. Says the poet,

> 'Time goes, you say? Ah, no,
> Alas, time stays; we go.'

The words brought before me a picture which speedily transformed fancy into a colossal work of sculpture. I saw the mighty, crag-like figure of Time, mantled like one of Sargent's Prophets, leaning upon his staff, his chin upon his hands, and watching with cynical, inscrutable gaze the endless march of humanity. A majestic relief of marble, I saw it, swinging in a wide circle around the form of the lone sentinel and made up of the shapes of hurrying men and women and children in endless procession, ever impelled by the winds of destiny in the inexorable lock-step of the ages. Theirs the 'fate-formed movement' which has not ceased since time began. But in that crowded concourse how few detach themselves from the grayness of the dusty caravan; how few there are who even lift their heads. Here an over-taxed body falls—and a place is vacant for a moment; there a strong man turns to the silent, shrouded reviewer and with lifted arms utters the cry of the old-time gladiators: 'Hail, Caesar, we who go to our death salute thee!' and presses on."

Lorado Taft was born at Elmwood, Illinois, in 1860. He is a graduate of the University of Illinois, where his father was professor of geology.

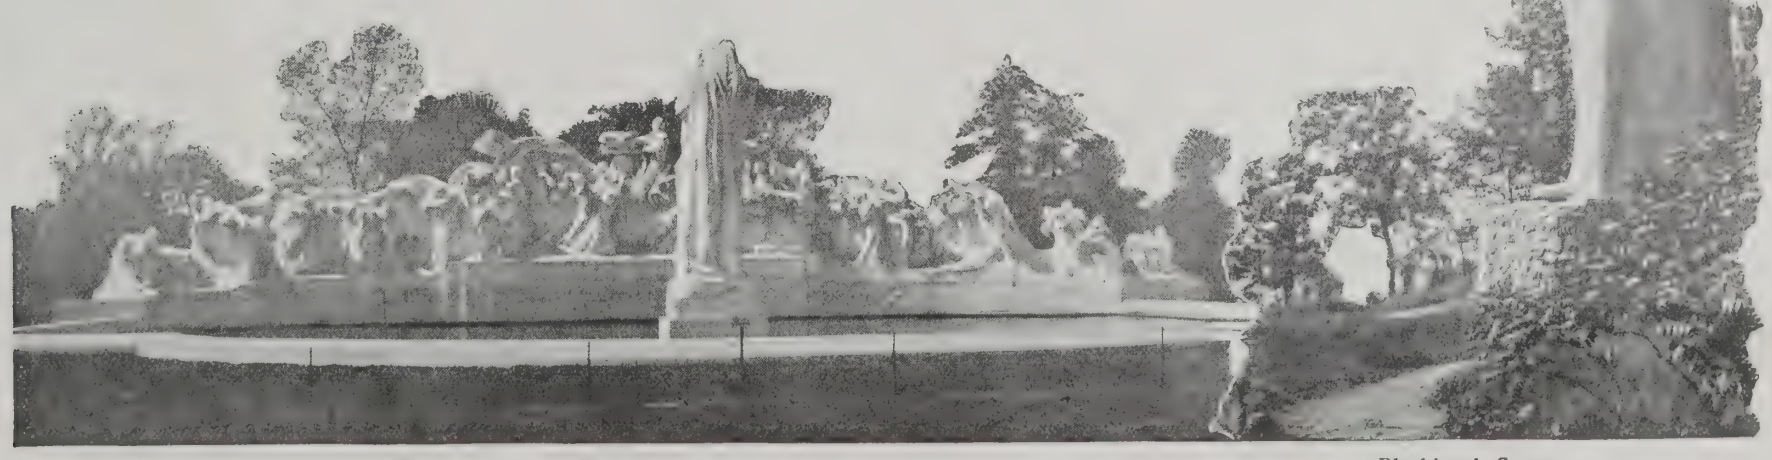
His interest in sculpture began when, a boy of thirteen, he was permitted to help an Italian plaster-worker repair a collection of casts which had reached the university badly damaged in transit. The boy found it a delightful game to pick the pieces out of the packing boxes and fix them together, like assembling a jig-saw puzzle. For the first time it was seen in what direction his tastes lay and he carried on his modeling all through his college course.

In 1880, after his graduation, Mr. Taft went to Paris where he studied for five years in the Ecole des Beaux Arts. Since 1885 he has resided in Chicago, with occasional trips to Europe, including Italy and Greece.

He has been connected with the Art Institute of Chicago for more than thirty years, as instructor in modeling and as lecturer. He is professorial lecturer on the History of Art at the University of Illinois. He is a member of the National Sculpture Society, of the National Academy, of the American Institute of Arts and Letters, an honorary member of the American Institute of Architects, and is one of the board of art advisers of the state of Illinois. He received a silver medal at the Buffalo Exposition in 1901 and a gold medal at the Exposition at St. Louis in 1904.

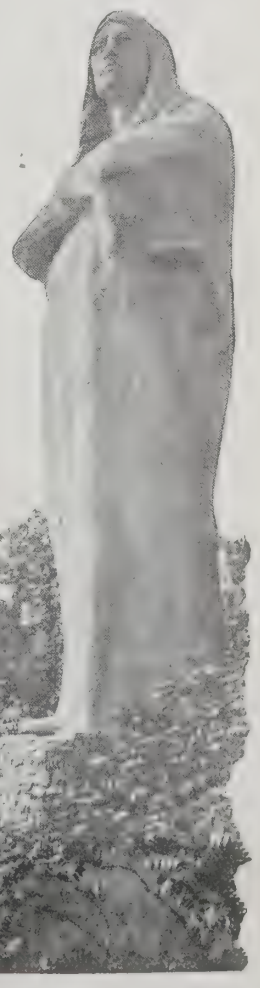
Mr. Taft's most important achievements date from the time of the Columbian Exposition, when he undertook the decoration of the Horticulture Building and whose two groups, "The Sleep of the Flowers" and "The Awakening of the Flowers," on either side of the main entrance, brought recognition and opportunities for later commissions.

His earlier works include busts of Joaquin Miller, Israel Zangwill, Hamlin Garland, Frances E. Willard and Susan B. Anthony. Later busts are those of Governor Oglesby, of Illinois, and Henry W. Longfellow (for the University of Illinois), Clement and J. M. Studebaker and General John A. Logan (for the Grand Army).



Recent professional works include "The Blind," an ideal group inspired by Maeterlinck's drama of the same name; the Columbus Memorial Fountain at Washington, D. C.; "The Solitude of the Soul" at the Art Institute of Chicago; the Fountain of the Great Lakes, adjoining; the Washington Monument at Seattle, Washington; Blackhawk and the Ogle County Soldiers' Memorial at Oregon, Illinois; the Thatcher Memorial Fountain at Denver, Colorado; and—recently set up—the vast Fountain of Time, on the Midway Plaisance, Chicago.

As an author, Mr. Taft has published a "History of American Sculpture"; and another work, six lectures on "Recent Tendencies in Sculpture," is recently off the press. Also, in 1919, he lectured for six months to members of the A. E. F. at Beaune and Bellevue, France.



Mr. Taft's Chicago studio is situated on the Midway, in the immediate vicinity of the University of Chicago, between Washington and Jackson parks. The "Midway Studios" combine a double range of buildings erected around a central court and provide quarters for the artist himself, for seven or eight associate sculptors and for many assistants—some twenty persons in all. Here can be seen in operation most of the processes connected with the art of sculpture.

Mr. Taft's summer residence, as has been previously stated, is on the Rock River near Oregon, where for twenty-three years he has been head of the artists' camp.

"I am so keenly interested in modern community building and the city beautiful," observed Mr. Taft as the moment arrived when I could no longer properly detain him. "I recognize that patriotism begins at home. Learn to appreciate and love the home town and you have a good start for wider interests. We love our home towns, but how much more might be done to make them attractive. Anyone who points out their beauties or their needs is a public benefactor."

The Jews and the "Religious Persecution" Cry

Showing the Attitudes and Activities of the Jews Against the Religious Rights of the Majority: A Reply to a Propagandist Lie

WE CHEERFULLY give the Jews of the United States credit for knowing when they are getting their money's worth. In the defense that has been set up for them they know that they have not had their money's worth, neither from Jewish money collectors nor from the "Gentile fronts" to whom the money has been paid. The Louis Marshall line of defense has broken down. The boycott has dribbled into nothingness. Speeches in Congress and editorials in newspapers have sounded too hollow to carry conviction. The Question has proved itself far too big for those who have entered the defense for gain, to satisfy personal grudges, or to win what they feel to be the favor of the stronger side. The Jews long ago quit the course which some of the "Gentile fronts" still continue; the Jews recognized the futility of it.

No intelligent Jew in the United States ever was asinine enough to declare that the Jewish Question is a religious question and that THE DEARBORN INDEPENDENT's investigation of that Question constituted "religious persecution." No Jew known beyond the next street has ever ventured such a silly charge. But it is apparently all that remains for the "Gentile fronts" to shout about. From what can be learned of them they are for the most part men of no religion themselves and they use the term "religious persecution" as a red rag which they think will stir people into action. It is rather curious how the cry of "religious persecution" is used to evoke the spirit of persecution against alleged persecutors.

THE DEARBORN INDEPENDENT this week goes out of its course to squelch once and for all this cry of religious persecutions.

The Situation Under Three Points

THREE statements are sufficient to outline the situation:

First, neither directly nor by implication has THE DEARBORN INDEPENDENT held that the Jewish Question is a religious question. On the contrary, supported by the highest Jewish authority, this paper has held that the Jewish Question is one of race and nationality. (See issues of October 9 and 16, 1920; reprinted in the new book, volume two of "The International Jew.")

Second, there is no religious persecution of the Jew in the United States, unless the agitation of various humane societies for the abolition of "kosher killing" may be considered such. The Massachusetts Society for the Prevention of Cruelty to Animals has published a valuable study of the Jewish method of slaughtering animals for food, in which is adduced much scientific evidence to support the conclusion that the Jewish method is "needlessly cruel." But even this can only with difficulty be stretched into an interference with "the religion of the Jews." The Jewish method of slaughter as now practiced is not commanded in the Old Testament but in the Talmud, and is, therefore, not religious in the authoritative sense, but traditional. Moreover, there is positive evidence that modern methods achieve the Jewish purpose (the disposal of the blood of the carcass) much better than does the Jewish method. This is the only instance where even remotely the religion of the Jews has been touched.

Where "Persecution" Can Be Found

THIRD, the fact is that while there is no "religious persecution" of the Jews, there is very much real religious persecution *by* the Jews. That is one of the outstanding characteristics of organized Jewish life in the United States, its active, unceasing, powerful and virulent attacks upon any and all forms of Christianity which may chance to come to public notice. Now and again we hear of outbreaks of sectarian bigotry between Catholics and Protestants, but these are not to be compared with the steady, relentless, alert, anti-Christian activity of the Jewish organizations. There are doctrinal disputes within the Christian churches, but none that challenge the basis of Christianity itself; organized Judaism, however, is not content with doctrinal disputation, but enlists its vast commercial and political power against everything that it regards as, in its own words, "Christological manifestations."

Now, these are facts, and being facts, they are important, and they ought to be publicly known.

No President of the United States has yet dared to take his inaugural oath on the open pages of the New Testament—the Jews would denounce him. When General Pershing announced that he considered the morale of the American soldier due to the interest of the Christian men and women at home, the Jews had him cut out the word "Christian." Various governors of American states, having used the word "Christian" in their Thanksgiving proclamations, have been obliged to excise it on demand of the Jews. The word "Christian" was compelled to be cut out of the officers' training manual at the Plattsburg training camp. Everything that would remind the child in school that he is living in the midst of a Christian civilization, in a nation declared by its Supreme Court to be founded on Christian principles, has been ordered out of the public schools on Jewish demand.

People sometimes ask why 3,000,000 Jews can control the affairs of 100,000,000 Americans. In the same way that ten Jewish students can abolish the mention of Christmas and Easter out of schools containing 3,000 Christian pupils.

In a nation and at a time when a minority of Jews can print every year a record of the apologies they have extorted from public officials for "having inadvertently used the term 'Christian,'" it is desirable that this charge of "religious persecution" should be placed where it belongs. In the *Daily American Tribune,* a Catholic daily published at Dubuque, Iowa, appeared a recent headline which said a great deal—*Not Persecution of The Jews, But Protection of The Christians.*

VOLUME two of this series of Jewish Studies is now off the press. It is entitled "Jewish Activities in the United States," being the second volume of "The International Jew." Twenty-two articles, 256 pages. Sent to any address at the cost of printing and mailing, which is 25 cents.

Red Cross and Gideons

IT IS now proposed to let the Jews speak for themselves on this question. The Jewish press has been searched for an authoritative expression charging that the study of the Jewish Question constitutes "religious persecution," and none has been found. That cry has been reserved for "Gentile fronts" for use among Christians. All the attacks from the Jewish camp are against the doctrines and institutions of the Christians. They have carried on an insistent and successful persecution, and the details of it have filled the Jewish press for years past.

Upon reading the following selections, the remark of Dean Swift will probably come to mind: "We are fully convinced that we shall always tolerate them, but not that they will tolerate us."

The Red Cross is objectionable to the Jew. H. Lissauer, in *The Jewish Times,* proposed that the Magen David be substituted for "the red cross" on the Red Cross Society badges worn by Jews.

"We should not let our sensitiveness to charges of intolerance overcome our conscientious religious objections to the cross," says Mr. Lissauer. The editor of *The Jewish Independent* thinks the suggestion "is worthy of serious consideration."

The Gideons are objectionable to the Jew. The Gideons is the name given to the Christian Commercial Travelers' Association of America, whose efforts are responsible for the Bibles which are to be found in most hotel rooms. This is from the Cleveland *Jewish Independent*:

"It is quite evident that the Gideons do not know a typically Jewish name when they see or hear one. The Gideons' object, according to their letterheads is 'winning commercial traveling men for Christ' and the way this is done is by placing a Christian Bible in each guest room of every hotel.

"The Gideons have been at it a long time, long enough to know better, but the other day they sent a letter to Max Cohen of this city, who is a traveling man but the kind the Gideons have no right to ask for funds, and the person who selected him for an 'easy mark' certainly should have had better sense. . . .

"Mr. Cohen utterly failed to 'fall' for the invitation and instead of sending his little donation he wrote a letter to the secretary, C. A. Johnson, in which he bluntly said: 'Don't you think you ought to use better judgment than to ask me to contribute to a strictly religious work opposite to my own belief?'

"If the Gideons insist upon filling up hotels with Bibles that have no business there, they should go to the right persons for contributions."

The Jews do not like the Salvation Army nor the Y. M. C. A. Many thousands of printed lines expressed the fury with which they regarded attempts to "Christianize the Army and Navy" during the war, and the wild arguments with which they sought to make "Y" work and Salvation Army work appear to be a violation of the principle of no union of Church and State. The same objection was made to religious welfare work during the building of the Panama Canal. If there is any challenge of this on the part of uninformed "Gentile fronts" (the Jews themselves will not challenge it) the evidence can be produced. It is only a matter of space.

The Jews did not like Theodore Roosevelt's choice of a hymn for the Progressive party:

"With Hon. Oscar S. Straus as the nominee for the governorship of New York on the Progressive ticket, this question rises: Will the voters on the East Side of New York City march to the Progressive battle hymn, 'Onward, Christian Soldiers,' or will the song have to be changed to fit the candidate?"—*American Israelite.*

The Slur on Missions

THE Jews hate with a malice beyond expression what they call "mission holes," that is, a place of instruction maintained by Christian churches where inquiring Jews may learn what Christianity is and, in many instances, where destitute and neglected Jews may receive assistance and counsel. The boast of how "the Jew cares for his own" is given a jolt by the dire need which has called Christian welfare work into Jewish settlements.

This hatred overrode good judgment so completely that in 1911 Assemblyman Heyman introduced into the New York State legislature a bill making it an offense punishable by fine or imprisonment to entice or tempt a minor under sixteen years of age into a religious mission, Sunday school or church without the written consent of the parents or guardian of the minor! The language indicates a part of the contempt in which the welfare work undertaken by Christian institutions for the neediest class of children in America is held by the leaders among the Jews; not by the masses of the Jews themselves, however, except when they are terrified by their leaders.

In St. Louis, application for a charter of the Jewish Christian Association was opposed. The converted Jews wanted an association of their own. They represented that they had been ostracized by the Jews and were desirous of organizing and owning their own meeting place. A referee advised against the charter on the ground that "it would be contrary to the broad spirit of religious freedom guaranteed under the constitution of Missouri." The referee was, of course, coached by Jews. In the name of religious freedom these Jews opposed giving an association freedom enough to preach the gospel.

Curtailing American Religious Freedom

IN TORONTO the Jewish leaders issued a proclamation throughout all Toronto Jewry forbidding the use of reading rooms, baths, dispensaries, motion picture shows or anything else which they described as "the petty bribery of conversionist tricksters who seek for their wealthy donators to open the gates of heaven and find salvation for their sins by converting a weak-minded Jew."

By the way, all converted Jews are weak-minded or criminal, if we are to believe the hundreds of statements to that effect in the Jewish papers. The Jews are, without exception, superior people until they become Christians; *then* learn what they are from the Jewish leaders!

Among the nice names for this welfare work are "Jesus holes," "mission traps," "Jew-snatchers," "child stealers."

It happened that one of the helpers in the Chicago Gospel Mission was principal of a Chicago public

school. The Jews raised a great outcry against him, denounced him as unfit to teach children, and guilty of "the moral turpitude of eating food provided by taxes of which a large share is received from Jews, whose children they seek to entice from their parental religion and whose men and women they are seeking to degrade into liars and hypocrites." All because a competent man was willing to meet Jewish inquirers, or perhaps bring a few of the benefits of civilization into the neglected ghetto. If this school teacher were Christian enough to have a conscience, he would resign, said the Jewish thunderers, and with that never-failing tinge of dark-mindedness they added: "What is done in secret in these haunts can, of course, only be guessed at."

Talk about bigotry! This from a people who encourage the cry that THE DEARBORN INDEPENDENT is engaged in "religious persecution," though THE DEARBORN INDEPENDENT has not yet carried even one of the scores of sensational and important stories which show the Federal Government discovering synagogues and rabbis as agents of the illicit liquor traffic. "These *haunts*" and hints of the things that may go on there, is the only way the *American Israelite* can find to refer to welfare works in which some of the best people, from no motive but the goodness of their hearts, engage.

A book of 500 pages could be filled with the unreasonable and in many cases positively vicious statements of leading Jews on any of the subjects touched here.

The Jews do not like the Christian Sabbath. The literature of attack against this institution is voluminous and the arguments extreme. Sunday is Christian, therefore to the Jew it is taboo. Court records in every state bear testimony to the fight of the Jews against Sunday. Few legislatures have escaped being pestered with bills on the subject. The latest fight has been the strongest yet waged, to destroy Sunday by throwing it wide open to Jewish exploitation. Yet the Jews are most chary of their own Sabbath. When recent college examinations fell on Jewish holy days, the Jews had the examinations changed. When primary elections last year fell on Jewish days, every power was moved to change them. There are Jewish records of a western governor being remonstrated with because a condemned criminal was sentenced to be hanged on Saturday—did the governor mean to "offend 3,000,000 Jews"? The St. Louis Charity Fair in 1908 planned to remain open on Friday evening; a great outcry; did the managers of that fair mean to insult the Jews; didn't they know that the Jewish Sabbath began on Friday night?

But when it is a question of maintaining the integrity of Sunday—pooh! pooh! "Don't the Christians know that Sunday perpetuates the silliest superstition, that their god Jesus rose from the dead?" When certain people aid the post office employes in an attempt to close the post offices on Sunday, the Jews regard it as a step back toward the dark ages.

Denouncing Governor Cox's Sunday Policy

HERE is a Jewish editorial relating to Governor Cox. It appears that Governor Cox in 1914 stood for a decent Sunday and liquor law enforcement, and this is the threat held out to him:

"At the 59th Jackson Day banquet of the Wayne County (Ohio) Democracy, which was held at Wooster, Governor Cox made the principal address in which he defended laws passed at his instigation. The governor laid particular stress on the fact that for the first time in her history, Ohio now enjoys a 'Christian Sabbath.'

"'I stand or fall by the Christian Sabbath in the next campaign,' the governor is reported to have said . . . .

"There are many who construe the declaration to mean that Governor Cox has bid defiance to the liberal element of the state and will rely upon the religious and class prejudices which he is arousing and keeping alive in the rural districts, to re-elect him to his present office, or, what is clearly plain from his entire attitude, boost him into the nomination for United States Senatorship. The *Israelite* will take great pleasure about the time the leaves begin to turn in reminding Governor Cox of his statement that he 'will stand or fall by a Christian Sabbath' in the coming campaign."—*American Israelite.*

The literature of Jewish thought toward Sunday presents complete evidence of the leaders' antagonism to this distinctly Christian and Anglo-Saxon institution. Sunday has never been regarded as set apart, in those countries where the Jewish idea has most infiltrated. The decline of Sunday in the United States is directly along the line of those invasions of the Sunday spirit which are mostly aligned with Jewish commercial interests. In Great Britain and her colonies where the Jew is not permitted to usurp a superior place as chief censor of morals and religion and education, Sunday is decently observed. The situation in this country is that, instead of enjoying its liberty, the Jewish leaders have taken liberties. The student who wishes to know how deep and hard-set is the anti-Sunday program will find all the material he wants in Jewish sources.

The Bible—Where, Now, Is the Prejudice?

THE theme of this article is "religious prejudice." You will not find it anywhere within the whole range of the Jewish Question, except on the Jewish side. There is, in the United States, a religious prejudice, but it is strictly Yiddish. If the Christian population bothered one one-hundred-thousandth part as much about Jewish religion as the Jews bother about Christian observances, the whole fabric of Talmudical teaching would be consumed in the bright light to which general attention would bring it, the bright light from which it has always been concealed. Sheer analysis in the interest of mental health, if undertaken by fifty men, would compel the Jewish people by their own decision to abandon the darkness which holds them now. Jewish Talmudism owes its existence today to the indifference with which it is regarded. This is the far opposite extreme of "religious persecution."

The list of headlines describing the various angles of Jewish anti-Christian religious prejudice is not, however, exhausted.

The Jew is prejudiced against the Bible. When he uses that term, he does not mean what the ordinary person means. Therefore, he does what he can to destroy public honor of the Book, unless it be an occasion where a President has been inaugurated, when it will run through the Jewish press like a strong breeze that once more has a Christian statesman ignored the Christian Bible and turned to the Jewish Bible. It is rather a trifling matter to mention; its significance comes solely from the light it throws on the Jewish attitude. It is not a trifling thing in Jewry, as the country will probably be made aware if any future President should be sworn in with, say, the Sermon on the Mount open before him.

And yet, even here, we observe a strange paradox. A Jewish authority says: "The Jew is a paradox. He is at once an idealist and a materialist. He is parsimonious and extravagant. He is courageous and cowardly. He is modest and vulgar. He is persistent and yielding. He is peaceful and warlike"—and so on. And though the Jew opposes the Bible in the schools, he never misses a chance to put it there, with the Jewish trade-mark. He quotes the Psalms—"We wrote them." He quotes Isaiah—"We Jews did that."

Teaching Hebrew Is "All Right"

MOST people sit open-mouthed at these glorious authors of Scripture and do not know how to answer. It is time the Churches began to learn what to say to the Jewish taunts—"We gave you your god;" "We gave you your bible;" "We gave you your savior." Perhaps it is also time that the Jews themselves considered how long the boast will stand the usage they are giving it.

In any case the literature which the Jews wrongfully claim as their own production, is rather far distant in time to justify its being used as a mantle of glory for the political rabbis, the discredited theatrical and movie magnates, and the violent penman of the Jewish press. Rather too distant in time! We, the race that confronts the Jews, have done somewhat more recent work; for example, the Declaration of Independence and the Emancipation Proclamation, not to mention the psalms and pronouncements of the great American prophets that have lifted up the world.

So, the Jew is very willing that the Bible should be in the schools, provided it is not what he calls "the Christian Bible." Listen to this:

> "Hebrew is to be taught in the Chicago high schools. Students who include this language in their course are to receive the credit now allowed for the study of other classical languages. Of infinite value in the training of the mind are the wonderful narratives of Genesis, and boys and girls will find the history of Israel under the Judges much more appealing than Caesar's bridge over the Rhine."

The people of New Jersey thought so, too; they believed that a reading from this ancient book every day would mean much to the general culture of the pupils. But what did the paper just quoted say about it? It called the cultivated Bible appreciators of New Jersey "soul-snatching enthusiasts" and raised a mighty yell about "the forcible conversion of Jewish children," although it was provided that Jewish or any other children should be excused from the reading if desired. Another mighty yell about excusing the children all on account of the tyranny of reading the Christian Bible in the schools—regardless of the fact, which every public school teacher knows, that no class of children is oftener out of school for religious reasons than are the Jews.

Truly, these people are a paradox. They are not fair. They are constituted so that they cannot see the other side of anything. For a time they actually do convince the secularists that everything public should be secularized down to the last notch of atheistic demand. Non-Jews are fair. They are willing to see the other people's point of view. When it was said to us that the "Merchant of Venice" was a cruelty upon Jewish school pupils, we said, without investigation, "Out goes the Merchant, then!" We discovered later that the Jewish children liked and appreciated that play better than any other group. Brander Matthews helped us discover that.

And so when they said, "Reading the Bible is sheer proselytizing; it isn't fair," the non-Jew, who wanted to prove that he is fair and unprejudiced above all things else (a weakness the Jews know how to manipulate), said, "Well, then, out goes the Bible!" And it went out. Very well! What next? "You must abolish Christmas, too." "You must not keep Easter—the Jews don't like it." "It is anti-Semitic to observe Good Friday." In other words, to please the sensitive Jewish natures we must eradicate from Christian civilization all that is Christian in it.

The Propaganda of Judaism

IN THE meantime what transpires? Having induced "fair-minded" non-Jews to do all these things—and every one above enumerated has been done over and over again at Jewish demand—the Jews then proceeded to sow Judaism on the fields thus denuded of Christianity. "No religion in the institutions of the State"—yet in every state university last year there were, and in every state university this year there probably will be, courses of lectures delivered by Jewish rabbis—the lectures delivered in the colleges themselves—propagandizing the youth of the non-Jews with Judaistic religion, ethics, and economics. That is what the so-called Jewish "Chautauqua" exists for. It is not a Jewish "Chautauqua"; it is Jewish propaganda in public educational institutions.

That is the repayment the Jews have made for our "fair-mindedness." Their demand for complete secularization is merely their preparation of the soil for their carefully organized sowing of the seed of Judaism. And non-Jews permit it to continue, for there is nothing they fear so much as that their opposition will be regarded as "religious prejudice."

The Jew glories in religious prejudice, as the American glories in patriotism. Religious prejudice *is* the Jews' chief expression of their own true patriotism. It is the only well-organized, active and successful form of religious prejudice in the country because they have succeeded in pulling off the gigantic trick of making not their own attitude, but any opposition to it, bear the stigma of "prejudice" and "persecution." That is why the Jew uses these terms so frequently. He wants to label the other fellow first. That is why any investigation of the Jewish Question is so quickly advertised as anti-Semitism—the Jew knows the advantage of labeling the other man; wrong labels are most useful.

This does not by any means exhaust the list of headlines describing the various avenues in which the expression of virulent Jewish religious prejudice and persecution is found. But it exhausts the space allotted to these articles each week. Therefore, the subject will be concluded next week.

Not Pleasant, But Necessary

IT IS not a pleasant subject. Religious prejudice is just as unpleasant to write about as it is to experience in any other way. It is totally contrary to the genius of the American and the Anglo-Saxon. We have always regarded religion as a matter of conscience. To believe as he will is part of every man's fundamental liberty. To interfere with force to change anyone's belief is exceedingly stupid.

Holding these hereditary principles, one chooses to study that active stream of influence in American life which is known as the Jewish stream, and immediately upon doing so, one finds himself classed with the bigots and torturers of other times.

It is now time to show that the cry of "bigot!" is raised mostly by bigots. There *is* a religious prejudice in this country, there *is*, indeed, a religious persecution, there *is* a forcible shoving aside of the religious liberties of a majority of the people, and this prejudice and persecution and use of force is Jewish and nothing but Jewish.

This is the answer to the cry of "religious persecution," and we shall make it so complete and definite that a repetition of the cry against students of the Jewish Question will automatically mark the criers as either too ignorant or too vicious for consideration.

Volumes One and Two of *"The International Jew,"* 236 and 256 pages respectively, sent to any address upon receipt of 25 cents each in stamps to cover printing and mailing cost.

Salvaging American Prisons

By AARON HARDY ULM

"THE prevailing method of dealing with crime and criminals is all wrong, fundamentally wrong. To seek improvement by merely tinkering with the system is almost useless. The system must be completely changed. I am devoting my life to fighting crime, the crimes against so-called criminals as well as the kind they commit. Criminality now costs the country not less than five billion dollars a year, which is more than we spend on popular education. The prisons are festering sores on the body politic, the breeding places of an insurgency that in a time of stress might threaten the life of society itself. They have long been training grounds for the I. W. W. and other violently radical organizations, several of which have a systematic method of recruiting from the jails and penitentiaries. This must be stopped by treating crime and criminals in a common sense way."

The speaker was Edward H. Morrell, himself an ex-convict with a record of sixteen years in prison, five of which he spent in solitary confinement in a dungeon.

Since his release in 1908 from San Quentin prison in California, Mr. Morrell has devoted his time to fighting for prison reform—though he denies that he is a "reformer" in the usual sense and has rarely worked with those who so style themselves. The average "prison reformer," he says, is satisfied with efforts to improve the present, and age-old, system of dealing with crime and criminals, accepting its fundamentals as sound and its principles as workable in the matter of estopping crime and correcting criminals.

Sentiment Not Considered

"WHEN one pronounces our method of dealing with crime and criminals as wrong, one is naturally open to the charge of wanting to coddle criminals and excuse crime," he said. "Why not think of those who suffer from the acts of criminals? is a very natural and pertinent question to ask of those who urge a change. Well, it is from that basis that I advance my creed. Under our present system, the innocent victims of criminals are veritably ignored. What state now makes provision for indemnifying, say, the widow of a man who has been ruthlessly murdered? It will spend thousands of dollars on the murderer. Often a small fortune is spent out of the taxpayers' money on long drawn out court proceedings that largely are legal mummery and nothing else, when a board of trained specialists could determine guilt or innocence in an hour's time and virtually without expense. Other thousands will be spent on detaining the criminal, if convicted, while he serves his sentence; and he is turned loose, at the end, not less dangerous, but much more dangerous than ever to the public peace. Meantime, the innocent victims of the criminals' wrongs are forgotten, scorned. They may be a woman and a group of small children deprived of a husband and father; and because of the deprivation those children may become criminals themselves.

"Now the innocent sufferers from criminal acts have just and meritorious claims against society, claims that society should meet. It should meet them by compelling the criminal to make up as far as possible for his wrongdoing. That is to say, if one man murders another, we should see that the wrongdoer takes care of the dead man's family. If a thief steals from you, see that he returns dollar for dollar that which he takes.

"At the same time make the law-breaker self-supporting, and by making him self-supporting prepare him to return to freedom equipped for maintaining himself honorably.

"This is not a question of what many are fond of terming 'maudlin sentimentality.' Sentiment has little if anything to do with it. It is a question of social economy and justice. Our present system makes for waste, terrific, inexcusable waste—and rank injustice. The injustice isn't so much to the person convicted of and punished for crime as to the victims of his crime. And the sufferers from crime are not confined to the direct victims of criminal acts, they include all who in the end must meet the outrageous direct and the almost unlimited indirect cost of crime."

Once in San Quentin's Dungeon

WHILE Morrell's views are in some respects "extreme," he is not of the extremist type. He speaks an everyday language. His personality is of the red-blooded kind, so much so, in fact, that his friend, Jack London, put him into a book, "The Star Rover." As a youth, Morrell was a member of a gang of California outlaws and with them took part in many spectacular feats of banditry. He was caught, when in his teens, and was sentenced to life imprisonment. He at first resented the confinement and was finally classed as an incorrigible and was made a "solitary" dungeon prisoner at San Quentin. There a humane warden found him and discovered that the severe punishment he had undergone was due to a false accusation, gave him sympathy and encouragement and ultimately made him a "trusty." He rose to be "chief trusty," and thus became interested in helping other prisoners. In 1908 he was pardoned.

He immediately took up the work of fighting for improvement in our prison systems. He induced the California legislature to enact a workable parole law, and became the father of the famous honor system among prisoners. He is given the credit for causing the honor system to be adopted by Arizona and Oregon.

His long study of the subject has convinced Morrell, however, that lasting results can be obtained only by changing our entire policy in dealing with them. He organized the Twentieth Century Prison League to promote his program. The league has been taken over by the Bureau of Commercial Economics, the altruistic motion picture organization that operates on an international scale from Washington. It is now the bureau's department of prisons, with Morrell as director. It is proposed to advance his ideas largely by means of pictures to be distributed freely all over the country. Morrell is now preparing for a motion picture exhibition and lecturing tour that will take him across the continent. He will make the trip in one of the bureau's traveling trucks, which will enable him to exhibit pictures and lecture anywhere en route.

"Does not what you advocate call for drastic changes in our criminal laws?" I asked him.

"Certainly, changes of the most fundamental character," he replied. "The first, I should say, would be an amendment to the Federal Constitution, putting the handling of crime and criminals exclusively in the hands of the national government. This, because the handling of crime is not a local problem, but one of national importance. We know the argument put forward in behalf of prohibition, the impossibility of a 'dry' state keeping out the inflow from 'wet' states. How much more difficult it is to keep crime from sweeping from one community or one state to another! A crusade against law-breakers in New York serves largely only to shift so-called 'crime waves' to other cities. Even now, it often happens that courts let law-breakers off without punishment on condition that they leave the community to pursue their operations elsewhere.

"We must have one uniform method or system of dealing with crime everywhere; one code of practice for courts and prisons, so to speak. The only practicable way to get that is by giving the Federal Government control of the entire procedure, at least from the courts to the prisons, and remove it entirely from politics.

"When we get that amendment, the nation must summon the world's best experts and get them to draw up codes aimed sincerely and scientificially at reducing crime and eliminating criminals from the body politic. Reduce crime by making it unprofitable and eliminate criminals by salvaging them to society.

"Psychology, medicine and other sciences have thrown on crime many lights of which the science of law, predicated on the medieval theory of total depravity, takes no cognizance. The criminal law, as we now have it, is based on the false assumption that artificial punishment is a deterrent—that the way to cure the criminal is to make him suffer, not from the natural effects of his crime, but from the effects of laws applied with more or less cold rigidity to all alike. Treatment is fixed by the character of the crime; not as it should be by the character of the criminal.

No "Criminal Class," He Says

"THE 'criminal class' theory is a fallacy. True, some people are born with tendencies that you might rate as criminal. But those very tendencies may function through a dozen other ways of vicious or inefficient conduct that are not defined by the law as crimes. Many acquire such tendencies through ill-health, malnutrition and lack of care in their early years; some even by accident. I know of two boys, the sons of the same parents, born to the same environment and reared with the same care. One was studious, orderly, obedient; the other, careless, indifferent, even vicious. When the latter was subjected to a thorough physical examination, a tooth, infected at the root, and which had never given him pain, was discovered. It was removed, his system was cleared of the poisons the infection had spread through his body and temporarily changed his nature, and he became as exemplary as his brother. Now if the child had gone on with that infected tooth, he probably would have landed in a reformatory, or, later on, in a penitentiary and have been turned out from either place a worse instead of a better person.

"Only seven to eight per cent of crime is committed by what you would call 'professional criminals,' that is, by persons who have made criminality a trade and consider it an art and take pride in it. If that type of criminal were let go entirely, the total of crime committed would be insignificant. The great bulk of crime is what for a better term you may call accidental. It is due more to inefficiency than to criminal instinct.

"Seventy to eighty per cent of all law-breakers are nothing but misfits. Studies show that 56 per cent of the children in the average common school are misfits, that is, not fully equipped for the struggle for existence. All these misfits are potential law-breakers, though only a small proportion actually become such. We must find how best to deal with those whose deficiencies function criminally.

"Under our present court procedure, many guilty go free and some who are innocent are convicted. We should leave the determination of guilt to boards of magistrates trained in weighing evidence, and free them of those technical restrictions once necessary to prevent oppression, but which are now used mostly for the manipulation of the law by skillful lawyers to make out their particular cases.

"When guilt is established, the offender should be turned over to another board, made up of scientific experts, who will grade and classify him with reference to what may be done for him and for what he may do by way of repairing the wrong he has done others.

"In the pitiful case of a moron with congenital vicious tendencies, he should be locked up for life and required at least to earn his own support. They should be permanently restrained, not primarily because they commit a crime, but because they cannot take care of themselves with safety to society.

"But suppose they refuse to earn their keep?" the writer inquired.

"Well, let the law of nature take its course; if they insist on starving let them starve," was Mr. Morrell's prompt response.

EDWARD H. MORRELL,

One-time bandit and for sixteen years a "lifer" in the prisons of California, who says the prevailing system of dealing with criminals is all wrong, and is beginning a national campaign for fundamental changes in our penal policies

"A very large proportion of persons sent to our prisons need medical treatment more than they do punishment. Instead of impairing them further, as our system does, we should repair them and fit them for honorable combat with life.

"Thus the scientific board to which I would have every convicted criminal submitted for diagnosis and sentence would prescribe for the criminal as a doctor would for a patient. If the mind is in need of repairs that can be made, send him to a psychopathic infirmary; if the body is the point of weakness, to the operating table or to a rehabilitation hospital. Turn out none until they are well and trained in a trade that will enable them to earn honest livings.

"Get rid of the stench holes we call jails. With all the faults of our penitentiaries our county jails are ten-fold worse. Not only do guilty persons go to them, but many innocent persons are also held in them pending trial. They are festering sores of disease, physical and mental. You can get rid of them by shortening the period between the arrest and the trial of offenders.

"Take your armed guards and your iron gratings from your penitentiaries. It has been done in Oregon and works successfully. It is done at Occoquan, the District of Columbia prison. Develop in every prison a healthy public sentiment among prisoners, who, if you permit them, will see to it that honor regulations are not broken to any great extent, even by the 'incorrigibles.'

Prison Population on Increase

"FORGET about the 'criminal class.' As I have said, there is no such thing. The people in our prisons are in great degree just like the people we meet on the street, a little less intelligent perhaps, not so healthy maybe, but discouraged and often envenomed. When the Allies were pressed to the wall they didn't hesitate to draw on the prisons, for soldiers and ex-convicts made splendid fighters. Many received the very highest honors for notable conduct. We did the same during the Civil War; and in the recent war I offered to recruit an army of 50,000 from our prisons, and it would have been as good an army as was in the field.

"But the salvage from our prisons is by no means what it should be. In 1910 I found that we had a steady prison population of approximately 500,000. It is now, I believe, around 700,000. It is almost a total dead-weight charge on society. Only seven or eight per cent of persons in prisons are permitted to do constructive work. I say 'permitted' for the reason that the resource of work is so desired by the average prisoner that many wardens know that the withdrawal of a work privilege is the worst punishment they can inflict on recalcitrant charges.

"So far as the harsh system of dealing with criminals being a deterrent, the entire history of criminology shows it to be the contrary. Every jurist knows that as the legal penalties for crime have been lowered, crime has decreased. The introduction of more humane methods in our penitentiaries has invariably been followed by less recidivism. In the old day, in some places 40 to 50 per cent of the prisoners released from penitentiaries came back. The returns now are very small for the country as a whole.

"Let the man who would commit a crime know that, as far as possible, he will be required to repair his wrong; not by way of receiving punishment, but by being forced to pay dollar for dollar to his victims.

"Beyond that see that he is treated humanely and constructively, that he need not have occasion to violate the law to live when he gets out.

"It all calls for a complete change in our system of dealing with crime and criminals and that change can be well made only by reducing the system to national uniformity and control."

Up the Stream—at Tobyhanna, Pennsylvania

When Knighthood Went to Seed

DOUBTLESS the days of chivalry—the days when knights were bold—were days of greatness, but knighthood when in full bloom never produced knights so bold as those who could be found in the lobby of any first-class Canadian hotel in the days before the institution of knighthood in Canada went to seed. That happened in May, 1919—on the twenty-second, to be explicit—when an address to the King passed the Canadian House of Commons by a vote of 96 to 43 in which His Majesty was asked to refrain, in future, from conferring any title or titular distinction upon any person living in Canada. It also asked that suitable legislation be instituted in the Imperial Parliament whereby all hereditary titles now held by Canadians might become extinct upon the death of the present holders.

There was a time when knighthoods were conferred upon only a few persons in Canada, and then the recipients were usually men to whom honors—if such were going round—might fittingly have been granted; but of late years it seemed that everyone who had made a few millions—by fair means or by foul—felt that his career was not properly rounded out unless he could parade a handle to his name; and, what is more to the point, he generally succeeded in his endeavors to this end—in most cases to the great pecuniary advantage of the campaign coffers of the political party in power.

"The Contributor Knight" is dealt with by Colonel Andrew T. Thompson, an Ottawa writer, in his humorous verses entitled: "The Canadian Knights' Entertainment," which were published at the time of the controversy, and which ran as follows:

And now a quiet smooth-faced man
Appears to speak his part,
A pros'prous man of middle age,
And not too big a heart.

"I won my title well," said he,
"I saved my country dear,
Subscribing to election funds,
When there was cause to fear

"Unless the boodle pot were full,
The other side would win,
And so wipe out all vested rights,
Which surely were a sin.

"I spent my thousands lavishly,
And when we won the day,
They handed me my knighthood, and—
That's all I have to say."

The traffic became so notorious that a knighthood was almost looked upon as a badge of infamy, which may be illustrated by the remark of a western wit who, noticing the name of an eminent Toronto scientist among the names of railway, commercial and financial barons in the birthday or New Year's honor list, declared that he "had always believed Blank to be an honest man, but his inclusion in such a list was not at all reassuring!"

Colonel Thompson's verses describing the "Railway Knight" are typical of the attitude of the public generally toward those who saddled Canada with an excessive railway mileage—at the expense of the public treasury—to their own personal enrichment. He says:

A sterner man succeeds the last,
A man of threat'ning mien,
And masterful—a leader he,
It's easy to be seen.

"Ye prate of ancestry," quoth he,
"And blood both red and blue,
But my descent can straight be traced—
I swear to you it's true—

"From brave Sir Henry Morgan,
Of buccaneers the King,
Who swaggered through the Spanish Main,
And robbed like anything.

"Of Spanish ships he took his toll,
He raided many a city,
His fame's kept fresh unto this day,
In roaring sailor ditty.

"'The Freedom of the Seas' was his,
For none dare say him nay,
He took his tithe from anywhere,
His motto, 'Make them pay.'

"From his hot veins my blood I draw,
His watchword, too, is mine.
I love to ponder on his might,
In the days of Auld Lang Syne.

"'From near Atlantic's sounding wave,'
To far Pacific's shore,'
I've looted every treasury,
I've gathered more and more.

"Until, my primacy confessed,
They made me a Knight,
In ermine's white and spotless fur,
I'm safely now bedight."

The retirement of Sir Robert Borden from the premiership of Canada and the resignation of Sir Lomer Gouin, premier of the province of Quebec, both of which took effect within the past year, marked the passing of the last of Canada's titled prime ministers. The present premier is plain Mr. Meighen—with the customary designation of "Honorable," of course—and, unless the people of Canada reverse their ideas, there will never again be a Canadian prime minister with a handle to his name.

There are still a number of lieutenant-governors—each province has a lieutenant-governor as the figurative head of the local government—but the office of a Canadian lieutenant-governor is about as useful as the gilded knob on the top of a flag-pole.

The governor-general, of course, has a string of titles—the present incumbent being a British duke—and is beyond the jurisdiction of the Canadian parliament, but even so exalted a post is being assailed by Canadian iconoclasts and it is not improbable that in the very near future the governor-general of Canada will be a Canadian, appointed upon the advice of the government of Canada; and, unless he happens to be one of those already possessing a title, he will be plain and unadorned.

Knighthoods and other titular distinctions are the trappings of royalty. Of late years—while all titles are considered to be direct from the King—it is well known that the King does not confer honors without the advice of his responsible ministers any more than he performs any other official act without their advice: so it really comes down to a question of the honors being the gift of the political party in power. In the early days of Canadian history, titles were conferred upon the advice of the colonial secretary in London, but of late years Canadian ministries have insisted upon being consulted in the matter, and thus it had come to be that Canadians who were honored with titles really received them at the hands of the prime minister of Canada.

Democracy and monarchy are incompatible; and every advance in the former must necessarily be at the expense of the latter. Thus it is that the King's prerogative has been gradually circumscribed. Even in the matter of the granting of titles it is seen that it is merely a form, and that the real decision lies with the elected ministers—in Canada it has been decided to do without the form.

Very few titles were granted during the premiership of Sir Wilfrid Laurier, who, in a debate a short time before his death, declared that he would be willing to throw his title with the others in a heap in the market-place so that a bonfire might be made of them. It may seem strange for one who was himself the recipient of a title to speak thus, but it is well known that the late Liberal chieftain was really not in favor of titles in Canada, and had frequently stated that they were not in keeping with the democratic spirit which should prevail in Canada. It is told that the first intimation he received of his own knighthood was upon taking his place at a state banquet while in London attending the Queen's jubilee when he found his place-card inscribed: "Sir Wilfrid Laurier." He could not very well then have declined.

Knighthood may have been picturesque in feudal times; but, like everything else belonging to that age, it appears incongruous today.

Northwest Farmer Sits in on the Market

Minnesota Co-operatives Form State-Wide Selling Agencies

A FARMERS' market—such promises to be the new dispensation in Minnesota. At least, the farmer is going to become an increasingly important factor in it. Farmers in the North Star State, long among the most active in the development of local co-operative enterprises, now are going one step further and setting up their own selling agencies at the terminal markets. All the way to the terminal, is the new program.

Farmers all over the country are talking about improving our marketing system. The American Farm Bureau Federation, attacking the problem on a national scale, is seeking to work out a solution in a comprehensive way, and Congress itself is much concerned in the agitation that wages over the evils in the system of marketing farm products.

But without waiting for Congressional action or the establishment of national marketing systems, Minnesota farmers, beginning at the bottom, with the local shipping associations, have taken some commanding steps toward solving their marketing problems. For instance, consider these accomplishments of the last few months:

The legislature passed bills declaring the Minneapolis grain market and the South St. Paul live stock exchange open markets, thus permitting farmers' organizations to trade upon them on an equal footing with other dealers—the center of a constructive program of farm legislation.

Representatives of the Minnesota Central Live Stock Shipping Association, embracing approximately 30,000 shippers, have formed their own commission firm to sell their cattle and hogs at the South St. Paul market.

Plans are being worked out for another state-wide selling agency to market the products of the co-operative creameries, estimated at more than $75,000,000 a year, the first attempt of this kind in the dairy industry.

Of course, these are not the only lines through which the Minnesota farmer is seeking to follow his products to the terminal. Minnesota farmers, forming part of a great wheat-raising belt, are entering whole-heartedly upon the marketing program of the United Grain Growers, Inc. Indeed, co-operative elevators shipped 60 per cent of the wheat marketed from Minnesota farms last year, according to the state department of agriculture. So, it may be inferred, the program of the United Grain Growers may find recruits a-plenty in Minnesota. Developing a state-wide potato marketing exchange during the last year, farmers in that state now are preparing to enlarge this agency to handle other farm produce.

South St. Paul promises to become a farmers' market, with representatives of the local co-operative shipping associations federated into a state-wide marketing agency at this important terminal. Local co-operative organizations ship more than 75 per cent of the live stock sent south to St. Paul from Minnesota farms, by the way.

But these things are not so significant just now in a survey of the farmer marketing movement in Minnesota. The wheat-marketing plan of the United Grain Growers is national in scope, and the Potato Exchange, having demonstrated its success, has come to be accepted as a matter of course.

Of more moment, however, is the legislative program just enacted for the benefit of the farmers, and the quick steps taken by the farmers to form marketing agencies at the terminals to sell their live stock and dairy products. The significance of these steps may be seen when one stops for a moment and considers the extent to which the local co-operative enterprises have been developed in Minnesota.

For instance, take the case of the live stock shipping associations. According to W. A. McKerrow, live stock specialist at the University of Minnesota farm, and secretary of the Minnesota Central Live Stock Shipping Association, between 75 and 80 per cent of the live stock shipped to South St. Paul from Minnesota farms is shipped by local co-operative shipping associations. With all these associations federated into a central selling agency, a good many commission firms on the South St. Paul market are going to have slim picking this winter. Indeed, consternation among the commission men is real.

Now consider the creameries. Of 811 creameries in the state, 622 are co-operative creameries. Co-operative creameries make more than 60 per cent of the butter made in Minnesota, and Minnesota makes more butter than any other state in the Union. More than $80,000,000 a year runs the value of Minnesota butter, while the return from all dairy products reaches the commanding total of $166,000,000 a year, according to the most recent estimate of the state dairy and food department. So, it requires no great stretch of the imagination to see tremendous possibilities in a central marketing agency for the dairy industry of the state.

Likewise, it may safely be inferred that the farmer marketing program has had opposition in Minnesota. Members of the Minneapolis Chamber of Commerce and the South St. Paul Live Stock Exchange made a determined fight before the legislature to prevent enaction of the open market and open trading bills. The exchanges have taken the position that the co-operative organizations should be barred from membership because they prorate their earnings back to the shippers. The exchange calls this rebating, which it prohibits, and legitimately. But the farmers say this prorating is only a deferred settlement in full. In any event, the will of the farmers prevailed, and the South St. Paul stock market and the Minneapolis and Duluth grain markets were declared open.

The legislators further passed a law, designed to check gambling in futures on the grain market. They passed a law empowering local co-operative shipping associations to federate into a state-wide selling agency and charged the department of agriculture with the duty of assisting them. They provided for an audit of the books of co-operative organizations, extended the co-operative laws generally and introduced new features to facilitate the development of co-operative enterprise. A measure was passed to prevent members of the stock exchange from fining its members who trade with non-members, a bill designed to remove what the farmers claimed was a means of enforcing discrimination against their organizations. Altogether, it was a legislature awake to the new power of the farmers. What the farmers wanted, the legislature did. The farmer program had the right of way.

Of the readiness of the farmer to utilize the new avenues opened up to him by the legislature, the case of the live stock shippers is typical. The legislature had been adjourned only a few weeks when representatives of the Minnesota Central Live Stock Shipping Association met in St. Paul. The central association is composed of local shipping associations throughout the state. At that meeting the new farmers' live stock selling agency came into being.

"Four years ago, some of the shippers wanted to organize a central live stock selling agency," Mr. McKerrow said. "At that time, the local co-operative shipping associations in Minnesota were handling about 30 per cent of the live stock shipped from Minnesota farms. We decided that the time was not ripe, that we should wait until these local associations handled a substantial majority of the stock shipped.

"Now, between 75 and 80 per cent of the live stock going to South St. Paul from Minnesota farms is shipped by the local co-operative associations. The cattle buyer is a disappearing species in Minnesota, you see. So, when the legislature passed the open market bill and the open trading bill, we decided the time was ripe to form our own commission company. Of course, there are abuses, too, which prompt the farmers to launch this agency of their own.

"By the first of August, we expect to be shipping and selling cattle through our own commission firm at South St. Paul. In the first year, we expect to handle 15,000 cars of live stock. That is a conservative estimate. You see, there are 225 local co-operative shipping associations in the state associations. There are 25 associations in Wisconsin and perhaps 25 in South Dakota which will ship their cattle to the farmers' commission firm. But, supposing that but 200 locals send us their cattle, with an average of 75 cars a year, we will handle 15,000 cars.

"Now, let's see how this thing is going to work out. We propose to charge the usual commission of $15 a car. That will make our commission $225,000. Based on the experience of the marketing agency organized by the Farmers' Union at Omaha on a considerably smaller scale, we will return half of this commission to the farmers after paying all our expenses. In other words, the farmers will save $112,000 in commissions alone.

"But there will be a bigger saving to the farmer by getting more money for his stockers and feeders. That's going to go hard with the speculators, but it's inevitable. At present a commission man receives a car of cattle from some local co-operative shipping association, perhaps. Maybe there are a few head not good enough for the packer. They are weeded out as feeders or stockers. The commission man must take a small price because he has only a few. A speculator buys up these feeders, a few here and a few there. Presently, he has a carload, or several carloads. Then, he can sell them at a big advance. Thousands of dollars have been made by these speculators, and the farmer is the loser by the system. Now, the farmers' organization will sell all these feeders and stockers back to other farmers. Each day, we shall assemble them from the shipments.

"In five years, from 50 to 75 per cent of the live stock sold will be marketed through co-operative marketing agencies at the terminals."

The Minnesota Central Live Stock Shipping Association, formed to assist in the formation of local co-operative shipping associations and aid them in their work, incidentally is an illuminating instance of the value of organization. Promoted by the University farm, it has expanded in four years to include 225 local associations with approximately 30,000 members. It has obtained the passage of a law placing a branch of the state railroad and warehouse commission in supervision of the stock yards. This is the only stock market in the country having this provision for the protection of shippers. Appealing to the commission, the association got the price of hay reduced from $42 to $32 a ton, and corn from $2.75 to $2 a bushel at the yards, saving $60,000 in the first six months. In disputes over commissions, or when rates are raised, the association appeals to the commission in behalf of the shippers. For two years, Minnesota shippers paid switching charges of $1 a car, though the Federal Government allowed interstate shippers $2, all because the central association got on the job and presented the side of the shippers effectively before the state railroad and warehouse commission.

But with the farmers selling through their own commission firm, many of these difficulties will disappear.

Representatives of the co-operative creameries were not far behind the live stock shippers in launching plans for a central marketing agency. Called together by the state department of agriculture, representatives of fifty leading creameries early in April instructed a committee to draw up plans for a marketing agency to be submitted to a state-wide conference of all co-operative creamery men at an early date. Tentative plans made at the first meeting call for the establishment of a selling agency in St. Paul, and another branch in New York. Sale of the entire product of the co-operative creameries would be made through this agency. Plans are being formulated by the dairymen in Minnesota, Wisconsin and Iowa for the formation of a marketing organization that will cover these three great butter-producing states. However, time will be required to perfect this organization. Mr. McKerrow pointed out that anything approaching a national marketing organization in the dairy line may hardly be feasible, but declared that the development of an organization handling the products of these three states is a likely development in the near future.

The open market bill passed in Minnesota simply provides that any exchange or chamber of commerce shall admit to membership any person, firm, company or corporation which applies for such membership, provided the practices of such firm or company do not conflict with any reasonable rule of the market and provided it agrees to abide by the rules of the market. The co-operative associations are expressly designated as eligible to membership under this provision. Any rule that would tend to limit the distributions of profits by a marketing association is declared unreasonable. Any member who refuses to trade or deal with another member on an equal footing is declared operating in restraint of trade and guilty of a felony. For the benefit of the cattlemen, another bill was passed, declaring the refusal of a member of the exchange to deal with a non-member to be contrary to public policy. It was provided further that no penalty or fine shall attach to any member of the exchange for dealing with a non-member.

"We do not propose to crowd out existing agencies," said Commissioner N. J. Holmberg, of the state department of agriculture. "If the farmers' organizations are more economical, they will persist. If there are any abuses, nothing will correct them so rapidly as the entrance of the farmers upon the terminal markets. The value of these organizations in the terminals lies not so much in saving money, though that will be considerable, but the value will be most in keeping things in balance. A farmers' market is approaching realization."

But more than this, Minnesota farmers propose to have their own state-wide selling agencies for live stock, for their butter and eggs and other products. Instead of seeking to develop their own markets, they are taking over existing markets more and more. It looks as if the farmer is about to have his long-deferred inning in the Minnesota markets.

Harding's Fighting Dromios

By WM. ATHERTON DU PUY

(C) Harris & Ewing

JOHN W. WEEKS,
Secretary of War

(C) Harris & Ewing

EDWIN DENBY,
Secretary of the Navy

OVER in those twin departments of national defense, the Army and Navy, the President has placed two men who, following the slap-stick example of Ike and Mike, and the more classic formula of the brothers in Shakespeare's "Comedy of Errors," look alike.

Secretary John Wingate Weeks, at the War Department, is but a slightly divergent facsimile of Secretary Edwin Denby, of the Navy. Fortunately the Secretary of War wears a tag of identification. It takes the form of a hirsute covering for his upper lip, a conventional mustache. The stretches below the nose of Mr. Denby are shorn of all adornment. The difference rests, not in the endowments of nature, but in divergent habits in the use of the razor.

If Mr. Weeks should shave off his mustache he could, any morning, walk over to the Navy Department and open his conferee's mail. If that gentleman should take up his associate's amputated appendage and stick it on his lip, he could readily stop at the War Department and issue a new slacker list.

And the remarkable thing about the likeness between these two secretaries is that they are of a type that is quite out of the ordinary. Each is over six feet in height, for instance, and men of this stature are rare. Each weighs near 250 pounds which is a possession of avoirdupois quite out of the ordinary. Both have towering domes which present aspects that are unbroken by even a suggestion of hair. Both are full-faced, blue-eyed. Both are Americans of many generations standing and both are of English extraction.

Experiences Much the Same

THERE are even points of striking similarity in their experiences. Fifteen years ago both were members of the House of Representatives. It even happened that they worked on the same committees. This was notably true in the case of "the spanking committee," so-called because its purpose was to rebuke Theodore Roosevelt, then President. Mr. Roosevelt had asked Congress for additional appropriations for enlarging the Secret Service. Congress had refused to grant the request. The President had charged that this refusal was due to a fear on the part of Congress that the Secret Service would ascertain facts which that body wanted to keep dark. Congress appointed "the spanking committee" which ordered the remarks of the President expunged from the record. Weeks and Denby were on the committee, and both favored this action.

These secretaries have seen service in the Navy, are business men, and successful.

Then, of course, there are elements of dissimilarity in the two men and the lives they have led. I have gone to each and led each to talk of himself and the things through which, like Othello, he has passed. A man may be properly judged by his performances but, I hold, he reveals himself best in the manner in which he looks on that record. The story is more interesting as he tells it.

The Weeks family, the Secretary of War told me, settled in New Hampshire a hundred years before the Revolution. Down in the town of Greenland there is an old stone house in which dwells a man named J. W. Weeks. The house has been occupied by people of that name since the time it was built 230 years ago and used as a fort for protection against the Indians. Just after the Revolutionary War a Lieutenant Weeks, shaken loose from the soil as youngsters so often are by such conflicts, moved up into the meadows of Northern New Hampshire and settled. There his descendants have lived and died, sturdy farmers, until the present generation.

The Secretary of War would have done likewise, he believes, had his Congressman not volunteered the offer of an appointment to the Naval Academy. The Secretary makes the point that this place was not sought but came to him. The remarkable thing to me in his career, as he sets it forth, is the fact that he has sought none of the opportunities that have come to him but has gained success by handling with common-sense efficiency the tasks that have fallen into his lap.

At Annapolis he plugged along and graduated at about the middle of his class. He won his chief distinction as a wrestler, for he was a lad of great strength and powerful on the mat. He graduated in the class of 1881 and Congress legislated him out of the Navy. That fighting arm of the government was full up on ensigns. There had been over production. So the ten men standing highest were retained and the others were dismissed with a year's pay.

So the farmer boy from New Hampshire found the calling for which he had been trained gone. But here again, he says, it was some influence entirely outside of himself which determined his course. He met a man casually who was going down to Florida to survey rights of way for some proposed railroads. This man, learning that he was not to follow the Navy, offered young Weeks a job which he accepted.

He worked three or four years along the east coast of Florida, running lines through a region that was then a wilderness but in which now stand such resorts as Palm Beach and Miami. He went to breakfast one morning at Orlando in the cottage of a friend and there he met a young woman just returned from boarding school, a Miss Martha Sinclair, and she, now much mature, is pouring tea as a cabinet hostess in Washington.

The idea of becoming a banker had never occurred to this Yankee farm boy, Annapolis graduate, surveyor. Here again did opportunity come to him unsolicited.

Becomes Mayor of Newton

HE HAD come to know quite well a gentleman from Boston who spent his winters in Florida. That gentleman was familiar with the affairs of a certain small banking and brokerage business in Boston which was having difficulties. One of the partners had died and the other had gone blind. The son of one of them was the bookkeeper in the establishment and he wanted to carry on the business and would do so if he could find the right sort of man for partner. The gentleman who wintered in Florida said he knew just the man, a youngster named Weeks. So did the offer of a partnership come to the surveyor unsolicited and so did he get into the line that was to be his life work.

Weeks, of course, knew nothing of banking or brokerage but he had Yankee hard-headed common sense and he had a training which makes for efficiency and discipline. His firm immediately began to pick up. In a few years it was a great institution of Boston.

As a solid citizen he became mayor of his home town, Newton, went to Congress, finally to the Senate. All of these opportunities came to him unsolicited. So did his present post in the Cabinet. He is a calm, composed, placid man who would be entirely content on the model farm he has developed in New Hampshire.

When, as a youngster of 18, he says, he made his first public speech, he got no single tingle of excitement out of the occasion. In 1918, after having served one term in the Senate, he met the only defeat in his career. They got the news at Newton by 10 o'clock in the evening. Mr. Weeks went to bed and was asleep in five minutes.

Yet upon occasion he tells a good story. There is one, for instance, which emphasizes the wisdom of keeping one's own counsel and talking little. A farm Negro, he says, went to a circus and there saw a remarkably human orang-outang. He edged up to the animal and remarked sociably:

"Howdy, Frien'," but got no response.

"It's nice an' cool in here," volunteered Sam. Still there was no reply.

"You may be right," he finally ventured. "If you got to talkin' they would put you to hoein' corn."

* * *

The early career of Secretary Denby was more eventful, was almost romantic in fact. He was a boy of 15 when, in 1885, his father was appointed minister to China. The Orient had hardly felt the touch of the outside world in those days and was a far different place in which to live than it is today. The upper-class Chinaman had not yet reconciled himself to the appearance of western women on the streets, a thing which to him was indecent. And when he was asked to tolerate so unthinkable a thing as dancing! It was impossible. So the Europeans and Americans lived apart and had little to do with the Orientals.

When Denby was 17 he entered the Chinese customs service which was internationally administered, and for ten years he lived in a colony made up of men from all nations—an experience which could hardly help having a most broadening effect on his mentality. And in those years he ran about a good deal on vessels that plow the seas and came to know much of the ways of men afloat. Particularly did he cultivate men of our own Navy who visited Chinese waters for already his first love was that branch of the service and already was he a student of naval history.

Denby was 26 or so when he returned to the United States, to Detroit, and started in to get himself a real, American education. He had but graduated in law when along came the Spanish-American War. Following his natural desires he was already a member of the naval reserve and was ready for muster in. He saw service as a "gob" on the U. S. S. Yosemite. He chuckles when he tells of the time when Theodore Roosevelt, then Assistant Secretary of Navy, went to President McKinley and urged that the Naval Reserves be sent to sea.

"But they have never been to sea," said Mr. McKinley. "They will all get seasick."

"That is just what we want," responded Mr. Roosevelt. "When they do we can see what is in them."

After the Spanish-American War Mr. Denby returned to Detroit, served in the state legislature, came to Congress for three terms running from 1905 to 1911, went into the truck business in his own home town, at the same time practicing law.

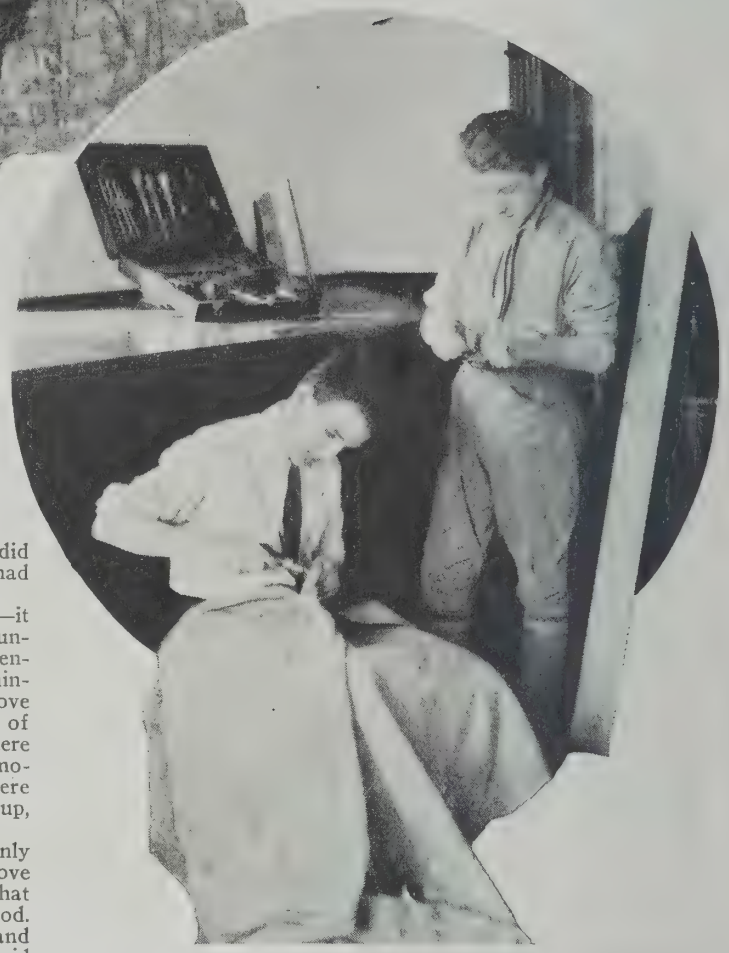
Denby Joins the Marines

WHEN the United States entered the European War, Denby enlisted as a private in the Marines despite the fact that he was 47 years old and weighed 254 pounds. He went down to the Marine training station at Paris Island, off the coast of South Carolina, and reported for duty. He says that he fully expected the government would provide war togs for him to wear so took only the clothes in which he stood. This was, however, early in the life of the station and the equipment was not very complete. They had clothes of the ordinary sizes but his dimensions were not those of the normal "leatherneck." There was nothing about the place that would cover him.

The drill sergeant did not seem to worry much about his predicament, Denby says, but admonished him to go ahead and do the best he could, that the situation would work itself out. So Denby put on the clothes and where they would not meet he tied strings from button to buttonhole. With 14 hours a day on the drill ground he began to notice that the edges of his garments were steadily approaching each other and before long the prophecy of the drill sergeant became true. The recruit had been reduced to fit the clothes.

Denby took all the gruelling training that was given to any other enlisted man. After going through the mill he became a drill sergeant and took other companies "around the loop." Finally he was advanced to lieutenant and it fell to him to administer the "Marine chat" to all the new organizations. The purpose of the Marine chat was to try the souls of the new men, to shame them out of the corps if they were not worthy, to exalt them if they were. In groups of a hundred he gathered them, talked to them of the honor of the service which must be upheld, the sacredness of the mission upon which they were going, the stress they might be called upon to bear, of the valley of death. His purpose was to consecrate or to break them. He says that those months when he talked to those boys were the greatest of his life.

So does this Secretary of the Navy bring to his office a very wide experience along those lines which should bear most directly on his task. He has been in the ranks as a sailor and a Marine and the Marines are under the Navy Department. He has sailed all the seas, is possessed of the world viewpoint. He has been in Congress and understands the necessity of co-operation between the legislative and executive branches of government. He is a human, oratorical sort of man with a great love for his fellows. He is hitting it off in Washington.



Growing Junior Jekylls

Let them begin this way. Out in the back-yard have a picnic, cook something, work out some youthful plans. This is the normal way for boys to develop.

The boy leader is giving the bunch a talk. He knows that he can say things to them out here on the shores of the lake or ocean that will be received and acted upon. They are in a receptive mood. Let them get their "kick" out of such pastimes.

These lads are making a tent for camping. They are doing something rather than hanging about the streets waiting for "something to happen."

A SIXTEEN-YEAR-OLD boy of a near neighbor is the proud possessor of an automobile, a gold monogrammed cigaret case, and numerous tailor-made suits whose pockets are lined with spending money supplied by an indulgent father.

Also, he has been arrested three times for disorderly conduct. But his father's money paid his fines and paternal influence stood between him and the juvenile court. The father remarked to the judge in extenuation of his son's conduct, "I have been too busy with my affairs to look after my boy."

There seems to be an epidemic of business interest outside of the home, judging by the records of the juvenile court.

During the last year there were 6,727 cases of juvenile delinquency, and 6,900 cases of improper guardianship in New York City, "improper guardianship" meaning lack of parental care. This made a total of 13,627 youths in one year in New York that were hailed before the juvenile courts. The fathers of the country are evidently all too busy stabilizing the industrial condition of the country to save their own homes from disaster.

"I never bother about training the youngsters. My wife attends to that," said a business friend to me recently. His attitude is a fair indication of the majority of the men who have spent years building up a successful monument in the business world, but have neglected to stabilize their own homes.

"Let George do it," has come to mean, "Let someone else do it," when it comes to teaching the boys and girls the first rudiments of responsibility to the community and to the country.

For the past few years our orators have orated about "the children of the nation," as something to look forward to, as something grand and sublime. All of which is true, *only* if the fathers and mothers of the nation do their full duty—at home. We have been rudely awakened the last year. It is no longer the millions of children who happen to be living in the various towns and villages and cities: it is our flesh and blood at stake.

We have talked about "the children" and considered them as something apart and let them run about without attention; now it shocks us to open our morning newspaper and read in the news how Johnny, who lived next door, was apprehended by the police because they had found him with the stolen loot from a hardware store that had been recently burglarized.

Then follow the details. We had always thought of John as a normal boy. We had seen him several times and had heard his father tell about what he was going to do for Johnny when he should come of age.

"We did it to get a kick out of it," was the explanation of three youngsters who had been caught red-handed as they had planned to rob a down-town store in a western city. Their plans had been as carefully laid as those of the most experienced criminal. And, what is more, their parents did not know what their children had been doing.

We read in the daily news—it has ceased to be featured as unusual any more—of a seventeen-year-old boy, the son of a minister, who with a companion drove in his father's car to the end of one of the city's car lines and there waited for the conductor and motorman and while they were changing the trolley held them up, taking everything they had.

With a recklessness that only boys of that age know they drove through a cordon of police that had surrounded the neighborhood.

"My gun was in my hand and it has a hair trigger," the boy said when he told his story to the police. He seemed to have little idea of the seriousness of his act.

But, you say, didn't their parents know of the waywardness of their sons? Their parents did not. These boys and others tell their folks that they are "going to the movies," or "going to the Y. M. C. A." or "going to visit my pal," and then they will meet outside to "pull off" something "just for the fun of it," and return in time to go to bed without attracting the suspicion of their own parents.

These incidents are in no sense exaggerated nor are they unusual. It is scarcely worth a place on the front pages of the newspapers to tell the exploits of boy criminals and their gangs. The thing has come to be common, almost the expected.

In another town, three high school boys, the eldest of them eighteen, all of well-to-do families and ordinarily good boys at home, were caught. They had been stealing automobiles. The records of the case show that the parents had accepted the boys' excuses when they were out at night. The father and mother had been busy with their own work and "supposed" that their children were growing up in the usual way. It is feared that they did grow up in the altogether too usual twentieth century fashion.

Under false excuses, accepted at face value by the fathers and mothers, these boys of good families would steal high-powered automobiles and burglarize homes and stores. Before they had been caught or even suspected they had handled fifty automobiles and their loot was worth several thousand dollars.

They were all normal looking lads, who had never in any way come in contact with the police or with the law. They had learned how to shoot quickly and accurately, and they were reckless enough to do it under the slightest provocation.

It is needless to multiply incidents. That is unnecessary. The ones here given have been chosen from scores. The youths involved were not abnormal mentally and all came from "good families."

Read your morning or evening newspaper. But you will have to read it carefully for such an item as that of the boys who stole automobiles for it was given scarcely a dozen lines in a city paper less than one hundred miles from the town where it occurred.

What is the outlook today for "the children of the nation" and for the nation itself, as boys such as these are soon to become the voting citizens of this land of the free and the home of the brave?

Are we training youthful Jekylls and Hydes? Are we sure that our own boys and girls, that are carefully groomed of a Sabbath, able to lift the hat to their mothers on the street and bred with the home graces of politeness and apparent courtesy, are not members of some gang that is traveling along the edge of lawlessness if not actually doing unlawful things?

It is true that some children are endowed with exceptional vigor and precocity and do not yield readily to the ordinary restraints of parental and school control. Their play spirit seems to have gone wild. They do it to "get a kick out of it."

They may be living in a world of baseless romance, bred by too constant attendance at worthless motion picture shows, and the reading of unhealthy fiction. They are anxious to know more of the world as they view it. With the passions of a man and the self-restraint of a boy, without any other home conditions to steady him, such a boy is ripe for any course of conduct which suggests itself, or surroundings that may influence him. He may begin by playing truant from school, he may at home or elsewhere become dissipated; then he becomes secretive with his parents and restless with his relatives.

It is here that the "gang" spirit plays a large part in his life. He blindly takes whatever the gang has to offer be it good or be it bad. He finds a pleasure in planning on doing something that has the element of danger connected with it, he likes to do the "things that the fellers do," which are not the things that fathers and mothers wish their children to be doing.

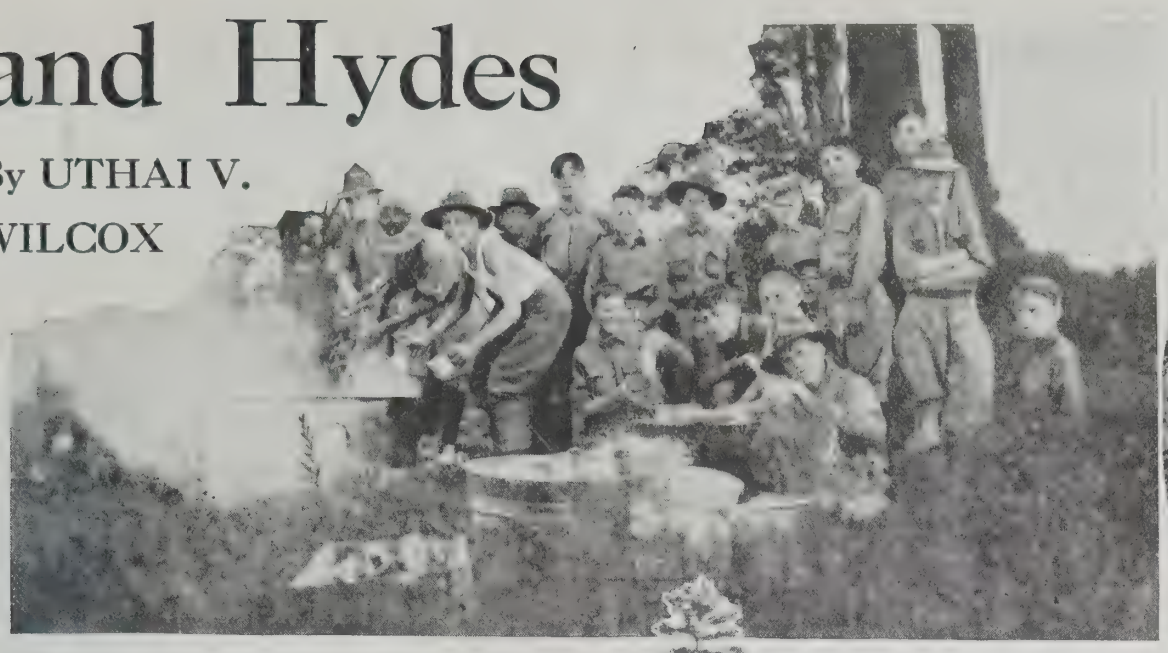
If the restraint at home is tightened at this period without a sympathetic understanding of the boy's nature, he is apt to become either sly or deceptive, or run away from home and follow his own desires elsewhere.

Figures procured from New York City say that some four hundred thousand American boys under sixteen run away from home every year, or at least break away from home control, and their arrest is caused by their parents. This, of course, does not include other thousands of boys and girls who break away from home and are not reported to the police authorities.

In New York City alone the records show that "ungovernable children" which means the children of the homes where the parents have ceased to be a factor in their government—has increased more than fifty per cent in the last four years.

Last May a particularly well-informed chief of police of a metropolitan city said that the state of affairs among high school pupils was beyond the possibilities of detailed description in print. And he was not a man who was excitable or an alarmist.

In another city remote from this one the police department had for three years been troubled by gangs of sixteen-year-old boys who lived in the best homes of the city and who by night would terrorize the town, sometimes taking young girls with them to their rendezvous.



What can we think? Is there a new virus that has infected the youth of the last generation? What of the church and the home, has it lost its grip on the young?

The chief reasons for these conditions can be summarized in four words: "Lack of home control." This means many things. It means, as indicated at the first of this article, that the father has to a large measure ceased to be a factor in the training of his own children.

With the competition keen in his business line, he says grandly, "You bring up the children, and I'll earn the money." He says this to his wife and to the public school, and to the church and to the Y. M. C. A. and often unconsciously to the "bunch" and the "gang."

and Hydes

By UTHAI V. WILCOX

These lads have gone out with a boy Y. M. C. A. leader for an overnight hike. Supper is ready and all hands are turning to it. They'll get a "kick" out of such an evening, that will "kick" them along the right road.

Give your boy something to do. Let him get so tired in proper exercise and some work to do that he will have no desire to run the streets at night to find a good time.

Boy Scouts out for an encampment. The discipline demanded with out-of-doors setting appeals to growing lads.

He provides everything needed to rear his children—but himself. He is too busy to look after his boy during the very ages when his authority, position and attitude are most needed, during the ages from twelve to twenty.

Children have become more sophisticated than formerly. They listen to father's remarks and do not obtain the respect of the law and of law-abiding citizens that they should have. He comments very freely about such sumptuary laws as income taxes, speeding, the smuggling of illicit drink and those statutes that curtail his liberty. He is more fagged out when he comes home and weakly protests, instead of rising to face conditions that would demand the skill of a Solomon.

The family circle is not what it used to be. Instead of gathering about the table to read and study in the evening it is now the movie show, the dance, class stunts and entertainments.

There has been much said for and against the motion picture. There is much that can be said on both sides. Right motion pictures are one thing, the thrilling, hair-raising, dare-devil plays and sex-problem shows are entirely another.

Mr. Roland C. Sheldon, who is general secretary of the Big Brother Movement in America, visited a reformatory recently and talked with the boys about the reasons for their being imprisoned.

He summarized the composite answer of the majority of lads:

One said, "It was the movies that got me in here."

Mr. Sheldon asked, "Do you mean that you stole to get money to go to the movies, or that you saw pictures that made you want to steal?"

"I saw pictures that made me think of stealing," answered the boy.

"But didn't the pictures show that the thief always gets caught and punished?"

"Oh, yes, but I thought I was wise and wouldn't get caught. I thought I wouldn't make the mistake he did to get caught."

The boy was not more than fifteen, just an ordinary boy, good natured and unemotional.

Another boy of seventeen, possibly eighteen, was asked what he thought ought to be done to keep other boys from following in his footsteps. He answered promptly as if he had given it some consideration, "Don't let them go to the movies so much." He would limit them to once a week.

The camera in its kaleidoscopic portrayal of human emotion and passions registers motives and suggests ideas that would never have entered the boy's mind. Seeking excitement he follows along to the climax, forgetful of the comparatively few short feet of film that shows the culprit sitting in the prison cell, for that part is unexciting.

Examinations show that some persons should by their very inherent nature be forever prevented from seeing thrilling motion pictures. It unstabilizes them.

It is no more possible to rear a healthy-minded boy and girl on a daily diet of motion pictures as now shown than it is to expect children to be strong and well when they eat nothing but horse-radish. If you feel that you must let them have some horse-radish—well, consider the majority of the films as shown in just that light.

Then there is the lack of a religious element in the training that cannot wholly be supplied by the Boy Scouts nor by mere hikes or physical care.

There must be less jazz and more prayers if Johnny and Algy are to be saved for this life or the life to come.

Finally there must be a stronger appreciation of the boy's nature during these "difficult and dangerous ages." The question being a serious one it must be studied as you would study a problem in business. The boy must not be considered an outlaw and his every movement watched and suspected. But in order to be sure that he is not acting out a Mr. Hyde nature away from home see that his energies are so fully taken up in useful and pleasant occupations that he has no time nor desire to "paint the town red."

There is a regular amount of work expected and demanded each day that will be interesting and worth while. There is opportunity for plenty of out-of-door play—baseball, tennis, hikes, tramping, swimming and all the things that boys like to do. Let the parents help them to do it, and whenever possible do it with them. It is here that the Boy Scout company and the Y. M. C. A. rightly conducted with leaders of ability who understand the boy's nature may help.

But it is a splendid thing for any boy to "hit the trail" for a day out in the woods, along stream or by the lake. The discipline of camp-life with its give and take and its duties is good citizenship and character training.

But every father should see to it that he becomes personally acquainted with the captain of the Boy Scout troup and with the secretary of the Y. M. C. A. The acquaintance will not only encourage the boy leader but it will open the eyes of the father.

Then let the family be home in the evening, or with friends that you KNOW. One of the great home-destroying practices of the American people is that of allowing children to run out upon the streets at night without restraint. It quickly produces an insatiable craving for excitement and induces dissatisfaction with the quiet of the household and a discontent with the commonplace things that may prove a life-long handicap.

Let the home furnish some entertainment that will enrich the life and give real and lasting enjoyment. Games and contests, class socials and story-telling will prove the best means of fostering in the boy a genuine fondness for the home.

Evil associations are the first steps toward evil habits and this too often begins with youthful smoking. "All scientists are agreed that the use of tobacco by growing children is injurious. Parents, teachers and physicians should strive to warn youths against its use," says Dr. Meylan, of Columbia University.

In a study recently made in a western state of twenty-five hundred school boys and college youths who were smokers, it was found that they ranked ten to twenty-five per cent below the average in their studies and in mental perception.

They were as a rule sufferers from chronic sore throat, sore eyes, weak lungs, heart palpitation, and were noticeably weak in moral stamina and self-reliance. They ranked 17½ per cent lower than the non-smokers.

Such are the remedies: Home life; regular work to do; outdoor exercise; stronger religious influence; elimination of exciting tendencies. It means more than a mere acceptance of these to lift the "children of the nation" to the higher planes that they should reach. The hope of America is in her youth. There is, therefore, no higher privilege of citizenship than in training the boy or the boys about the home, encouraging the community consideration of playgrounds, helping to foster movements that will open the way for normal, physical and spiritual development.

We are not true patriots unless we remember this. We are provincial in our regard for our own welfare. We trust to kind Providence and the police officers that everything will come out all right.

"Devoted to your boy? Nonsense! You're devoted to yourself!"

That is what one judge told a father who was trying to plead that he had indulged the lad because the boy was insistent, because he wanted this and that, and because he did "not have time enough to find out what his boy and the other boys were doing."

And that is coming to be the true diagnosis. In other words, it is a species of selfishness that keeps the father from spending time studying and helping in his boy's right development.

One family in California that had passed through some awakening experiences in regard to the trend of their home life and their children's future decided that it was time to do something.

The father called the members together and formed a partnership, with father and mother as the senior members of the firm, each child being apportioned some particular work which contributed directly or indirectly to the comfort of all the others. Here is the actual contract that was drawn up:

"We, the undersigned, love each other with all our hearts and want to do all we can to make our home the happiest place in the world. We will try always to be patient, kind and thoughtful and to do cheerfully and to the best of our ability whatever our part of the household work may be. We will try to close the doors after us in winter, and not to bang the screen doors in summer, to remember to use the doormat in muddy weather, to keep our things in order, to put the hammer back in place, and so on."

The younger members of the family were delighted with the form and ceremony, and liked the idea of drawing up a formal instrument. The older ones made suggestions which were voted upon, and lastly all affixed their signatures to it.

Once a week the contract was read aloud to all the members. However, no one was publicly accused of having failed to live up to the spirit of it, but it was tacitly understood on such occasions that acknowledgment and apology could be made for specific shortcomings during the week past, if they had affected the happiness of the entire family.

Another family appointed one of the children "captain of the day." The captain of the day was always helped first at the table, the next younger next, and so on. The captain took charge of the discipline during the day. The idea of his responsibility was so impressive that it was rarely necessary to interfere with the captain's orders.

With boys this partnership of sympathy may wisely extend to confidences regarding the family concerns and anxieties. "Watch the youth of fourteen," the Rev. Mr. Forbush says, "when his judgment is asked relative to some home arrangement; and if it is possible for you to agree with his suggestions, isn't it worth your tact and patience" as you notice the glow of ambition and pride written all over the boy when he realizes that he has actually formed a member of the advisory board.

Working along such lines that are fascinating and pregnant with interest, the community and nation will receive the trained talents and developed intelligence of every child. It will receive the child's good will whether the parent is educated or illiterate, well off or poor, because the children have taken an interest and have an understanding of the realities of life and grow up with an appreciation of their abilities to help.

The remedy is not difficult, but it needs a will to serve, and a willingness to face conditions.

Briefly Told

Ben B. Lindsey, juvenile judge, of Denver, recently paid a fine of $500 and costs for contempt of court. The contempt charges were the result of Judge Lindsey's refusal to tell what a sixteen-year-old boy had confided to him in a talk having to do with a murder in the boy's family. The boy was a charge of the juvenile court.

Despite the fact that peanuts have dropped from around fifteen cents a pound to four and one-half cents, the venders continue to get a dime for a thin sack of goobers.

The highest and lowest points of land in the United States are but ninety miles apart. Mount Whitney, the highest point, is 14,501 feet above the level of the sea and a depression in Death Valley lies two hundred and seventy-six feet below sea level. Both are in California.

Hot storage as opposed to cold storage for many things may be realized soon if the experiments of scientists connected with the University of West Virginia prove satisfactory. Great success has been attained in showing the practicability of hot storage for such articles as clothing, carpets, furs, cereals, dried fruit products and other materials unaffected by dry heat. Hot storage with uniform and constant temperature of 100 degrees Fahrenheit would prove more effective than cold storage in many cases.

To commemorate the termination of the war, the coinage of "peace" dollars of an appropriate design is proposed in a bill recently introduced in the House.

The latest development in commercial aviation is the transporting of fresh fruit by airplane. A Scottish peer recently demonstrated the possibility of the flying fruit express by delivering fresh strawberries picked in his Kent gardens to President Millerand's chef in Paris.

A French scientist, chief of the bureau of radiography for the Paris hospitals, has demonstrated that an X-ray apparatus can photograph subjects through a stone wall more than twenty-five feet distant from the source of the rays. He has obtained clear photographs of metallic objects, the rays filtering through marble plate more than an inch thick, twelve inches of oak, four inches of plaster and a sheet of lead an eighth of an inch thick.

A civil engineer, who has spent twenty-three years in Alaska, declared before the House Territories Committee that unless development of Alaska is stimulated soon, depopulation will reduce its inhabitants to Indians and Eskimos only.

President Harding designated the week of May 22 as forest protection week. Governors of the various states were asked to arrange educational and instructive exercises to place before the people the need for preventing waste by unnecessary forest fires.

A twenty-three-year-old aviatress recently broke the world's loop-the-loop record when starting at the height of 8,000 feet she performed 199 complete loops before she landed her plane. The entire flight consumed one hour and twenty minutes.

A tremendous avalanche, plainly discernible from Hood River, Oregon, recently rolled down the face of Mount Adams. It is believed to be one of the largest slides ever to occur on that mountain.

Two Bakersfield, California, high school boys recently sent out mysterious S. O. S. radio calls which resulted in the dispatching of two destroyers from Southern California in search of a vessel in distress. The maximum penalty for sending out false distress signals is a fine of $2,500 and five years' imprisonment.

Such a flood of gold from all the world has been pouring into New York in recent weeks that the Assay Office has not kept up with the incoming shipments even by working a twenty-four-hour shift. Shippers have been requested to divert import consignments to the Philadelphia mint. Most of it is coming from France, England, Holland, Sweden, Turkey, India, China and the South American countries.

Despite the fact that 28.9 per cent of the world's savings are in this country, only eight per cent of the total number of the world's savers are American. One of every five inhabitants of France has a savings account.

Immigrants at Ellis Island are now permitted to cultivate flower beds and fruit. Experts from the vineyards of Italy and Greeks from the land of olives are competing in decorating the detention island. The Red Cross provides fertilizer and oversees the work.

A Cabinet chair is to be fashioned and presented to President Harding from the wreck of the old American warship Revenge, sunk by the British in Lake Champlain, October 11, 1776. The skeleton of the old vessel lies on the shore of the lake at Ticonderoga, having been draggd out of the mud twelve years ago.

Compulsory voting is written into the Czecho-Slovakia constitution. Every man and woman who is eligible to vote must do so or go to jail. As a result the will of the people is faithfully recorded.

To show the practicability of using dogs to carry messages when an airplane is unable to land, a fox terrier recently made a descent of 1,500 feet in a parachute from an airplane. When he landed he worked himself free from his harness and ran to headquarters with a message suspended from his neck.

Our Vital Need: More Business in Government

By A. R. PINCI

ORGANIZED inefficiency is what exists at Washington under the name of government. The government's inability in managing itself in a businesslike way is nothing new, and just now, because of President Harding's interest in the matter, is very much before public attention. But unscientific management of and by the administration is not, be it understood, an exclusively American characteristic. Other governments are alien to the science of management. The only difference between this country and other countries is that the American people can, if they insist, improve the situation which disgusts them, especially when taxes fall due, after which they forget all about it.

Waste, extravagance, overstaffing and duplication are the four principal governmental weeds in that perennial crop that Uncle Sam so carelessly cultivates year after year. From the day when the late Senator Aldrich declared that the government could save $300,000,000 a year to the recent day when Senator Ashurst raised the total—probably to keep up the ratio with increased costs—to $2,000,000 a day, exactly ten years have intervened, but the only ones who have profited by these warnings have been the campaigners, some of whom have been animated by the best of intentions and not a few by the desire for a subject suitable for the stump. It is so uncompromising and glib that the middle class does not realize that it is synonymous with *mañana*.

The problem is not new; it has no party. It is unnecessary to trace back its origin and constant variations. Suffice it to say that it exists. Its complexities, unfortunately, have been magnified by the lens of politics in a patronage shutter. It has led to the creation of miscellaneous commissions, boards and agencies that have been little more than ornamental. Discussion has yielded at times some good plans which, unfortunately, clashed with the intent of other parties at interest. As a result the feeble attempts at betterment have proved abortive. Attention has been given to auxiliary instead of primary questions. Every plan has involved the cardinal unwritten necessity to protect the personnel. In fact, every attempted solution has been based upon personnel instead of organization. The futility of this course can better be understood when it is realized that a problem involving the distribution and allocation of a hundred and odd bureaus is considered instead a problem of the government clerk, as the Federal employe has come to be known.

Both major political parties sermonized in accordance with strict campaign etiquette last year. The writer was assured of vigorous action on the part of both candidates and publicly quoted them accordingly. Both having been members of Congress they regarded the question with legislative equanimity. But this equanimity is an imaginative state, easily overcome by the "know how-ers."

President Harding, himself an advocate of system in reason, wants to reorganize the government departments on an efficient basis. If his chosen assistants do not interpose any obstacles, which would be superhuman on their part, he can bring it about in no time.

President Harding, like other Presidents before him facing the same problem, lost control of the situation by following the ancient custom of relying upon his executive assistants to get together and bring about the official millennium.

This is no actual cause for complaint. Regardless of just who it has been until now—and who it will be from now on—to obstruct the good work, and that everybody has been willin', it never happens that everybody would be in accord at one time on any one plan. It is to be expected that no man, be he the discoverer of efficiency even, is going to amputate his own department in favor of another.

Take the complex situation created by the need for a better understanding of our foreign trade problems. It was under President Taft that international commerce definitely assumed official importance. The Department of Commerce and Labor was established during Roosevelt's first term, and it remained a Siamese-twin sort of department until President Wilson's administration performed some excellent surgery. Meanwhile the department, little more than a statistical organization, did not concern itself with such imaginary questions as foreign trade. Foreign trade was not fashionable, not even to talk about. Secretary Knox invited much criticism by making the first plunge, and this was accompanied by the appointment of foreign trade advisors in the Department of State, of which he was chief.

Today there are or there is a trade advisor, and there are similar officials with other titles under the Department of Commerce. Both departments have, during the last eight years, engaged in a more or less silent war. Though to all intents and purposes the Wilson administration turned its back upon the dollar diplomacy of its predecessor, and apparently did so by relieving the State Department of its responsibility over foreign trade matters, the Department of Commerce began to experiment in this field, and the World War and the attending excitement made these experiments grow.

With the end of the war, however, Secretary Lansing, realizing that if the background of economics were eliminated foreign relations would not warrant the retention of the State Department, contended with his colleague of the Department of Commerce authority over the commercial attachés and the supervision of their work. Secretary Alexander refused to yield, and the matter was not stirred during the interim of 1920.

This problem, however, was inherited by the Harding administration. The business men concerned with this particular phase of governmental activities, as well as the few correspondents at Washington familiar with the genesis of this mix-up, ignored entirely the suggestion that this or that man could or would solve the difficulty. To say that it has been eliminated or that it will is to be optimistic—too much so. Neither Secretary Hughes nor Secretary Hoover, nor other secretaries or chairmen of executive and administrative commissions and boards having some jurisdiction over international economic needs, could by themselves, despite the best of intentions, correct the situation.

In fact, it may be taken for granted that an ideal, or nearly ideal Federal office reorganization will never be accomplished except by a President-elect before making his nominations, said nominations subject to his own theory of reallocation. President Harding could have worked out on paper—and as Senator the data was at his disposal—a chart involving the new plan, subject, of course, to modification and trial.

It is not just to say that Congress obstructs. Congress as a body will not obstruct if a President knows what he wants. Congressmen may impede for a while, but never in any policy which has the weight of public opinion behind it, as has Federal reorganization. Never passes a day that some member does not arraign or ridicule this or that bureau, and at appropriation time he makes his word good by voting to legislate out, yet in the course of interminable hearings before committees an unimportant officer of the doomed bureau is called to testify. Upon this testimony really depends his job, and eloquence at such times rises to zenith. Many a committee member unable to declaim as well on the floor, has envied the forensic brilliance of a witness thinking of his job, and his job alone. Think of the Congressmen at campaign time!

The reason that these bureaus succeed in perpetuating themselves is traceable to the President's attitude. I am speaking of the office, and of course of four or five administrations whose operations have come to my personal attention.

The President's indifference may be a loophole; again, it may be the secretary in charge who, scenting an emergency and fearful because of the threatened dismemberment of his composite organization, writes a letter or appears in person. Congress, because of the force of patronage, eventually yields.

If the President having decided upon effectuating a reorganization, were to submit to Congress a definite plan, the request would not be denied, because so far as the country is concerned, the advantages would all be on the President's side, with Congress or lesser officials on the defensive.

A precedent existed—a war precedent, it is true—in the Overman bill, by which President Wilson was given absolute authority to reorganize the government departments, commissions, bureaus, boards, in any way he pleased. But nothing came of it, though enduring fame would have been his in this case no less than for his other ideals. Instead, numerous war organizations, most of which have since become "reconstruction" offices, were added to an already topheavy, heterogeneous organization with resultant confusion.

It would be too much perhaps to expect the President himself to devise final plans for a reorganization, yet unless he alone decides to formulate them and rush them through, he will never succeed in squaring a party and platform promise with fulfillment. This is a cynical observation born of long experience at Washington, where, for instance, to trace a given bit of news it is necessary to visit several offices which ought to be one office, because their work is practically triplicated or worse. The trained correspondent becomes inured to these girovagations, but not so the business man. Thus we may explain the impossibility of team work between the business world and the government.

Briefly, while every official is sympathetic toward reorganization, his willingness is that the experiment be tried first on the other fellow. As long as the proposal carries with it the implication of diminished authority, executive officials are bound "to view with alarm."

Yet reapportionment by itself would not eliminate difficulties. It goes deeper than that. It is necessary to make many important changes in consonance with modern exigencies. The nation has grown so rapidly that the government has not kept pace with it.

This country has never emerged from its related railroad and shipping problem. Today it is more serious than ever. The railroads and our deteriorating merchant marine, which together constitute about $25,000,000,000 of property investment of vital nature, to say nothing of a million or so stockholders, have no representation in the President's cabinet. They form a constant emergency, but neither of which ever is brought to the President's attention except indirectly. Whenever railroads and merchant marine are discussed at a Cabinet meeting it is without the participation of railroad or shipping experts, but through disinterested secretaries as spokesmen. Thus our most costly property investments are separately permitted to drift along under the jurisdiction of independent commissions (frequently without experts because these are often barred by the organic acts of Congress) that, so far as records show to date, have never satisfactorily overcome difficulties. In between is sandwiched an occasional Congressional investigation, that as soon as completed is overtaken by new troubles.

This, of course, does not mean that a single departmental head could manage transportation affairs better than scattered commissions, but under the present system there follows a hodge-podge of legislative, executive and judicial duties that never dovetail and serve to keep our transportation properties in turmoil.

It is evident, therefore, that as much of our national wealth—the very nucleus of that greater wealth represented by other departments—is entitled to the benefit of the President's attention at the Cabinet meetings by

(Concluded on page 10)

Reorganization Proposed to Improve the Business of Government

This chart gives an idea of the changes proposed for the departments in our national government. It does not name, however, bureaus not subject to transfer, and all names that are in parentheses are those of the departments now holding jurisdiction.

STATE	TREASURY	ARMY	NAVY
Insular Affairs (War)	War Credits Board (War)	Soldiers' Home (Ind.)	Coast Guard (Tre.)
International Joint Commission (Ind.)	Federal Reserve Board (Ind.)		
Boundary Commission, Canada (Ind.)	War Finance Corporation (Ind.)		
Boundary Commission, Mexico (Ind.)	Farm Loan Board (Ind.)		
INTERIOR	**JUSTICE**	**AGRICULTURE**	**COMMERCE**
Federal Power Com. (Ind.)	Com'r. Prohibition (Treas.)	Bureau Fisheries (Comm.)	War Trade Board (State)
Forest Service (Agr.)	Secret Service (Treas.)		Tariff Commission (Ind.)
Naval Observatory (Navy)	Alien Prop. Cust. (Ind.)		Patent Office (Inter.)
Weather Bureau (Agr.)	Bureau Naturalization (Lab.)		Federal Trade Com. (Ind.)
Coast Geodetic Survey (Com.)			Bureau Markets (Agr.)
Public Bldgs. Grnds. (War)			xBureau Chemistry (Agr.)
Comm. Fine Arts (Ind.)			
LABOR	**POST OFFICE**	**TRANSPORTATION**	**PUBLIC WELFARE**
*Civil Service Comm. (Ind.)		U. S. Shipping Board (Ind.)	Bureau Public Health (Treas.)
*U. S. Employes Compstn. Comm. (Ind.)		Int. Commerce Com. (Ind.)	zPension Bureau (Int.)
*Bureau Efficiency (Ind.)		Engr. Bd. Rivers & Harbors (War)	zWar Risk Ins. (Treas.)
vMediation & Conciliation Bd. (Ind.)		Inland & Coastwise Wtrways Serv. (War)	Bureau Education (Int.)
		Bureau Public Roads (Agr.)	Census (Commerce)
		Bureau Navigation (Comm.)	Children's Bureau (Labor)
		Hydrographic Office (Navy)	Women's Bureau (Labor)
		Lighthouse Bureau (Comm.)	American Red Cross (Ind.)
		Steamboat Inspection (Comm.)	Miscellaneous Hospitals

*Should be one bureau.
vTo absorb identical bureau in Department of Labor.
zShould be combined into Bureau of Pensions.
xShould be combined with Bureau of Standards.

The foregoing is necessarily sketchy, and does not go into all the fine points and distinctions of the offices suggested for transfer, but their possibilities have been taken into account, and no challenge of dissent made tenable. If a further division is warranted it is not such as to involve difficulties.

The new departments are indispensable, because if the activities reasonably theirs should be distributed among existing departments more chaos would ensue.

REV. DR. CHARLES W. GORDON

Preacher-Writer-Fighter Now Industrial Arbiter

Ralph Connor as Chairman of Manitoba Council Outlines the Principles for Peaceful Relations

The service of the community is the supreme objective in industry.

The human element is the supreme consideration in industrial activity.

The highest interests of all concerned in industry are secured only by co-operation of all.

Differences of opinion are inevitable. The only sane method of settlement is by consideration *not by the club.*

THESE are quotations and it might be deduced that they are from a sermon on industrial relations, a fruitful and vital topic in these days. The sermon idea is not so bad a guess because they come from a preacher who is also a war padre with a record. You might not know him as Rev. Dr. Charles W. Gordon of St. Stephen's Presbyterian Church, Winnipeg, nor as Major C. W. Gordon of the 79th Cameron Highlanders of Canada, but if you know anything about popular authors and writers of "best sellers" you would recognize him instantly by his pen name, Ralph Connor, author of "The Sky Pilot," "The Man from Glengarry," "The Foreigner" and many other equally well-known books that are read and treasured wherever the English language is spoken.

This is not a story about preacher, war padre or author who is about to gain further renown when screen versions of some of his books appear shortly. It is about Charles W. Gordon, chairman of the Manitoba Joint Council of Industry, and about this body which has been working quietly in Winnipeg for the past year. The story is worth the telling, not alone because the Council of Industry is believed to be the only organization of its kind in the world but because there are many close students of industrial affairs who have followed its work and believe that it is blazing a trail which will yet lead to the solution of one of the greatest problems of the world today.

How Council of Industry Works

THE Manitoba Joint Council of Industry operates under The Industrial Conditions Act, which was passed by the Manitoba legislature in February, 1919. At that time were to be heard the first mutterings of the industrial troubles which culminated in the disastrous general sympathetic strike which paralyzed industry and upset all normal conditions in the city of Winnipeg and even throughout the whole province for six weeks from May 15 to the end of June. Impending trouble was in the air and the government was making every effort to find a way of avoiding a clash. Premier Norris had for months been giving his closest attention to the problem and had sought the advice of leaders among both employers and employes.

The Industrial Conditions Act of 1919 was drafted and submitted to the legislature after many conferences with representatives of the two parties directly involved and after exhaustive inquiry into attempts made in other parts of the world to find a remedy for existing conditions. The co-operation of both labor and employers was required, and after the bill had passed the legislature the government at that time was unable to secure the co-operation of the representatives of labor, who apparently mistrusted the professed objects of the act. Throughout the strike and for months afterward the whole situation was under constant study by the government with the result that at the 1920 session of the legislature the original act was amended to bring it more nearly within the views of the accepted representatives of labor. The amending bill passed without serious opposition in the legislature although it had a long and careful passage through committee. Incidentally, it may be mentioned, the provisions of the act were the subject of numerous discussions at meetings of an informal committee which sat while the legislature was in session and which was composed of representatives of labor and employes as well as some members of the legislature. The round table conferences of this committee, at which there was the frankest discussion of all the questions at issue, undoubtedly contributed largely to the understanding which was embodied in the amendments of 1920.

The Joint Council of Industry is composed of five persons, two representatives of employers and two of employes with a chairman appointed by the government, and who is, therefore, through the government responsible to the people. As previously mentioned, this chairman is Rev. C. W. Gordon. It is to be noted that through this chairman the general public is in control in cases of a deadlock between the representatives of employers and employes.

The council has all the powers of a judge of the Court of King's Bench in conducting inquiries. It may, whenever it has reason to believe that an industrial dispute exists, or seems likely to arise, hold a complete investigation and make public its report thereon. It was believed that in many cases this investigation would prevent a strike and in all cases as the result of the publicity given through the report of the council, the public would have an intelligent knowledge of the matters in dispute. During the past year this belief has been fully justified.

The council is empowered to make continuous investigation and report as to the cost of living from time to time for the purpose of enabling the public to judge whether demands for increases in wages are justifiable or not. In this connection the council has power to investigate the cost of any special commodity or service and to make public its report. It is also empowered to investigate and report as to unemployment and to estimate the number of persons likely to be or who are actually out of employment so that with such authentic information steps can be taken to provide employment or prevent unemployment.

Scope of Council's Work

THE council is given power to investigate and report as to housing conditions and also as to what extent prevailing rates of wages enable employes to make provisions for the future and their dependents. Another section gives the council the power to investigate as to unfair profits made by any employer or groups of employers through payment of unfair wages, this being a safeguard against sweatshop conditions and industrial "Bourbonism."

Section 10 gives the council power to take up the case of any employe who has been oppressively or unfairly treated and to assist him financially to obtain justice through the courts and by section 11 the council is given the power to lay a formal complaint against persons guilty of violation of any law which affects employers and employes or the public and to procure conviction.

The council is also given the power to recommend to the legislature of the province measures designed to improve conditions of employment and to safeguard against unemployment. Possibly the most important point in the amendments of 1920 was that by which the right of employers and employes to organize and to bargain with one another through their organizations, or the representatives thereof, or individually, is recognized by law. This embodies the much-discussed principle of collective bargaining.

The Joint Council of Industry was organized and ready for business on May 12, 1920, and up to the end of the year had held seventy-seven regular meetings and had ninety interviews with parties interested in cases dealt with. Twenty cases were heard in which a settlement acceptable to both sides was effected in eighteen, one case was still in process of negotiation at the end of the year while in the twentieth case the council's suggestions were declined. Acute strife such as strike or lockout was prevented in every case and, as will be noted later on, one case adjusted by the council contained all the seeds of real trouble in the building trades for the reason that between five and six hundred workers were actually concerned in the dispute and the whole membership of the unions in the building trades in Winnipeg might have been involved.

General Principles Worked Out

IN REVIEWING the work of the year Dr. Gordon places quite as much value on the general principles asserted and established by the council as upon the actual results of the specific cases brought before it. These general principles will be found to cover practically the whole field of relations between employer and employe and might well be studied by all persons who should realize the futility and stupidity of methods that in past years have brought no lasting improvement. The principles outlined by Dr. Gordon are as follows:—

General Principles Asserted and Established.

1. The Service of the Community is the supreme objective in Industry.
2. The human element is the supreme consideration in Industrial activity.
3. The highest interests of all concerned in Industry are secured only by co-operation of all.
4. Differences of opinion are inevitable. The only sane method of settlement is by consideration, not by the club.
5. Agreements once accepted must be preserved during their lifetime.
6. The spirit of an Agreement must over-ride the letter, if conflict between spirit and letter should appear.
7. Little troubles removed make for peace.

Dr. Gordon has also outlined the principle which should govern the rights of workmen and of employes as follows:—

Rights of Workman.

1. Trade Union activities which do not interfere with duty may not be penalized.
2. A living wage is every worker's right—a wage which enables the worker to live in decency and comfort.
3. Every worker has the right of appeal against any decision of his employer.
4. All workers permanently employed should receive a reasonable amount of holiday time.
5. The rate of wages involves such factors as

Cost of Living	Period of Activity
Permanency	Skill required
Hazard	Training required
Strain	Brain Power involved

Rights of Employers.

1. Continuity of work must be preserved.
2. A full day's work must be given in a full day's time.
3. Discipline must be preserved for the purpose of co-ordinate and continuous effort.
4. Insubordination involves prompt penalty.
5. Management must be untrammelled—a single hand must be on the wheel of control.

Some of the cases dealt with by the Joint Council of Industry during the year are of particular interest as indicating how a third party can study and measure the two sides to a dispute and find middle ground upon which the parties can agree. One particularly interesting case was that in which an individual worker claimed unfair discrimination and unjust dismissal. The employer claimed insubordination necessitating dismissal and the evidence given before the council indicated that the claim of the management was well founded. The point in this case is that, when it was put to him in the right light by the council, the justice of his dismissal was accepted by the workman and his former employer immediately offered aid in securing another position.

Disputes Between Labor Bodies Up

ANOTHER interesting class of cases which came before the council was that of disputes between labor organizations or between a union as an organization and individual members of that union. For example, trouble arose last summer between the Plasterers' International Association and the Bricklayers and Masons' International Union over work being done on a big new theater in Winnipeg. There was a difference of opinion here as to whether the plasterers or bricklayers and masons had the right to a certain class of work and when the contractors assigned the work to the bricklayers and masons the plasterers immediately went on strike. When the case was brought before the Joint Council of Industry the council was able to get the parties of the dispute to agree to a 50/50 division with the result that the work was finished without interruption. Meantime, the principle at issue was referred to the recognized International Union authorities for adjudication. The important point in this case was that work on a building, where early completion was of the most vital importance to the owners, was kept going with only a very slight interruption.

Another of the cases referred to had to do with disciplinary trouble between a union and members of the union. The investigation of the council showed that these members had been guilty of breach of rules of the organization and had therefore rendered themselves subject to discipline. In this case the good offices of the council secured mitigation of the sentence without interfering with the lawful authority to the union over its members. The interesting point in this case is that a labor union manifested such confidence in the council as to submit a case involving its internal affairs to the judgment of the council and that the union accepted the suggestion of the council. This has an important bearing upon the claim sometimes put forth as to the tyranny of such organizations over their members.

The experience of the council has indicated that friction frequently arises between employers and employes owing to the difference of opinion as to the interpretation of a clause in an agreement, the result being that from a very minor disagreement serious industrial disturbances may follow. One of the cases dealt with by the council during the year affords a good illustration. Here, owing to a difference of opinion as to an interpretation of an agreement between the Canadian National Railway Transfer Company and its employes, an incipient strike was produced but was called off on the understanding that the matter should be referred to the Joint Council of Industry. The council was happily successful, not only in settling the question of interpretation, but was able, first, to rewrite the clause so as to remove possibilities of future misunderstanding, and second, to remove various other causes of friction and to restore harmonious relations between management and workers. Incidentally, the council

Disarmament in Sight

THE unanimous vote of the Senate adopting the Borah amendment to the Naval Supply Bill, requesting the President to call a three-power conference to discuss reductions in naval armaments and expenditures, must be regarded as a splendid triumph for awakened public opinion. This record vote followed hard on the heels of the rejection of a similar amendment in the House at the behest of the administration.

There can be no question that a rejection that implied an alignment of the United States with the forces of militarism here and abroad startled thinking people into unwonted action. On all sides indignant protest was voiced. Church assembly after church assembly went on record in demands for a prompt initiative by the President looking toward bringing about world disarmament. At a convention of the Church Peace Union (an interdenominational body), in Chicago, Dr. Harry Emerson Fosdick, who had an important share in our Y. M. C. A. war work in England and France, went so far as to declare that the vote of the House made the United States at that time, in his opinion, "the greatest single menace to the peace of the world."

The press of the country, regardless of party or section, experienced a change of heart, and voiced the imperative sentiment of the country in favor of disarmament. Chambers of commerce and other business organizations made it very clear that further delays and vagueness in regard to a policy that contemplated the indefinite continuance of tax burdens with consequent sabotaging of the country's industries would not be tolerated. There can be little doubt that members of Congress in both Houses and the President himself were bombarded with such numerous and emphatic expressions of disappointment and dissatisfaction as left no doubt in the minds of the politicians as to the real nature of popular feeling and determination on the subject.

As a result, we have witnessed a volte-face in the administration's policy that is as hopeful as it is enlightening. Disarmament is no longer to be treated with mild tolerance as an academic or "sentimental" question. Washington has been served with unmistakable notice that the people are not to be played with. It is inconceivable that President Harding can now so greatly mistake the temper of the nation as to make the discretion as to time reposed in him a pretext for undue delay. Both Britain and Japan have already evinced readiness, even eagerness, to follow the lead of the United States in naval reductions. The President's opportunity is a magnificent one. It is nothing less than the fulfillment in our day of the counsel of Washington's farewell injunction to "give to mankind the magnanimous and too novel example of a people always guided by an exalted sense of justice and benevolence." And his responsibility is as grave as his opportunity is splendid.

"Benefits Derived"

PEOPLE all over this country are thinking about taxation. What is more to the point, they are thinking in terms of the collectivity rather than in those of selfish individual interests. This is well, for taxation is more than ever a vital problem at this time, when both the Federal Government and state and local units are making demands for expenditures on an unprecedented scale.

Each day's mail brings many letters from our readers on this subject. One from Mr. J. H. McEldowney, of Los Angeles, is helpfully analytical. Commenting on a recent suggestion in these columns that contributions to the expense of government should be in proportion to the benefits derived by any particular citizen or corporation, he points out that this notion—considered a taxation maxim by economists generally—is simply a substitute for an earlier maxim now regarded as fallacious and equally inherited from the days when tax collectors were very much on a par with bandits, as in Bible days "publicans" (tax collectors) and sinners were bunched—the maxim, that is to say, that taxes, tariffs and railroad rates should be based on "all the traffic will bear."

Our correspondent points out that one man's "benefits," in the way of government protection, aid and advantage, are pretty much the same as another's, regardless of the widest differences in income. Thus it would be impossible for the average man of small means to contribute directly toward the cost of the benefits he enjoys as much as does his wealthier neighbor enjoying no greater benefits. He reduces the case to a simple syllogism: If the benefits I derive from government expenditure are as great as those derived by any other person, it is only just that I should be compelled to pay as large a share of the cost of government as any other; but injustice is worked if the taxation of my income to aid in paying for government protection brings in only a trivial amount compared with that exacted from my wealthier neighbor, who receives no greater benefits.

Accordingly, it is suggested that even a rough approximation of the comparative values of "benefits enjoyed" is impossible, and that we might well substitute for that idea the assessing of every tax as a reasonable charge on the value of individual or corporate control of natural resources—the only property of all the people, if we except a few public buildings, bridges, ships and canals. Such control of natural resources, it is insisted, affords a much saner and more just measure of benefits derived from government protection than does income derived from wages, salaries, interest, profits, dividends or rents.

By "natural resources" our correspondent probably has in mind coal, petroleum, iron, copper, gold and silver, timber, water and water power. He would probably include as a proper basis for just taxation such natural monopolies as public utilities dependent on public franchises, such as railways, telegraphs and telephones, gas and electric light services and street cars.

There was probably some instinctive sense of the justice of such a tax in the early custom under which "the king's tenth" of all the gold and silver taken from the mines of Mexico and Peru went to the Spanish state—a provision that finds some place to this day not only in the mining codes of our Spanish-American neighbors but also in those of our own southwestern states. What gold and silver were in the days of the *conquistadores,* as important forms of national wealth, coal and oil are in our more modern day. So Mr. McEldowney's suggestion is not without historic example and its logic is evident. Such a tax might not solve the problem wholly but it would be a step in the right direction.

The Telltale Lines

"HE IS the kind of man who does his drinking in secret and his reeling in public—but he doesn't fool anyone but himself," commented the man who had been questioned concerning a certain character. But the man went reeling on, entirely oblivious of the fact that he had revealed his actions and habits quite as plainly as if he had advertised his intentions and then brought his bottle into the public square.

He fooled nobody but himself!

Those who saw him when he did not reel, could read his face. The lines of the face show as much as the lines of the hands—and they are plainly read by all.

You can behave according to one code of ethics during the week, and then profess faith in another code on Sunday, persuading yourself that you are fooling people. The chances are that you succeed in misleading someone—but that one is yourself and none other.

The butcher who short-weights, the grocer who short-changes his customers, the merchant who misrepresents his goods, the lawyer who double-crosses his clients, the farm hand who shirks his chores, and the man in the factory who tries to mislead his foreman, are all in the same class. But every thief robs himself most of all. The scars of dishonest dealing are bound to cut deep on their characters and reflect truly in their faces.

With persistent misbehavior and long-practiced cheating, the conscience may be hardened so that it refuses to function—but the fox-like expression of cupidity and cunning will mirror debasement in the lines of the face, disclosing the thoughts in the heart of the persistent malefactor.

What a silly, pitiful creature is the self-deceived man who thinks he can continue in the wrong way and conceal all trace of his hypocrisy from the world! He fools no one but himself.

Gun Turrets Into Farm Tractors

SLOWLY but surely, Isaiah's prophecy as to the coming time "when there shall be no more war" is finding fulfillment. Essen, home of Krupp guns, is busy making steel rails and mining machinery. There was much perturbation recently in England over a report that the two big ships shortly to be laid down—if continued armament competition is compelled by American naval policy—had been allotted to private firms so as to enable them to keep their armament plants going. The Admiralty promptly denied the report and investigation discloses that the Vickers and the Armstrongs, Britain's leading armament makers, are now devoting their plants to turning out sewing machines, mowers and reapers and other useful machinery.

Certain English papers deplore the fact that what are termed the "naval construction reserves" no longer received substantial assistance in their maintenance from orders from the Admiralty or even from such profitable erstwhile customers as Japan, Brazil, Argentina, China, Russia and Turkey. Three-fifths of the British Grand Fleet was built by private firms and all the guns, turrets, armor, engines and boilers came from that source.

It will prove a happy thing for the world if the element of private profit is wholly eliminated from the making of armament and munitions of war, in accordance with the provisions of the League of Nations Covenant. Enormous fortunes have been coined out of the wretchedness and misery of the peoples by these armament firms; but their day is passing. They may not make such big and easy money out of fashioning farm tractors and harvesters, spinning jennies, weaving frames and sewing machines; but people generally will be happier and more prosperous, and even the armorers will in time come to feel that there is a compensation in freedom from blood-guilt of the money made out of beating spears into pruning hooks, and swords into plowshares. Speed the day!

Mental Workers

WHEN Bernard Shaw was told the other day that there were 350,000 mental workers organized into unions in England, he expressed much surprise. He did not know, he said, that there was so much brain in the country.

Seriously, it is an interesting sign of the times that the "unionization" of the white collar brigade is proceeding apace in Britain just now. Time was, and that not so very long ago, when "Labor" disdainfully refused to recognize as a "worker" any man who did not toil with his hands for wages. The great army of clerks and accountants, stenographers and typists, to say nothing of teachers, lawyers, authors, doctors and newspapermen were regarded as without the pale of labor organization. On their side, these "mental workers" were apt to turn up their noses at the men in overalls.

Now, English teachers, newspaper workers, clerks and letter carriers have each well-organized unions, conducting frequent meetings and conferences and publishing informative papers and magazines. They have exerted an immense and wholesome influence, not only in obtaining the ameliorations of increased salaries and improved working conditions, but also on the entire morale of the labor movement. Old-time petty snobbishness has largely disappeared and better mutual understanding has been developed all along the line. This advance has been helped greatly by the affiliation of these workers' organizations. With the Labor party, in which so-called intellectuals like Sidney and Beatrice Webb, Commander Kenworthy, G. Bernard Shaw and Sir L. C. Money share the responsibilities of leadership with men who have risen from the ranks like Henderson, Thomas, Barnes and Hodges.

After all, the pretended distinction between mental and manual workers is a stupid one. As Ruskin said long ago, the notion that one-half the population should do all the thinking and the other half all the working is a false and mischievous notion. In normal men and women, thought and action are evenly balanced. Work without art—which means work without thought—is brutal. Thinking worthy of the name finds expression in creative work—in production of some sort. And thought is tested in action. Of course, in the last analysis, every real worker is a thinker and every real thinker a worker. The value of the work and of the worker is in direct ratio to the amount and the kind of thought put into the work.

Unhappily, the lack of genuine mental activity shown by too many "mental workers" offers some justification for Bernard Shaw's sarcastic gibe. This would be a better and happier world if more of our workers would only think now and then.

Mr. Ford's Page

AN ERA of common sense seems to have dawned upon the United States. If it only maintains itself for two or three years we shall be able to drop the "seems to have" and say "has dawned." We have had too much experience as a nation to hail the first furrow as a guaranty of how the whole field will be plowed, but even the most cautious and skeptical of us are ready to say that it really seems as if the new era not only has come (we knew that all along) but has come to the welcome of those who understand it and wish it well. The new era always comes; sometimes it is met with opposition; sometimes it is met with co-operation.

One of the counsels of caution at a time like this is to be very certain that we do not mistake a reactionary turn for a return of common sense. We have passed through a period of fireworks of every description, and the making of a great many idealistic maps of progress, and the utterance of all sorts of noble sentiments, but we didn't get anywhere. It was a convention, not a march. Lovely things were said, but when we got home we found the furnace out.

Reactionaries have frequently taken advantage of the recoil from such a period, and they have promised "the good old times"—which usually meant the bad old abuses—and because they were perfectly void of vision they were regarded as "practical men" and their return to power has been hailed—for a brief illusionary time—as the return of common sense. That is one of the memories that make us cautious. Is it reaction or common sense?

At any rate, the instincts of the people are fairly accurate in gauging the state of public affairs, and the people rather feel that at present we are following a safe and substantial policy and that what we may lack in brilliance in the conduct of our public affairs is more than made up in soundness and sanity. It is a great thing to evoke that feeling in a nation, especially without doing anything sensational, but just by attending day by day the daily duties as they come up. It is a very notable achievement to do that, and the President seems to have accomplished it.

The administration slogan of "less government in business and more business in government" is a very good one, not mainly on account of business or government, but on account of the people. Business is not the reason why these United States were founded, neither is government the reason. The Declaration of Independence is not a business charter nor is the Constitution of the United States a commercial schedule. The United States is land and people, and government and business are but methods by which the life of the people on the land is made worth while. They are servants only, never were anything but servants, and never caused anything but trouble when they forgot for a time that they were servants. The moment the people become adjuncts to business, or to government, that moment the law of retribution begins to work, for such a relation is unnatural, immoral, inhuman—wrong in every way.

Yet we cannot live without business and we cannot live without government. Even the hobo cannot live without business, for it is the most complex mechanical and commercial processes that give him his free rides across the country and provide the bread which he gets as hand-outs at back doors. Even the anarchist cannot live without government; it was the quiet and orderliness provided by government that gave men intelligence and leisure enough to think out the theory of anarchy, and whenever anarchy comes into temporary control it proceeds to institute the most steel-ribbed government ever known. Business and government are necessary as servants, like water and grain are; as masters they overturn the natural order.

It ought to be fundamental that you will never find what is good for business or government until you find what is good for the people, and it is equally fundamental that what appears to be good for business and government is not to be trusted at all, until it has been tested out by the principle of the people's good. We are always treating business, doctoring it, inventing laws which we think will protect or stimulate it. Go to the big conventions—business is regarded as a separate entity, a thing in itself, a separate empire; without a thought of the real fundamental entity, the people, and that encompassing empire, the people's good.

All the business that there ever was is right here now, in the people. Business is nothing more nor less than the supply of the people's needs. The need of the people to eat every day, to be clothed and sheltered, is the basic guaranty of business. If the people should dispense with these needs, there would be no business. Whenever a fool policy interferes with the people's ability to supply those needs in an honorable, orderly way, business slumps. There is always enough Supply—Nature and Nature's God saw to that long beforehand; there is always enough Demand—the recurring needs of human life provide for that; the kink is somewhere in between, in the realm which we call "commerce," and centers around a human invention called "money." The material for business is always present—always present; human interference by man-made laws causes trouble.

One step in the right direction is the new idea which seems to be held by the administration that the problems of the country must be settled in the country proper, and not in Washington. We have fallen into the bad habit of looking to Washington as to some shrine whose oracles possessed all wisdom. Now, whenever sensible men comprise the administration they know that all wisdom is not summed up in them. That is one of the very hopeful qualities of the present administration—there has not yet appeared among them any who imagines himself a superman. They are good workmen trying to do a creditable job and not afraid to ask counsel or assistance when they need it.

But when you get a whole country thinking that Washington is a sort of heaven and behind its clouds dwell omniscience and omnipotence, you are educating the country into a dependent state of mind which augurs ill for the future. Our help does not come from Washington, but from ourselves; our help may, however, go to Washington as a sort of central distribution point where all our efforts are co-ordinated for the general good.

It is, therefore, quite an important fact—much more important as principle than as policy—that the present administration has undertaken to let the United States be the United States with Washington as its office, instead of attempting to make Washington the United States with the rest of the country serving as a very useful back yard.

It puts the country's welfare up to us—all of us. And that is where it should be. A few more years of dependence on Washington, praying to Washington, hoping for miraculous occurrences and showers of blessings from Washington would have placed this country in a condition where almost any demagogue sufficiently beclouded with mystic glory could have come along and led us into the wilderness. That danger is past. We are once more a democratic republic. The autocracy of government, the autocracy of big business, the autocracy of caste have all disappeared, and if they remain out, we may consider that we have scraped through a dangerous place: dangerous because the people hardly scented the danger; dangerous because they were falling into the habit of letting the government do it, the government being a few men who can be seated in a very small room.

The country is now permitted to get under its own problems. The ancient principle is again exalted that the country belongs to the nation. There are no demigods, and we can't use demagogues.

THE present administration has staged a return to common sense which, if given a long enough run, will work wonders. The President does not regard the United States as Washington's back yard. We have had too much of that. Washington has been a sort of heaven where omniscience and omnipotence dwelt, to which the people prayed, and from which miracles and showers of blessings might be expected. We were rapidly falling into the habit of mistaking the government for the nation. The country is getting under its own problems. Washington has ceased to be a throne and has become a clearing house. We are once more a democratic republic. It is an era which the historian might describe as "the return of the American people to the United States."

Looking toward Lake Michigan from the side of a large dune. Note the pine trees, the shrubs, and the flowers in the foreground.

The Fairyland of the Middle West

Sand Dunes of the Indiana Shore: a Magic Country Where Hills Come and Go at the Caprice of a Gale

By J. S. MORRISON

THE sand-dune country of Northern Indiana, extending from Gary to the Michigan state line, is known to people the world over. It is a natural wonderland attractive alike to scientist and layman, to him who understands its secrets as well as to him who is ignorant of its meaning but captivated by its spell. There is no natural park like it in this country or any other. It is unique.

In the first place, the dune region is an uninhabited wilderness. That there is such a spot within a few miles of the center of our population and almost at the very doors of Chicago is itself worthy of note. Yet, while it is a wilderness, it is not a desert.

Moreover, the dunes are a different world from the monotonous flatness of the prairies of Illinois. They are a country of hills and bluffs, gullies and valleys, with all sorts of variations—little lakes, bogs, small streams and meadows. The beach is probably the finest along inland waters anywhere—broad, smooth, clean, free from rocks and quicksands, and sloping gradually into the coolness of Lake Michigan.

To the average visitor the spectacle of the so-called "walking dunes" is the most interesting. Here he sees land in the making. Here today is a towering dune crowned with flowers and other vegetation; tomorrow it is gone, and in its place is a great "blow-out" or saucer-shaped excavation of glistening sand—a silent testimonial of the might of the winds. Today is a deep gash in a bluff; tomorrow its place is taken by a lofty heap of white sand that has come up, grain by grain, out of the lake. Today stands a small forest on the edge of a great shallow pond; tomorrow it is a cemetery, with even the tree tops covered by sand marching in from the beach. Today one sees a glistening mountain; tomorrow it is no more, and its former presence is revealed only by gray, somber tree trunks perfectly preserved but denuded of all bark.

Not all the dunes, however, fall prey to the caprices of the winds. Those which are covered with sufficient vegetation are stationary, being able to withstand the onslaughts of the gusts, which quite often attain a velocity of sixty miles or more an hour. The cottonwood tree is the best sand binder because of its extensive root system, though other trees and shrubs fulfill this kindly mission also. In this connection the wild grapevine must not be omitted; valiantly does it strive to hold together whole hills of fickle sand.

Volumes might be written about the trees of this marvelous region. Both because of their variety and their extraordinary appearance are they worthy of comment. The prevailing type of tree of the northern or windward slope is the pine, of which there are several kinds; while the leeward sides boast principally the oak, the black oak being the most conspicuous on the older dunes. Most of the trees are deciduous, but there is at least one cone-bearer—the tamarack. Here also one can find junipers, alders, cottonwoods, poplars, sour gums, red maples, pawpaws, and willows. One need not be a member of scientific societies to appreciate their indescribable beauty and charm.

Not only the botanist but every other lover of flowers as well will find the dunes a floral paradise, a place where he or she can satisfy the heart's desire in this particular. The visitor will find acres upon acres and miles upon miles of rare and common plants, flowers, and shrubs. Their great diversity of colors will dazzle the eye; their combined fragrance will be the open-sesame to the unlocked memories of childhood's brightest hours.

Among the swamps you will see the yellow of goldenrod contrasted with the purple of asters. You will find violets, several varieties of orchids and pitcher plants. Cinnamon ferns several feet high will not escape you. Here also the blending of browns and greens of cat-tails, sedges, reeds and ferns will give you rest. Farther up, on the hills of sand, grows the wild lupine or wild pea, which, blooming profusely in May and June, enchants the beholder with its beauty of striking purple. Another plant of the same entrancing color is the Japanese iris. Once seen, it will never fade from the mind's eye.

Dune grasses of many species have been noted, which resist with success the heat of summer and the rigors of unusually severe winters. One observer places their number at more than thirty. Among them the wild rye is very much in evidence, attaining, as it often does, a height of eight or ten feet.

If the lover of birds will visit the dunes he will not be disappointed. It has been stated by an accurate observer that more than three hundred varieties of feathered folk visit here during the year. It is believed that nowhere else, during the period of migration, are there more varieties to be found. Formerly great havoc was done the edible game fowl by lawbreaking hunters, but it is hoped that the present penalties are sufficiently drastic to prevent the repetition of such wanton acts. Furthermore, the passage of the Federal Migratory Bird Act and its subsequent approval by the United States Supreme Court will undoubtedly have here a beneficial effect.

Lake Michigan itself, in whatever mood it may be, awakens fancies in the beholder. Hundreds of persons make excursions to this wonderland who are recreated and revived by the charm of the saucy whitecaps of the waves or by the blue-green smoothness of the surface, which begets the peace that passes all understanding. And if one cares to bathe in the refreshing waters he will discover that Nature could have built no finer beach if made to order.

The Indiana sand dunes are a Mecca for geologists. For a period estimated as five thousand years Lake Michigan has been taking material from its west shore, from Chicago northward into Wisconsin, and depositing it at the dunes. Previous thereto the level of the lake was fifty or sixty feet higher than now, and the discharge was toward the Mississippi at a point not far from the present site of the dunes. During this span of time, geologists tell us, about five hundred square miles of land were, in this manner, washed away and deposited—an unparalleled erosion. The student of geology also will be able to see here the action of wind and water upon the soil; to observe the selecting and rearranging processes which control the evolution of the earth's crust, and which, usually consuming ages, here work swiftly almost before the eye.

While the dunes are the source of greatest pleasure and profit during the spring and summer, it must not be supposed that they are forbidding in the autumn or winter months. In fact, the autumn affords perhaps the best opportunity for enjoying the flora of the region. For then the shrubs and trees are gowned in their most gorgeous costumes; then one sees matchless variations of all the colors of the spectrum. And, later on, the snows of winter cause one to imagine that he is in the picturesque hill country of some of the New England States.

What is the present status of this veritable fairyland so far as concerns its ownership? Virtually the entire strip, approximately twenty miles in length and from one to one and one-half miles in width, is owned by private persons. As long as this situation continues this marvelous playground is in grave danger of being lost to the public, to whom it would unquestionably be a blessing. The first agitation for public acquisition of the dunes occurred in 1915, those initial efforts crystallizing in the organization of the National Dunes Park Association, whose purpose was declared to be "to secure, establish, improve, and perpetuate a public national park or parks along the southerly shore of Lake Michigan in the state of Indiana." About that time the United States Senate adopted a resolution directing the Secretary of the Interior to investigate and report to Congress the advisability and cost of securing the sand-dune district for park purposes. Public hearings were held in the city of Chicago in 1916 before Stephen T. Mather, Director of National Park Service, who made a favorable report to his chief. While nothing more has been done by Congress, the project is still very much alive, being fostered by the aforementioned association, by the Indiana Federation of Women's Clubs, and by the public-spirited men and women throughout the Middle West. The people of Indiana have lately come to the front, and have determined to fortify their wishes by having the state acquire Duneland and maintain it as a state park until the Federal Government sees its way clear to take it over.

It is to be hoped that those men and women who believe in public parks and their salutary effects upon lives too often and too thoroughly tainted by the grime and soot and heavy labor of this commercialistic age will manifest a keen interest in a region that is incomparable for its natural beauty. The dunes cannot be duplicated; the works of man can be. To the geologist the dunes are unique; to the naturalist they are a wonderful field of study; to the artist and poet they are an inspiration; to the rank and file of us they are a fountainhead of perpetual wonderment and joy. To fail to preserve them for the benefit of this and future generations will be nothing less than a national calamity.

Working Miracles With Sagebrush and Water

Desert Wastes Will Produce Famed Apples of the Northwest

By CHRISTY THOMAS

AIDED by inexhaustible streams that rush down the valleys of great mountain ranges, western workers of miracles with water today are carpeting with beautiful green apple orchards what only a little while ago was a desert of far-reaching waste. Take the state of Washington. There the water wizards shortly will snatch a mountain torrent from its tumultuous race to the sea, carry it fourteen miles through a mountain of solid rock, and then turn its life-giving waters into another valley. There 40,000 acres of worthless sagebrush land will be made to produce big red and yellow apples, sometimes a hundred boxes to the tree.

The state is supervising the construction, settlement and financing of the project—something distinctly new in this country's agricultural development. Later the state will attract and select its own settlers. Washington is the first state in the Union to have its own reclamation service. It was created in 1919 by act of the state legislature. The act gives broad powers to the state reclamation board, which administers the law, and substantial working funds through a one-half mill tax levy on all state taxable property. The development in question now is in progress and is known as the Methow-Okanogan project. The arid lands to be reclaimed are located in North Central Washington along the Columbia and Okanogan rivers. The Methow River, whose waters are to be used, has its source in glaciers in the British Columbia mountains, across the Canadian border north of the project. The waste land to be reclaimed is situated in the Okanogan Valley, separated from the Methow by an arm of the Cascade Mountains.

It becomes necessary, then, for these enterprising westerners to circumvent nature by utilizing a third river somewhat removed from the lands involved. The connecting tunnel will be fourteen miles long and will cost $2,000,000. Several years will be required to complete it. When it is finished, however, the land will yield products valued at $10,000,000, add over $20,000,000 to the taxable wealth of the state and provide homes for 5,000 persons. According to present plans, these lands will be thrown open to settlement early this year.

The total number of acres irrigated in Washington last year was 547,000, and the commercial production of these lands was $76,000,000. The production of the Yakima Valley alone was $45,000,000, and of the 30,000 acres irrigated in Chelan County, of which Wenatchee is the commercial center, $22,000,000. The production of foodstuffs on the Naches Selah project of 10,500 acres near Yakima was $3,500,000. The Okanogan project of the United States Reclamation Service, on the Okanogan River near Omak, produced a yield of $136 an acre—the highest for 1918 of any of the government projects. The second highest was the Sunnyside, in this state also, with a yield of $102 an acre. The total investment of the United States in irrigation projects is $118,000,000, and the 1918 crop yield was $80,000,000 on those same projects.

"Is it any wonder," asks E. M. Chandler, Washington State Reclamation Service Engineer, "that interest in land reclamation and settlement has been stimulated as never before?"

There are several good and substantial reasons for this. On the one hand our free land is fast diminishing, if, indeed, it already has not gone; and on the other, the world is crying for increased production and more food. The people are hungry for land as never before in the country's history. When these facts are considered in relation to the financial returns made on irrigated lands, this awakened interest is not hard to understand.

Fruit farming in this North Central Washington country not only pays dividends in dollars, but it also adds immeasurably to one's joy in living, to one's appreciation of nature and those things which give to life and occupation out of doors their great appeal.

I recall the impressions of life there as they were given me in the Okanogan by a grandmotherly, gray-haired woman of 62, who keeps house for her two sons on their apple ranch. She spoke first of the mornings, the opal tints in the sky at daybreak and then of the bright, brilliant sunshine, the clear, blue sky of the later hours.

"I wake and sleep," she said, "to the cheery calls of numberless songbirds in the apple trees . . . . by day come the colors of a smiling land; from my window I look out and beyond to brown mountains, veiled by hazes of velvet blue, or to the green of forests of orchards, where trees bend, not with the wind, but with the weight of their red and yellow fruit.

"I know of no finer life or country—both are glorious, even to a woman at my age. Work here has its compensations, apart from monetary considerations, for it is clean and wholesome and healthful. It also has few, if any, of the unpleasant features to be found on the ordinary farm.

"Its financial rewards are perhaps better known. In our own case, we have thirty-three acres and confidently expect a $40,000 crop. The net profit should be about $20,000 for eight months' work. The remaining four months in the year, if we like, we can spend in travel where fancy leads us. As my boys say, 'This is the life.'"

Features of striking interest in the Methow-Okanogan project may be summarized thus:

1. The elimination of speculation in raw lands, made certain by the land settlement program adopted by the state.
2. The state will select its own settlers.
3. Permanent construction of canals and flumes.
4. An adequate water supply.

The lands included in the Methow-Okanogan project will be irrigated and developed by units. The first unit is known as the Brewster flat area and contains 11,140 acres. The other lands in the project will be developed at a later date. The total estimated cost of the Brewster flat unit is $3,369,000, or $302 an acre.

Above—An irrigated orchard in bloom in the Okanogan. This and most of the other orchards developed in the district at present use the pump system of irrigation, getting their water from the Methow, Okanogan or Columbia rivers.

Below—Scene on Methow River, just below the town of Twisp, where water will be diverted for the project.

The record of practically every irrigation project shows speculation in raw lands to have been the chief contributing factor in many failures. For this reason the state reclamation board in considering plans for developing this project decided to eliminate all such speculation. In order that the settler, who must bear the development charge, may not be required to pay more than the actual costs, the present landowners in the project have agreed to limit the price of the raw lands.

The lands to be utilized have been divided by the state reclamation board into two classes—the irrigable and the non-irrigable.

The irrigable lands will be offered the public by the state at $60 an acre and the non-irrigable at $10 an acre. In addition to the $60 payment for the land, the buyer will be required by the state to pay down $100 an acre against the cost of developing the project. A part of the balance may be paid in nominal annual installments, while the remainder will be absorbed in a 40-year bond issue.

The state's land settlement program is unique. Those desiring a farm unit on the project will make written application for it to the state reclamation board. In this way the state will select its own settlers. Before a unit is sold to an applicant he will give to the state definite assurance that he will be able to pay for the land and for the cost of construction, and to carry on the development work successfully.

W. W. Sherman, chairman of the Washington Reclamation Service, says professional men in all parts of the country are heeding the call of irrigated land as never before.

"Fruit farming," says this official, "today appeals strongly to the professional man and the chap who works for a salary. Many in these two classes now own or have an interest in orchards in Washington, and I suppose this is true of other states having large areas of reclaimed land.

"To these men orcharding offers a handsome competence for life away from the grind of office work and an opportunity, in the case of the salaried employe, to engage in business for himself. To both classes it gives a home amid surroundings comparatively exclusive, and excellent remuneration for their labors.

"The reclamation board knows of scores of cases where men have acquired splendid orchard properties in Washington by making a small initial investment and then letting the crops pay the balance. We also find large numbers of parents with sons in college who plan to start the boys in an orchard as a means of teaching them a fundamental occupation—the raising of food."

The type of construction adopted for this project will be of a permanent character as distinguished from the sort which must be rebuilt in ten to fifteen years. Concrete-lined canals and reinforced concrete flumes will be installed throughout the project. One comes now to the fourth feature of the project—the water supply. Too often the agencies promoting projects have obtained an amount of water sufficient to irrigate 5,000 acres of land and then proceeded to sell 10,000 acres. The result is obvious—none of the lands in these projects has received enough water. In the Methow-Okanogan project the state reclamation engineers have given a great deal of attention to water supply. In the first place, it was necessary to obtain a dependable source. Measurements by the state reclamation service, the United States Geological Survey and other agencies, show that the volume of water in the Methow River varies ever so slightly, if at all. In this project the state engineers say they have included only those lands which can be given a steady and adequate supply of water—four acre-feet during the season, or virtually double the amount available in many developments at the present time.

The region in which the Methow-Okanogan project is located is held to be especially adapted to the production of the highest quality of commercial apples. The developed orchards of this region have demonstrated this fact during the last few years. It was an orchard within this particular project that produced the apples which won the grand sweepstakes at the Panama-Pacific Exposition in 1915. The soil there is deep and very fertile. Most of the land in the project lies at an elevation of 750 to 1,350 feet above the sea level. There is also perfect air drainage with the result that frost damage to fruits of any character is practically unknown in the district. All kinds of deciduous fruits and berries of virtually every description grow there to perfection, according to orchardists.

In the work now in progress on the Methow-Okanogan project, the state is proceeding in two different directions to a common end. The reclamation service is represented on the ground by a corps of engineers and surveyors. These men have completed surveys and classifications of the irrigable and non-irrigable lands included in the project, and have also made topographical maps indicating the contour of the property, the latter for the information of the reclamation service when it undertakes the construction work. On the other hand, the land settlement feature already has been started by a state land settlement director, who is handling the diversion of the privately owned lands to the state, for sale later when the commonwealth will offer them to the public for settlement.

At a time when the crying need of our agricultural life is for increased production, the sources of output have been developed to their maximum. A trip through the farming districts of the East and Middle West leaves no doubt of that. The hope of the country for greater production in agriculture, therefore, would seem to lie in reclaiming these western waste lands.

Are the Jews Victims or Persecutors?

A Final Article on the Jewish Propaganda That an Attack Has Been Made on the Jewish Faith: Showing That Jews Attack Christians

"Half of Christendom worships a Jew; the other half worships a Jewess."—Jewish editorial.

"If the gospel story is correct, Judas was a pretty decent sort of a fellow. It was only *after he had become a convert to Christianity that he became that which has made his memory an accursed thing for nineteen hundred years.*"—Jewish editorial.

"Our land is frequently called a Christian nation. No doubt the majority of our citizens believe this. No less an authority than Justice Brewer of the Supreme Court so expressed himself in 1892. But the statement is clearly false . . . . *This is not a Christian nation. In inspiration, at least, it is a Hebrew nation,* for the Constitution which we now enjoy traces back to the Hebrew Commonwealth."—Jewish editorial.

(From the minutes of a meeting of the Committee on Families of the New York Board of Child Welfare.)

Mr. Hebbard: "That is one of the things I have in mind, that a widow brings deliberately into her home a nameless child and the inevitable consequence of that is that her legitimate children are always thereafter pointed out."

Miss Sophie Irene Loeb: "As far as nameless children are concerned, *Christ himself was a nameless child.* Let us get away from nameless children."

Dr. Dirvoch: "I think where there are three or four children in a home and a little stranger enters that home without a father, you are corrupting the morals of those legitimate children by permitting them to remain in such surroundings."

Miss Loeb: "I say to you that this committee if it takes such an attitude as that, is one hundred years behind the times."

Mr. Cunnion: "Anything against purity is immoral."

Miss Loeb: *"What has that to do with the question of purity? Was the mother of Christ pure?"*

Mr. Cunnion: *"Certainly."*

Miss Loeb: *"He had no name!"*

Mr. Cunnion: *"You can't bring that in here. We believe He was conceived without sin."*

Mr. Menahan (to Miss Loeb): *"That is very wrong to make that statement."*—Cited in letter of complaint to Mayor Hylan.

"The intimate relation of church and state in the great non-sectarian United States of America received direct demonstration on August 12 (1913), when a deputy sergeant-at-arms of the Senate was hurriedly sent out to get a preacher of any old denomination to open the Senate with prayer. The session opening an hour earlier than usual, the regular chaplain was not at hand, but with still two minutes to spare the deputy returned in an automobile, hurried to the Vice President's office and introduced the Rev. Dr. C. Albert Homas, of Canonsburg, Pennsylvania, to Mr. Marshall just in time for the Vice President to lead the way into the Senate chamber to open the session at 11 o'clock, and once again the Union was saved. We shudder to think what might have happened if no preacher had been captured in time to open the session with prayer!"—Jewish editorial.

"President Wilson in his inaugural address said: 'The firm basis of the Government is justice, not pity.' This is sound Jewish doctrine as laid down by Moses and the Prophets in contradistinction to the doctrine of love, as attributed to Jesus. This coming from so good a churchman as President Wilson might be a little surprising were it not that it is a well-known fact that whenever our Christian brethren want to talk to reasoning men they go to the Old Testament for their inspiration."—Jewish editorial.

"President Wilson at his inaugural gave another instance of the well-known fact that in solemn moments when they need comfort and inspiration, Christians turn to the Old Testament and not to the New. So President Wilson, when he kissed the bible after taking the inaugural oath, selected the passage Psalm 46."—Jewish editorial.

"Reference has frequently been made in thes columns to a number of addresses made by the late Isaac M. Wise at the celebration in honor of his 80th birthday anniversary in the course of which he predicted *that in a quarter of a century from that date (1899) there would be practically nothing left in Protestant Christianity of a belief in the divinity of Jesus Christ* or the distinctive dogmas of Christianity, and that all Protestant Christians by whatever name they called themselves, *would be substantially Jews in belief.* To any one who notes the signs of the times it is apparent that this prophecy is being rapidly fulfilled . . . . *The Jesus superstition* and the *fantastic dogmas built upon his supposed divine origin,* die but slowly, but that they are dying is nevertheless apparent."—Jewish editorial.

THE subject of this article is "Religious Prejudice and Persecution—Are the Jews Victims or Persecutors?" A study of history and of contemporary Jewish journalism shows that Jewish prejudice and persecution is a continuous phenomenon wherever the Jews have attained power, and that in neither action nor word has any disability placed upon the Jew equaled the disabilities he has placed and still contemplates placing upon non-Jews. It is a rather startling reversal of all that we have learned from our Judaized histories, but nevertheless it seems to be the truth.

Jews Attack Catholic Church

ATTENTION is once more called to the fact that the Jews themselves are not raising the cry of "religious persecution" here or elsewhere, but they are allowing their "Gentile fronts" to do it for them—just as they have not denied the statements made in this series (among themselves they freely admit most of them) but let "Gentile fronts" do it for them. The Jews would not be averse to raising the cry of "religious persecution" perhaps, (provided they could make it stand) were they not afraid that it would call attention to their own persecuting activities. But their "Gentile fronts" have brought that upon them.

There is no Christian church that the Jews have not repeatedly attacked.

They have attacked the Catholic Church. This is of special interest just now when Jewish agents are doing their utmost to arouse Catholic sentiment in their favor by circulating charges which these agents personally know to be false. THE DEARBORN INDEPENDENT has perfect confidence in the information which Catholic leaders may have on the Jewish Question. On this subject the Catholic priesthood is not misled.

Examples of this attack are numerous. "Half of Christendom worships a Jewess," is not a statement but a slur, flung by Jewish men who say in the ritual of morning prayer: "Blessed art thou, O Lord our God, King of the Universe, *who hast not made me a woman.*" The Talmudists' discussions of the Virgin Mother are often vile. The Christian festivals, whose preservation is due to the Catholic custom and conscience, are all attacked by Jews.

Opposed Columbus Day—Why?

THE *American Israelite,* whose great prestige in American Jewry is due to its having been founded by Rabbi Isaac M. Wise, *opposed the establishment of Columbus Day* and berated Governor Hughes for signing the law making it a holiday in New York. The act that established it deserved "the contempt of thinking men." Why? Is not the Discovery of America a memorable event? Yes, but Columbus was a Catholic! However, in recent months the Jews are proving him to have been a Jew, so we may expect some day to see Columbus Day insisted upon with Jewish rites.

The *Catholic Columbian* made editorial reference to the increasing Jewish influence on the American press, in these words: "Jewry is getting its grip on the news of this country as it is on Reuter's and the Havas agency in Europe."—A perfectly polite and true observation.

But the Jewish editorial thunderer came back—"The *Columbian,* in its sneaking Jesuitical way, does not mention the fact that these (the Jewish) papers are the very cleanest in the country. The *Columbian* cannot point to a single daily owned by one of its coreligionists that begins to compare with the above papers."

The sweet spirit here evidenced is very significant today when an appeal is being made to create a strong pro-Jewish Catholic sentiment.

If there is in the world any extra-ecclesiastical undertaking by Catholics which has won the undivided approval of the Christian world as *the Passion Play of Oberammergau* has done, the present writer does not know what it is. Yet in a volume entitled *"A Rabbi's Impressions of the Oberammergau Passion Play,"* Rabbi Joseph Krauskopf, D. D., of Philadelphia, has stigmatized that notable production as reeking with falsehoods and vicious anti-Semitism. In the rabbi's eyes, of course, it is, for to him the entire Christian tradition is a poisonous lie. The whole fabric of Christian truth, especially as it concerns the person of Christ, are "the hallucinations of emotional men and hysterical women."

Denounce "Passion Play" and "Wayfarer"

"THUS," says the rabbi (p. 127) "was invented that cruel story, that has caused more misery, more innocent suffering, than any other work of fiction in the range of the whole world's literature." And thus the simple peasants of Oberammergau, presenting the Catholic faith in reverent pageant, are labeled anti-Semites.

These are not isolated instances. Antagonism to the Catholic Church runs throughout Jewish literature. The Jewish attitude was summed up in an editorial in the *Jewish Sentinel* of November 26, 1920, as follows: *"Our only great historical enemy, our most dangerous enemy, is Rome in all its shapes and forms, and in all its ramifications. Whenever the sun of Rome begins to set, that of Jerusalem rises."* These, however, are matters well known to Catholic leaders.

In their turn the other Christian denominations have been attacked. When *the Methodist Church* put on the great pageant entitled *"The Wayfarer,"* Rabbi Stephen S. Wise played critic and made the solemn and silly statement that had he been a South Sea Islander (instead of the itinerant platform performer which he is) his first impulse, after seeing "The Wayfarer" would have been to rush out into the street and kill at least three Jews. It says a great deal, perhaps, for the channel in which Rabbi Wise's impulses run, but the tens of thousands of Methodists who saw "The Wayfarer" will not be inclined to attribute such a criticism to the spirit of tolerance which Rabbi Wise so zealously counsels the Christians to observe.

Attack Christian Churches and Societies

THE Episcopal Church also has felt the attack of the Jews. Recently the Jewish press raised a clamor that the Episcopal Church was not competent to teach Americanism in our cities because it held that Christianity and good citizenship were synonymous. And when the Episcopal Church made provision for mission work among the Jews, the torrent of abuse that was poured out gave a very vivid picture of what the Jewish mind naturally turns to when aroused. This abuse is not reproduced here because of its excessive violence and disrespect. It is similar to that which is heaped upon all attempts to explain Christianity to the Jews. "What would the Gentiles do if we sent Jewish missionaries to them?" ask the violent editors. Any Gentile can answer that—nay, even the Jews themselves can answer that. In the first place, the Jews do not want to teach their religion to Gentiles because there is a Talmudical restriction against it; Talmudically the Gentiles are not good enough to mingle with the religious matters of the Jews. In the second place, the Jews do send missionaries everywhere, not to spread Jewish religious principles, but propaganda favoring the Jews as a race and a people, as is done in our colleges through the so-called "Jewish Chautauqua." In the third place, let there be produced one Jewish missionary, who has ever received anything but a considerate reception wherever he has appeared.

The Jews are bitter against all Christian denominations because of the conversion of numerous Jews to them. A large number of Jews have become Catholics; one of the *Knights of Columbus'* most useful lecturers against the menace of radical socialism is a converted Jew. It is so also with *the Presbyterian Church* which has been the most recent victim of Jewish vituperation. But only upon the Catholic Church has the Jew poured more wrath and malediction than he has poured upon *Christian Science.* The Christian Science Church has attracted large numbers of Jewish converts. Some of them have become very active, devoted members of that form of faith. Scores of columns and pages have been devoted to their denunciation in Jewish newspapers, magazines and books. Christian Science is a peculiar anathema to the Jew.

Where then is the religious prejudice? Search through the publications of all the churches named, and you cannot find in all their history so much of the spirit of prejudice and persecution as you can find ex-

pressed in the Jewish press in one single day. Jewry reeks with such prejudice. In politics, education, social functions, public holidays, literature and newspapers, they see everywhere traces of "Christological manifestations," and cry them down.

Attack Christian Public Men

NO PUBLIC man has ever given public evidence of his Christian faith without rebuke from the Jews.

Mr. Bryan, Mr. Marshall, Mr. Taft, Mr. Wilson, two of them Presidents, one of them Vice President, and the other Secretary of State, have all been called to task from time to time for their sins in this respect. Mr. Marshall is a devout man, whose faith is real to him, and he speaks very naturally about it at times. He has, therefore, been attacked oftener in the Jewish press than has any other public man of recent times. Nothing is more ludicrous to the Jewish press than a Vice President of the United States openly confessing that he is an "idolator," that is, a worshipper of the dead Jewish imposter whom the Christians ignorantly call "Christ." To Mr. Marshall's honor, be it said, he never apologized, he never begged to withdraw his public statements. Neither did William J. Bryan, whose lecture "The Prince of Peace" contained statements in honor of Christ which brought him into conflict with Jewish spokesmen everywhere, and whose remarks about missions after a trip round the world were savagely attacked by Jews. Mr. Bryan did not apologize either. Mr. Taft was promptly called down on several occasions for using forms of the word "Christian," which were particularly offensive to the Jewish press because they had advertised far and wide during the Taft campaign that Mr. Taft was practically a Jew in his belief in that he had abandoned all the distinctive Christian doctrines pertaining to Christ. After his lapses in which he used the term "Christian" approvingly, it was explained on his behalf (1) that he was accommodating himself to the audience, and (2) that he used the term as a synonym for civilization! But isn't it significant that the name of Christ should be an integral part of the very name of the highest civilization? Mr. Taft was a true liberal, liberal enough to tolerate Christian orthodoxy. And that was a rather weak spot, as far as the Jews' estimate of him went.

President Wilson Makes a "Break"

MR. WILSON, while President, was very close to the Jews. His administration, as everyone knows, was predominantly Jewish. As a Presbyterian elder, Mr. Wilson had occasional lapses into the Christian mode of thought during his public utterances, and was always checked up tight by his Jewish censors. In 1914, speaking before the American University at Washington he said:

> "That is the reason why scholarship has usually been most fruitful when associated with religion, and *scholarship has never been, so far as I can at this moment recall, associated with any religion except the religion of Jesus Christ.*"

That was terrible. So terrible that Herman Bernstein was chosen to administer the castigation.

And Mr. Wilson made proper reparation:

> "My dear Mr. Bernstein: I am sorry that there should have been any unfair implication in what I said at the opening of the American University. You may be sure that there was nothing of the kind in my mind, or very certainly nothing in my thoughts that would discriminate in the important matter you speak of against Judaism. I find that one of the risks and penalties of extemporaneous speaking is that you do not stop to consider the whole field, but address yourself merely to the matter in hand. With sincere respects and appreciation,
>
> Cordially yours,
>
> Woodrow Wilson."

The heading given this notice in the Jewish press was, "He Did Not Mean It."

Attack Christian Cults and Festivals

ALL of the President's offending took place in 1914. The second offense he gave was by taking the position of honorary chairman of the International Lord's Day Congress, which was to be held the next year in connection with the Panama Exposition. It was, however, the Christian Sunday which received the bulk of the abuse on that occasion.

The subject is "religious prejudice." Where does it exist in this country in more continuous and virulent character than among the Jews? Read these items selected at random from Jewish papers:

"District Grand Lodge No. 4, Independent Order B'nai B'rith, voted at the annual election held in San Francisco, March 2 (1911) to exclude from the order Jews who join *the Christian Science Church.* The body after earnest discussion decided that the portals of the order shall be closed against the Christian Scientist Jews on the ground that such Jews have abjured Judaism. The vote upon the question was almost unanimous."

"The Jewish Community at Philadelphia has found it necessary to publish a warning to the Jewish people against *the Daily Vacation Bible Schools* which are being established in various parts of the city, also against certain missions and settlement houses, all of which are *traps into which Jewish children are decoyed for the purpose of seducing them from the religion of their parents.* These institutions belong to that class of conversionist agencies which wage a campaign for the seeking of converts through *workers . . . . (who) are a class of criminals that keep just within the law and deserve no better treatment than is usually accorded to people of that kind.*"

When a bishop of the Episcopal Church said, "We must make the United States indisputably a Christian nation," the Jewish press retorted that such a thing could not be done until the Constitution of the United States had been "abolished." "Christian America" is a persecuting term according to the professional Jewish spokesman, and the most laborious efforts have been put forth by them to prove on paper that the United States is not and cannot be Christian.

Not only do the Jews *disagree* with Christian teaching—which is their perfect right, and no one dare question it—but they seek to *interfere* with it. It is not religious tolerance in the midst of religious difference, but religious attack that they preach and practice. The whole record of the Jewish opposition to Christmas, Easter and certain patriotic songs shows that.

When Cleveland and Lakewood arranged for a community Christmas, the Cleveland Jewish press said: "The writer of this has no idea how many Jews there are in Lakewood, but if there is only one, there should be no community Christmas, no community religion of any kind." That is not a counsel of tolerance, it is a counsel of attack. The Christmas literature of American Judaism is fiercer than the flames of the Inquisition. In the month of January, the Jewish press has urged its readers to begin an early campaign against Christmas celebrations the next Christmas—"Only three hundred and sixty days before Christmas. So let us do our Christmas arguing early and take plenty of time to do it."

If anything, Easter is attacked yet more bitterly. But we refrain, for good reasons, from repeating what Jews commonly say on such occasions. The strange inconsistency of it all is to see the great department stores of the Levys and the Isaacs and the Goldsteins and the Silvermans filled with brilliant Christmas cheer and at Easter with the goods appropriate to the time. The festivals of the "heathen" are very profitable. Jewish merchants have been chided for this—not overseverely—by certain rabbis. But on the whole the rabbis had better remain content, for there are no forces more rapidly secularizing the two festival days than are the merchandising and profiteering forces.

Prophesy End of Christian Religion

EVEN religious intolerance has its gleesome moments, and the Jews' come whenever the signs appear of the greater secularization of the church. One parallel between the Protocols and the real hopes of the Jews is written in *the common Jewish prophecy that Christianity is doomed to perish.* It will perish by becoming, to all intents and purposes, Judaism. And it will become Judaism, first, by ousting all the doctrines pertaining to the person of Christ, excising from the Gospels the great "I Ams" which are His distinctive teachings concerning Himself; and, second, by devitalizing Christianity of all the spiritual content which flows from a union by faith with a Person believed to be divine. That is the only way it can be done. There may be a union of all the churches of the Christian faith because the fundamentals are the same; no union of Christianity and Judaism can occur unless Judaism takes in Jesus as the Messiah, or unless Christianity ejects him as the Messiah. Judaism sees the union coming by the ejection of the Lord as the Messiah, and rejoices at every sign of it.

Dr. Charles F. Aked, who has since blossomed out as a Jewish spokesman, delivered a sermon in which he cast aside all the "supernatural" elements in the life of Christ, from His birth, to the significance of His death, and was hailed by the Jewish press as *"the fulfillment of the prophecy that within fifty years the religion of all the American people, outside the Catholic Church, would be Judaism in principle even though not in name."*

"No Jew," says the *American Israelite,* "will conceal his gratification when he finds Christians virtually admitting that liberal Christianity is practically an acceptance of the doctrine of liberal Judaism."

Unfortunately, this is true. Liberal Christianity and Liberal Judaism meet, but only by the surrender of all that is distinctively Christian in doctrine. A liberal Christian is more Jewish than Christian. The statement may sound harsh and arouse resentment, but it is a very simple matter for any liberal Christian to convince himself of this by reading the volume of liberal Jewish doctrine put out by Kaufman Kohler, president of the Hebrew Union College. Liberalism is the funnel by which Christianity is expected to run into Judaism, just as liberalism so-called in other departments of life is expected to bring about certain other Jewish aims.

"Liberalism" in Jewish thought means a wide-open country in every way. Judaism has opposed every significant reform that has come to the country; prohibition, Sunday decency, movie and stage regeneration, and community reverence for sacred things. Judaism has been the prop of the liquor traffic, Sunday desecration, movie and stage excesses, and public contempt for the sacred things of the prevailing religion; and it is all too evident that the Jewish propaganda has made serious inroads everywhere.

A Congregational Church in New Jersey decided to abandon the Bible in some of its classes and substitute sociology, politics, municipal government and kindred subjects for study, and the Jewish press hailed it as another sign that the church was "in a fair way to adopt what is in substance American Judaism." In St. Louis a clergyman, instead of preaching sermons, began to act out moralistic dramas which he himself had written, and the Jewish press again hailed it as a sign of the dissatisfaction of the Christian with his church. Everything done in every branch of the Christian church has been closely watched, and wherever a departure occurred from the distinctly Christian position it was extravagantly applauded; and wherever loyalty to the landmarks appeared, it was just as extravagantly condemned. Judaism does not wish the Christian church to remain Christian. This accounts for destructive Higher Criticism being almost exclusively the work of Jews, although the world has long known them under the guise of "German critics."

Anti-Semitic "Battle Hymn of the Republic"

JEWISH intolerance today, yesterday and in every age of history where Jews were able to exert influence or power, is indisputable except among people who do not know the record. Jewish intolerance in the past is a matter of history; for the future it is a matter of Jewish prophecy. One of the strongest causes militating against the full Americanization of several millions of Jews in this country is their belief—instilled in them by their religious authorities—that they are "chosen," that this land is theirs, that the inhabitants are idolators, that the day is coming when the Jews will be supreme. How can they otherwise act than in agreement with such declarations? You can see what is meant if you read Jewish articles describing the shoving aside of the New England people by the Jews; the supercilious attitude adopted toward the stock that made America is merely a foreshadowing of what would be the complete attitude if power and influence made it possible. Bolshevism, which began with the destruction of the class that contained all the promise of a better Russia, is an exact parallel for the attitude that is adopted in this country regarding the original stock.

We are not permitted by the Jews to sing the "Battle Hymn of the Republic" in our schools because one of the stanzas has a Christian flavor. The Jews claim that the presence of one Jewish child in an assembly of children ought in "fairness" to prevent the singing of that historic song.

Norman Hapgood, writing in a Jewish publication, said: "I need hardly explain that I do not think Jews ought to insist overmuch on their rights or nationality in a negative sense. They ought to be as much Jews as they can, but ought to be as little as possible of what is merely anti-Christian. For the Jews to try to get a song out of the public schools because it praises Jesus is perhaps natural but hardly wise." Mr. Hapgood received a lot of abuse for his well-conceived counsel.

Where, Then, Is Religious Prejudice?

AGAIN we come to the end of our space with the record hardly scratched. Sufficient has been presented to show the strong, unceasing anti-Christian activity of the Jews in the United States. Had the Jewish press been read extensively by non-Jews during the past 15 years, this present series of articles would have been unnecessary—the people would have known the facts. It is to present some of the facts that are illustrated in the Jewish press along the line of religious intolerance that these two articles have been written.

Jewish spokesmen plead for suppression of facts in the name of "religious tolerance," and they denounce exposure of the facts as being "religious persecution." Read the whole non-Jewish religious and secular publications, and you will not find one one-hundred-thousandth part of the animosity against the Jewish religion which is found in the Jewish press—continuously found week after week for long years—against the Christian religion. The present writer has never seen nor heard of an article attacking the Jews' religion.

So, once for all, in spiking the cry of "religious persecution," we show that it exists in quantity and strength among the Jews—nowhere else. No one imbued with the American spirit would or could condemn, hinder, or even remonstrate with any person on account of the faith he holds.

As to "religious prejudice" or "persecution" entering into the present series of articles—there they are, reprinted in booklet form for permanent examination: where is the prejudice or persecution? *Cite the page!*

Jewish spokesmen would use their energy to better advantage, and more to the honor of the Jewish people, if they would address themselves to *what is in the articles,* rather than to what is not in them. The statements made by THE DEARBORN INDEPENDENT have been voluminously *discussed;* but they are still awaiting an *answer.*

Volumes One and Two of *"The International Jew,"* 236 and 256 pages respectively, sent to any address upon receipt of 25 cents each in stamps to cover printing and mailing cost.

Are We Buying Peace or Trouble?

By E. E. MILLER
Editor Southern Agriculturist

An Interesting Study of Disarmament From a New Viewpoint

ACCORDING to a statement prepared by the clerks of the Committee of Appropriations of the national House of Representatives the Federal Government is going to need at least five billion dollars the next fiscal year. It will get along on maybe a billion dollars less, by carrying over part of its 1922 expenses to the next year.

For what is this vast sum of money to be spent?

Run down the list. The Army will get $346,703,000 in round numbers; the Navy, $396,000,000; fortifications, $18,000,000. Pensions will absorb $265,500,000; hospital facilities for soldiers of the late war will take $18,600,000; the interest on the public debt will amount to $922,650,000; the sinking fund to $265,755,000. All these are to pay for past wars or to prepare for new ones. Wars are responsible for practically all of the deficiency appropriations of $275,500,000, and for a goodly share of the Sundry Civil expense of $384,196,000. This item was only $127,000,000 in 1916.

We all know, from acute personal experience, who furnishes this money. We do it.

We complain mightily about it, too; but most of us evidently have failed to reason seriously about it.

We are taxed so heavily because we have been at war and because we expect to be at war again. The expense account left by our past wars is unescapable. Most of us are firm in the belief that we were justified in taking it on. The expenses daily incurred in the preparation for future wars is not unescapable. Many of us are coming to believe that it is neither necessary nor wise that we devote so large a part of our earnings to this purpose.

There has been much talk of reducing taxes and of government economy. Just a few minutes with the appropriation figures will make it apparent to any citizen that no substantial reduction in taxation can come until the nation reduces its expenditure for armament. If the world is to remain an armed camp and the United States is to lead the world in preparation for war, there is no reasonable hope of lower taxes. Some of the tax reduction talk is amusing. Senator Penrose, a few months ago, came out strongly for reduced appropriations, and spoke of the agricultural appropriation as a good place to begin economizing. If the agricultural appropriation were cut out entirely, it would mean a total lessening of taxes for this next year of about 33 cents per capita. We shall pay approximately $3.20 per capita for the Army; $3.70 for the Navy; $2.40 for pensions; over $11 for interest and sinking fund on our war debt.

"But," we are told, "the money we pay out for the Army and the Navy and fortifications is money spent for insurance against war. Big as our annual appropriations for these purposes seem, they would amount in a decade to less than the cost of one year of war.

Admitting that there is something of truth in this, we need to ask ourselves a few straightforward questions and to answer them with equal straightforwardness to determine just how much of error is mixed with the truth.

One question we need to ask is: Granting that armaments are insurance against war, do we need all the insurance we are carrying or preparing to carry?

There is all the difference in the world between our present military program and absolute "disarmament." No one has seriously proposed that this country dispense with its army, scrap its navy and, as we so often hear it said, "remain unarmed in a world of armed nations." That is not the proposition at all; the idea held by the citizens who would reduce expenditures for war preparation is that this country is overdoing the matter of "getting ready to protect itself," that it has no call to arm itself to the teeth, and that instead of its present policy of burdening its citizens to outstrip the rest of the world in warlike preparation, it should be trying to find out just how little of such expenditure it can safely make. The United States is the world's foremost preacher of peace and international good will. Its President is on record as favoring the reduction of armament. At the same time, it is the world's foremost nation in war preparations, and is, in effect, inviting other nations to disarm first so that it can do so later. It is time for us to square our practice a bit better without our preaching.

Another question we may well ask ourselves is: Granting that war is to come, are fighting men and death-dealing equipment all the preparations we can make for that war—does money spent for armament add more to a nation's ability to fight and win than does money spent for some other purposes?

This will seem a foolish question to some citizens. Even the war just closed has not taught many people—some of them, unfortunately, in Congress—that a nation's fighting capacity is not measured solely by the number of its soldiers, the size of its cannon, the weight of steel its battleships can hurl, the skill of its airmen and the perfection of their machines. Yet, if the war taught anything, it taught just this thing. A nation must, of course, have fighting equipment to fight; but it must have something back of that equipment. It must have wealth—a reserve fund to draw upon—and it must have productive capacity—the ability to renew the wealth that war consumes. It is quite possible for a nation to spend so much for war equipment that it cannot effectively use that equipment. Russia did just this thing. The biggest army in the world fell a victim to ignorance and poverty at home. There is reason to believe that Japan is burdening herself so heavily with military expenditures and ambitious naval programs, that the nation would find it hard, indeed, to sustain the weight of the armament for more than a few months of real warfare. No one can question that it was this inability longer to run its own war machine that caused Japan to reduce so greatly its "irreducible minimum" at the close of the Russo-Japanese War. Germany was strong for war because, along with the military preparation, industrial preparations for war had been steadily made. Germany was not spending money on armaments, as the United States professes to be, to insure against war—Germany was getting ready to go to war. That this country will ever devote itself for a generation to organizing all its industry for some foreseen and premeditated war, is a thing unthinkable.

Let us take a concrete case or two: We spend less on the national Department of Agriculture in a year than a modern battleship costs. Does anyone believe that a year's work of the Department of Agriculture adds less to our national strength for conflict than another battleship would? Take a half, or a fourth of the money we spend on education and devote it to building ships and airplanes and training soldiers—would we be more able to resist a foreign foe than if the money were spent on the training of our youth? Reduce our road-building expenditures a few hundred million dollars for the next five-year period, and put the money out for purely military purposes—would the nation be in better position to fight?

These questions are self-answering. Granting that war must come, and granting—what no one disputes—that a great nation absolutely without armament might easily be conquered by a smaller nation well equipped for war, the fact remains that, beyond an equality of armament with its possible antagonist, a nation can best prepare itself for war by adding to its wealth, its productive capacity, and the intelligence and stamina of its people. Money spent for military and naval equipment is money taken directly away from the nation's productive capital. Money spent in the promotion of commerce or industry, for sanitation and education, may add many times to the nation's working capital.

Standing as we do, with at least equal equipment for war with any other nation, and with everything to gain by peace and the development and progress that peace only can give us, is it not time for us of America to lessen, and lessen greatly, the tremendous expenditures for war preparation? Above all, is it not time to show the world that we not only do not wish strife with any other nation, but that we so desire peace that we are willing to seek for it, and to prepare ourselves for it?

Still a third question we may well ask ourselves is: Do great armaments always insure a nation against war—have they not often been the promoters and provokers of war?

We cannot convince other nations of our good intentions toward them by straining every nerve to outstrip them in weapons of war. We cannot reasonably hope to secure peace by so thoroughly preparing ourselves for war that all other nations will stand in awe of us and that our word will be law to the rest of the world. A few Americans hold that idea of peace and the way to obtain it. Many Germans in 1914 held the same idea. This country cannot follow in Germany's footsteps without reaching Germany's goal.

We are now grinding ourselves down with taxes to make war preparations that excite distrust and fear abroad and so make war all the more likely. It is time for a change of policy—not for complete disarmament, nor any outburst of national quixotism, but for the diverting of a large part of the money, the energy and the thought that is now going into the machinery of death and the training of our young men for slaughter into the nobler activities of business and education and culture—into the things that will bring progress and prosperity at home, and by broadening the vision and developing the finer instincts of our citizens make for a love of justice and fair play that will do more than arms can do to keep us at peace with other peoples.

Our Vital Need: More Business in Government

Concluded from page 2

means of a Secretary of Transportation, who can pulse overnight variations, inconstant virtues, and their relation to the country's welfare.

Once or twice a feeble voice of protest has been heard against enlarging the Cabinet. It is alleged that a group of twelve men cannot confer efficiently. That, of course, is debatable, but presuming that there is some truth in the assertion, it does not necessarily follow that because the Cabinet consists of ten or twelve men all must be present at a meeting.

But as between the pressing questions of the hour, it is obvious that a Secretary of Transportation would be a much more needed official these days than some other secretary whose duties are more normal, less inconstant, and not at all entitled to the President's attention twice a week.

The really justifiable Cabinet meeting would be restricted to the secretaries of State, Treasury, Agriculture, Commerce and Labor. But with the exception of the State Department, all others are influenced more or less by the state of our railroads and merchant marine; it is futile, therefore, to say that our Cabinet meetings today embrace the nation's interests. But these five or more, precisely six, departments have jurisdiction over every possible problem, and active problems too. The other departments deal strictly with passive questions. A delay of a day or a month in adjudicating any problem met by the departments of War, Justice, Post Office, Navy and Interior, and inferentially the proposed Department of Public Welfare, would have no serious nor costly results. While these departments are technically equal, their importance in practice is far from equal.

One who knows his Washington—and presumably every business man knows—can imagine the snarl that would follow if the suggestion to eliminate the United States Shipping Board and the Interstate Commerce Commission were seriously advanced by any one other than the President of the United States. One need only think of the officials that would be legislated out to contemplate the secret influences set to work against the plan.

Yet every duty of those two commissions belongs to one department, the Transportation Department herein suggested. The Jones Shipping Bill of last year recognized that the two branches are integral by a provision of law with regard to rate adjustments.

The ideal Department of Transportation should consist of the Interstate Commerce Commission, Shipping Board, Bureau of Navigation, Bureau of Steamboat Inspection, Bureau of Lighthouses, Inland and Coastwise Waterways Service, Bureau of Public Roads, Board of Engineers for Rivers and Harbors, Mississippi River Commission, and the Panama Canal. As aviation is essentially a new transportation science in its infancy, it should come within the jurisdiction of this department.

The Department of Public Welfare, which has drawn the fire of official opposition of the American Federation of Labor, but which is President Harding's original idea toward a Federal reorganization at Washington, is likewise necessary.

The Department of Public Welfare, as so far suggested, does not seem to go far enough, and it would seem useless to organize a new department unless it is organized completely. Thus the new department should include the following units: Bureau of Pensions with which should be combined War Risk Insurance, Bureau of Public Health, the Census Bureau, the Bureau of Education, Hygienic Laboratory, Children's Bureau, Women's Bureau, American Red Cross and the national hospitals.

For the sake of economy there should be a central purchasing and distributing agency, combined with the General Supply Committee, to replace the existing wasteful system of a separate purchasing agent for each department, commission and board as at present.

There should be, too, for the sake of both the public and the press, a Federal Information Bureau for the distribution of all public printed matter and information. There is no reason or excuse for the score of bureaus of publication and publicity and information existing now. The service to the public would be more than fulfilled by such a centralized issuing office, built up possibly from the office of the Superintendent of Documents, as a centralized issuing office.

But reorganization means more than a change. It means more than a mere shifting of given bureaus from one jurisdiction to another which would amount in fact to a change of address and no more, but the establishment of two new homogeneous departments and the simplification of others, so that the Cabinet, in conference with the President, would reflect the interests and problems of the entire nation and not a few scattered problems half of which—as strictly intra-departmental—are too commonplace to thrust on the attention of a complacent but overworked President.

Even if no change were decided on for the present (a decision to be expected, by the way) it would be advisable for Congress to amend existing laws in two separate instances, so that the organic acts creating the Interstate Commerce Commission, the Shipping Board, and the Federal Trade Commission, and possibly other independent bodies, shall be more adaptable to the public service. One provision should be that the secretaries of the Treasury and of Commerce, singly or together, shall be ex-officio members of the boards mentioned.

By this means the President could exercise a beneficial control with due regard to those needs of which he is the final arbiter. It is pertinent to remark that the habit of calling on the President to adjudicate questions which commissions fail to settle satisfactorily has become too evident, and the President should be freed of these tasks. If he is to be the final arbiter the commissions are not at all necessary, because testimony could be taken in less expensive ways.

President Harding lost a good opportunity to reorganize the government—for after all it was and remains his task and not that of his advisors—by not formulating the needed changes before he had the first conference, even, with those he had in mind for important public office. In fact, two or three of them have practically made it impossible for him to make any radical changes because their views of record are virtually ultimatums.

Cottony-cushion scale, enveloped in the "honey-dew," which the Argentine ant loves and which is the cause of the ant becoming the "carrier" of this destructive scale insect.

By HARRY H. DUNN

Close-up of the Japanese or camphor scale. According to government entomologists, this is the most destructive of all the scale insects.

THE United States Government has been called upon, and has responded with men and money, to combat a new insect invader, which, with less than six months' residence in this country, already is costing the horticulturists, florists and nurserymen of one state some $200,000 a year, and has created a situation which demands a minimum of $50,000 to check the invader, more to be spent thereafter in destroying him in his landing place. The invasion is due to a combination of legs and stomach, the latter being in the possession of a new scale insect, which has no legs, and the former belonging to the Argentine ant, whose stomach does not enter into this story.

The active destructive agent is the Japanese camphor scale insect, which, peculiarly enough, has so many insect enemies in Nippon that it never has been considered a menace. It appeared about six months ago on the camphor trees of New Orleans, spreading from this beautiful tree to 96 other varieties of trees and shrubs. Unlike Japan, Louisiana offered no insect enemies to this pest, and now city, parish and state are up in arms against it, while the Department of Agriculture has sent two scale-insect experts to conquer this new destroyer. With only half a year of residence in the United States, the Japanese scale bids fair to surpass in the cost of its ravages the red scale, to suppress which the orange-growers of California and Florida annually spend hundreds of thousands of dollars, or the cottony-cushion scale, on which, two years or so ago, New Orleans alone expended some $25,000 before the pest was eradicated.

Indeed, the new scale from the Orient is more dangerous than either of the other two, because, while they had no means of locomotion, and had to remain where they were hatched, the new scale is carried hither and yon by the millions upon millions of ever-active Argentine ants, and survives the coldest weather in the warm nests of these last-named insects. To eradicate the Japanese scale, every Argentine ant must be destroyed, and the magnitude of this task may be imagined when the word of a prominent government entomologist is taken that "one nest of the Argentine ant may contain as many as seven million individual ants." This same authority adds, as a sort of afterthought, that "the average ants' nest may contain and preserve throughout the coldest winter 500 to 1,000 scale insects."

The ant has no altruistic motive in housing and carrying about the scale insect, however; nor is he in any plot with the invader to destroy the trees of the United States. Like the cottony-cushion scale, the Japanese scale exudes a glutinous secretion—called "honey-dew" for want of better name—which forms the ant's favorite dish. To get this, the ant preserves the scale insect in his nest, and, wittingly or unwittingly, carries the tiny babies of the scale insect on his legs, dropping them here and there, probably by chance, on the shrubbery and trees over whose branches he passes. It is estimated that the average scale insect produces a minimum of 5,000 young in a season—and, as far as yet ascertained, nothing destroys these young except the elements, wind shaking the trees, rain washing the eggs and young to the ground, and cold weather chilling them to death. No amount of natural heat will destroy them. In Japan, there are insects and birds which prey upon this scale to such an extent that it never has become noticeably destructive. Such insects or birds have not been found in the United States in the first six months of the scale invasion, but experts of the Federal Government are now at work looking for winged allies in their fight on this destroyer.

The new scale insect works much more rapidly than any other insect invader with which the Department of Agriculture has had to contend. Trees 20 to 30 feet in height, which were in perfect health six months ago, when the Japanese scale first appeared in New Orleans, today are mere skeletons, rising leafless in the streets, possibly with a little life in the roots, but with the entire trunk above ground destroyed. Not only do these insects feed voraciously, destroying every green leaf, all the sap and every tender branch, but they exude a toxic poison, deadly to the life of the plant. This poison has not been found in any other scale insect, so that this newcomer is by far the deadliest and most destructive of all the foreign insect pests which have invaded the United States, with the possible exception of the pink boll worm, against which the cotton interests are now waging a battle throughout the Cotton Belt of the South.

Horticulturists of Louisiana, the state department of agriculture of Louisiana, heads of the sugar and cotton industries (for the new pest also attacks sugar cane and cotton stalks), the park commission of New Orleans, the Louisiana state department of conservation, the lumber interests—in fact every city and state department, every man and corporation in any way connected with the production of anything from the soil, combined in the appeal to state and nation for funds and men with which to fight the invader. They cited the example of Massachusetts, which, at first refusing an appropriation of $30,000 with which to fight the Gypsy moth, has since spent more than $17,000,000 without conquering the pest, which is estimated to have killed more than 100,000 fine trees in the state.

Leading this fight to confine the ravages of the new pest to Louisiana, until it can be destroyed, is Ernest R. Barber, Federal entomologist with the United States Department of Agriculture, stationed at the Louisiana state university sugar experiment station in Audubon Park, New Orleans. Declaring that the Japanese scale, if not checked, will destroy every bit of green life in New Orleans, Mr. Barber says:

"It is necessary to emphasize the important point that an insect is hardly ever a pest in its native habitat. The boll weevil is hardly known in Mexico; the Argentine ant is not a pest in Argentina; the Gypsy moth is not a pest in Europe, and the pink boll worm does little or no damage in Northern India, and so on. The camphor scale (Pseudaonidia duplex) is a native of Japan, but, as far as we know, it is not a pest there. It was described in 1896 from specimens collected in Japan, and, shortly after this, was found on plants in a Japanese tea garden in San Francisco. Apparently it was stamped out there, as we have no further evidence of it, except that it has been intercepted a number of

1. Healthy camphor tree. Compare this photo with the others.
2. Camphor tree after three months' invasion of the Japanese scale. It is slowly but surely dying, and the only remedy is to cut every branch back to the trunk.
3. Camphor tree killed by new Japanese scale. Six months before, this tree had no scale and was as healthy and strong as the uninfested tree.

times on plants entering California from Japan. In each case these plants were destroyed. I know of no instance where this scale has been reported as a pest, and can find only 13 references to it in all entomological literature.

"Just how this insect became established in New Orleans is not known, but it must have been brought in on some plant, probably from Japan. (Other entomologists consider that it probably came in on the legs of Argentine ants, which are carried by millions in ships from port to port all around the world the landing of which cannot be prevented.—Author.) It is known to have been in New Orleans only six to eight months, but its spread and multiplication have been extremely rapid. It now covers more than a square mile of the area of the city of New Orleans, and, differing from all other scale insects, appears to be highly noxious; in other words, it requires very few of these insects on a tree limb or branch to kill it, and, thereafter, to destroy the life of the entire tree. Many of the infected trees—in fact a majority of them—are dying very fast and conditions are very, very serious. Urgent steps will be necessary to save the dying trees and to preserve others from attack.

"The trees and plants are killed by the scales attaching themselves to the smaller twigs. These twigs die quickly, and the tree, thus defoliated and poisoned by the peculiar toxic poisoning carried by this insect, soon perishes. The Argentine ant is ever present in enormous numbers to collect the so-called 'honey-dew' secreted by this scale, and the ants foster and protect the scale to such an extent that *they cause it to increase from 900 to 1,000 per cent.* We know of only one way in which this pest can be eradicated, and that is to cut back all plants found to be infested, burn off the stubs, as well as burn the branches cut off, and spray the remaining stumps and cut-back trunks with lime-sulphur, or some equally good insecticide . . . . In addition to this, the Argentine ant must be controlled over the entire infested area, and controlled immediately, to prevent the further spread of the pest after it has been checked in New Orleans. Cost of this work will be heavy, and at least $25,000 is required for immediate use in this city alone. I am of the opinion that more money will be required later, but if less money is appropriated, and half measures are undertaken, it were better not to strive for the eradication of the pest, but merely to undertake control measures."

Mr. Barber, further on in his discussion of the situation, indirectly places the responsibility for the introduction of this newest and most destructive of all the scale insects, on the nursery inspection service of Louisiana, and demands its improvement. He says in part:

"The nursery inspection service of Louisiana is positively inadequate. At this time, only two men are employed to inspect all the nurseries in the state and to take care of all plant shipments out of the state. No provision whatever is made to inspect plants coming into the state, provided these plants bear an inspection tag from some other state. If all nurserymen were honest, this might be satisfactory; unfortunately, this is not the case and dirty plants are being dumped into Louisiana from surrounding states. Not being inspected, these plants are placed in nurseries, and new pests thus continually introduced. State Entomologist Anderson declares that his department, which has to be operated on $5,000 a year, 'is a camouflage to allow the state nurserymen to ship their plants out of the state of Louisiana.' He is about right, and he should be given at least $20,000 a year, so that he might employ a staff of ten or twelve men to inspect all plants going out of and coming into (this latter most emphatically) this state."

Thus, if the state of Louisiana had been on guard, the new and deadly camphor scale would not have entered the United States, or would have been destroyed as soon as it did enter, as it was destroyed by the California state authorities some years ago. As it is, the state of Louisiana, only through efforts of the state horticultural society, has placed an embargo on the shipment of all plants out of the parishes of Orleans and St. Bernard. This does not affect any other parishes of the state, or the state boundaries, so that there is no means of checking the spread of the scale through the state, or from this state to other states, or of knowing how far it has spread, unless the national government takes immediate charge of the situation, and either places its own embargo or compels the state of Louisiana to place such a wall around the infected spot.

It is estimated by the nurserymen's organizations that the local embargo will cost them about $200,000 a year, and many of them are opposed to it, regardless of the danger to all crops within the state and in other states. Sugar experts estimate that the new scale, if it reaches the "sugar bowl" of Louisiana, will destroy the entire cane crop in one season, and that the Argentine ants, by preserving the scale insects in their nests through the winter, will make eradication of the pest all but impossible. The cotton planters, already battling with the boll weevil and the pink boll worm, are confronted also with this new pest, more destructive than both the others combined.

Owing to the protection given the camphor scale by the ants, this pest can live much farther north than any other of the scale insects, and its spread through the United States can be limited only by the immediate activities of man in combating both it and the carrier ant. Compared with it, all previous insect pests are mere triflers, killing what they eat, and moving slowly, while this Oriental invader kills millions of times the quantity he eats, and has slaves to carry him rapidly to all parts of the country.

Fastest Sprinter the World Has Ever Known

By JOHN B. WALLACE

IN A meet held at Redlands, California, recently, Charles Paddock, a twenty-year-old student at the University of Southern California, performed the remarkable feat of breaking three world records in one afternoon. He ran the 100 meters in ten and two-fifths seconds which is a fifth of a second under the former record. He ran 300 yards in thirty and one-fifth seconds, clipping two-fifths of a second from the mark set by Bernie Wefers. He then continued on to the 300-meter tape running it in thirty-three and four-fifths seconds, far under the old mark of 36 and two-fifths seconds.

These are not all the remarkable performances of this flyer who can be truly called the fastest sprinter the world ever has known. At a track meet held earlier in the spring at Berkeley, California, Paddock ran the 100 yards in nine and three-fifths seconds, equaling the world record, and ran the two hundred and twenty-yard dash in twenty and four-fifths seconds, breaking the world record of 21 and one-fifth seconds for this event.

To prove that this was no fluke, three days later at a track meet held at Stanford University he again ran the hundred yards in nine and three-fifths seconds and ran the two hundred and twenty in 21 seconds flat.

All of the meets in which Paddock made these marks were held under the sanction and auspices of the Amateur Athletic Union with officials, including timers, approved by the union, so there is little doubt but that the records will stand. The tracks had been carefully measured and all the conditions provided for by the union had been observed.

At the Redlands meet the weather was cloudy and rather chilly. There was but little wind and what there was did not favor the runner. The track was surveyed and found to be perfectly level. It was a fast track, of decomposed granite, and was in perfect condition.

The tracks at Berkeley and Stanford were also good, of cinder, and surveyed both as to actual measurement and level. There was little if any wind and what there was did not favor the runner. Perhaps the most remarkable feature about this wonderful sprinter is his consistency. Nearly all great athletes have one day in their lives when they can surpass themselves. But Paddock has three times this spring in competition equaled the world record in the 100-yard dash and broken it in the two hundred and twenty. In view of this fact and taking into consideration his unusual strength and vitality his trainer, Dean B. Cromwell, predicts that Paddock will even better the marks he has made. Cromwell intends to send him against two other world records, the 150 yards and the 200 yards. There is little doubt that he will capture both of these events as his time in the 100 meters and the 220 yards shows that he has already beaten them but had no timers stationed at these marks.

CHARLES PADDOCK,
Holder of five world records in sprints.

Paddock began his career as a sprinter in the Pasadena, California, high school. He won most of his races there and held a high school record of ten seconds in the 100-yard dash. He came honestly by his running ability as his father, C. W. Paddock, was a fast quarter-miler at the University of Michigan.

While Paddock was considered a very fast runner in high school, his real ability did not appear until he came under the expert care of Coach Cromwell at the University of Southern California. Cromwell had already developed at this comparatively small institution three world champions in the sprints and high hurdles and when he got hold of this promising high school boy he clipped a fifth of a second off his record the first season.

Two years ago I first saw Paddock run at Claremont, California, where Pomona College is located. On a heavy track and with a cold wind blowing, Paddock ran the hundred yards in nine and four-fifths seconds and came within one-fifth of a second of the world record in the two hundred and twenty. I had heard of the youthful prodigy and when the runners were lining up for the dash I asked a college student near me which was Paddock. I had some trouble in identifying him and the youth turned to me and said:

"Never mind, you just watch the fellow who is ahead and that will be Paddock."

From that time on Paddock has always been the one ahead, no matter how stiff the competition. The only exception was the 200 meters at the Olympic games in Stockholm last summer and in this race Paddock was not in condition. He won the 100 meters with ease and afterward in Paris cleaned up the best runners in Europe. This year he is at his best and there is reason to believe that the mark of nine and three-fifths in the hundred yards will be finally lowered.

Paddock is a rather stocky youth with a tremendous thigh and a 15¾-inch calf. He would never be picked by the average person as even an ordinary sprinter.

But despite his rather short stature, he is really about average height but looks shorter because of his broad shoulders and muscular development. Paddock has unusually long legs for a person of his height.

In running he breaks practically every known rule for the guidance of sprinters. He has absolutely no form in the meaning of the word as defined by athletic trainers. When running he sprawls all over the track. Instead of running on a line as taught by most coaches he places his feet wide apart in what might be called spraddle fashion.

The secret of his success lies in his tremendous stride and his enormous muscular power. Not a particularly fast starter, when he once gets under way he fairly tears up the track. He has a stride of seven and one-half feet, tremendous for a person of his height and build.

He lifts his feet high in the air, so high that when he broke the records at Redlands he twice hit his chin with his knees. He has a leg drive like a flea.

Paddock does very little training. He does just enough work on the field to keep in condition and most of this work consists of such varied pursuits as putting the shot, hurling the discus and, in fact, everything but jumping which his trainer taboos for fear of injury.

He eats everything but pastry and indulges in no stimulants of any kind, even tea and coffee being under the ban.

Paddock is ambitious to become a newspaperman. He is editor of the college daily and during his spare moments does general reporting for one of the Pasadena daily papers.

There is absolutely no trace of conceit about him. He regards his achievements as just so much good luck in having been given his remarkable body by nature.

Extremes May Meet But Do Not Mate

A FEW years ago, the newspapers carried an account of an epidemic of suicides among the higher-class young men of a southern French city. An English musical comedy had come to town whose chorus consisted of golden-haired goddesses whose ravishing beauty played such havoc with the hearts of the local young men that the unrequited adoration in the case of five of them found solace only in death. The press story accounted for the tragic circumstances by the theory that blonde hair, blue eyes, and very fair skins were rare in the southern locality and that these exotic charms would inevitably possess a fatal fascination for the temperamental Romeos exposed to them because the latter were dark-haired, black-eyed and olive-complexioned.

Popular opinion assumes this supposed attraction between opposites to be universally operative. The light-haired, blue-eyed young man should marry a brunette, so he thinks, and the wistful black-eyed maiden imagines that she will realize her supreme happiness in finding her mate in a tall, masterful blonde.

A Swiss scientist, Dr. Herman Fol, of Geneva, has published in the *Revue Scientifique* the results of an investigation which he conducted with reference to this subject. Dr. Fol made a collection of the photographs of 251 couples which he separated into two lots, the first of which comprised pictures of young couples and newlyweds, 198 in all; and the second of which contained the photographs of 53 old couples. He classified each of these lots according to the resemblance between husband and wife as "very great," "medium" or "dubious." The following table indicates the results of his analysis:

	Resemblance Very Great	Moderate Resemblance	Dubious or no Resemblance
Young couples	27.3%	39.4%	33.3%
Old couples	24.5%	47.2%	28.3%

According to the law of chance, only 2% of the cases would exhibit resemblance. If the money-motive predominated that percentage would be the same as if there were random mating. Yet as a matter of fact, we find that two-thirds of the young couples (66%) show appreciable resemblance in looks as do also 71% of the old couples.

There is a popular belief that long years of living together as husband and wife makes old couples look alike. The above table indicates that the reason they look alike in old age is because they resembled each other when they were married.

Dr. Fol therefore concludes: First, that couples unite in accordance with conformities and not in accordance with contrasts; second, that the resemblance between old married people is not a state acquired in consequence of conjugal life.

Let it be admitted that blue eyes do attract the brown, that raven tresses are adored by the blonde-headed; that our youthful love affairs are often with opposites. But temporary infatuation and marriage are two different things. When people get ready to settle down, they seek not alluring differences in their mate; they want to cast their lot with one who looks on life as they do, who shares the same ideals, education, purposes and tastes, one who is congenial, not merely interesting or stimulating. If Dr. Fol is right, the resemblance is not merely confined to a community of mental interest; it is paralleled by physiognomical similarity so that people may be temporarily attracted by their opposites but they usually marry their likes.

A Government Official Who Is Different

THE new Republican administration at Washington is all agog over the discovery of an exceedingly rare man among government employes. He is an official who actually does the unheard-of thing of reducing the number of employes in his department while the quantity and quality of the work steadily increase.

This is such an unusual event in the government service that it is attracting wide attention.

The name of this chap is Henry Clay Neal. He is a native of Lexington, Kentucky. Neal has the distinction of having charge of the largest filing system in the world. He is officially known as the "Chief of Files" of the Income Tax Unit of the Internal Revenue Department of the United States Government. In the files under his jurisdiction are located more than 17,000,000 income tax returns and 28,000,000 letters which have a bearing on income tax affairs.

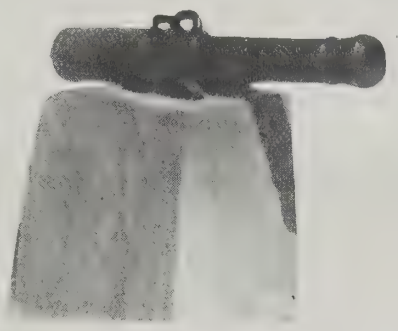
When Neal took over this colossal job several years ago he found 900 employes. Their work was 65 per cent efficient. Today there are only 288 employes and their work ranges from 98 to 99 per cent in efficiency. Bear in mind that while this great reduction in employes and increase in efficiency were going on, the number of returns and letters in the files were increasing at the rate of 3,000,000 a year.

HENRY CLAY NEAL

This job of Neal's is not only big in size, but it entails a degree of secrecy second to none in Uncle Sam's governmental establishment. He is familiar with the incomes of every individual and corporation in America subject to the payment of income tax. But when it comes to talking about the contents of his precious files, Neal makes the clam family seem like a busy boiler shop in comparison.

Meeting Neal in his official capacity in the beautiful Treasury Annex, located within the shadow of the White House, one is surprised at the ease with which he handles this stupendous task. Any one of the 45,000,000 documents in his files can be produced within an average of one minute after it is called for. There's real honest-to-goodness efficiency for you!

When asked how he obtained these satisfactory results, he briefly replied: "By organization and systematization. The results are a maximum of production at a minimum of expenditure. I make it a point to let each clerk under my supervision realize that he is a part of the organization and that his services are appreciated. The door to my office is always wide open to receive any complaint from my force. The zeal with which the employes dispatch their duties is brought about by making them feel at all times that they are an integral and important part of the organization."



Marines, as Missionaries, Do Much for Hayti

By WILBUR FORREST

UNITED STATES Marines who, according to popular conception, normally live aboard battleships and dash ashore, rifles in hand, when occasion demands it in any part of the world, are today engaged in a unique land operation.

Down in the little West Indian Republic of Hayti, where political considerations, a war of pacification and other things served to draw the attention of the public to the fact that the United States has a real problem in the Caribbean, we find American Marines today as far away from their battleships as island geography will permit and as alien to popular home conception as Marines could possibly be.

The United States Army has usually drawn the lot of benevolent administration on a grand scale in American protectorates and possessions variously scattered. It was the Army in Cuba, the Philippines, in Porto Rico and elsewhere. America's idea of her Marine is that of a "devil-dog" fighter; a sort of rough and tumble individual good for stern and quick work; an undiplomatic though virile youngster ordered from his battleship hammock to go ashore and pacify and one who is not so particular how he pacifies just so there is pacification.

British gun mounted by Americans at Petit Goave outside Gendarmerie Headquarters, brought here by the French over 125 years ago.

Benevolence, tact and diplomacy are alien to America's conception of men who fought in the Boxer uprising in China, landed at Vera Cruz and among other affairs gathered a certain reputation during the late unpleasantness in France. But if we may come down to the present, American Marines, having finished their work of pacification, are doing real missionary work in the primitive little "Black Republic" which boasts ten thousand square miles and two million inhabitants. This work is not the missionary labor of Bible classes but an endeavor toward Haytian humanity which, as strange as it may seem, promises to do more toward Hayti's and all Latin-America's estimate of America's good intentions toward little protectorates than any other agency.

The missionary unit of the United States Marine Corps in Hayti is called the Gendarmerie d'Haiti, a military organization officered by Marines and composed of native rank and file. This native army is commanded by Lieutenant-Colonel Frederic M. Wise, whose record in France is the "devil-dog" variety, but whose alien work in Hayti today is rapidly stamping him as a Marine who knows benevolent administration among a simple, almost helpless people as well as he knows the sterner game of fighting.

Cubans still revere Major General Leonard Wood of the Army for the firm though scrupulously just hand which he constantly held on the Cuban helm many years ago. Haytians, who do not love the United States for our slipshod administration policy in their little republic during the past five years, are beginning to recognize the firmness and fairness of Wise, the unique Marine, who has been among them for two years.

General Wise, as he is ranked in the Gendarmerie service, believes that Marines have functions other than fighting; that of administering, for one, even if it requires tact to accomplish the latter. His assistant general is Richard Hooker—lieutenant-colonel of Marines—a "devil-dog" of long standing reputation.

In naval parlance which these Haytian-Marine generals are apt to use in conversation, the Gendarmerie d'Haiti polices Hayti from bow to aft. There are some twenty-seven hundred officers and men in the organization, controlling the two departments of the republic, the North and South. Each department is commanded by a colonel of Gendarmerie and three so-called divisions are commanded each by a major. One of these majors alone commands or administers more than fourteen hundred square miles with a parcel of white subordinate officers and black troops who not only preserve the peace but preserve native good will as well.

The black rank and file of the Gendarmerie receive ten dollars a month as pay and fifteen cents per day for rations. They can live on less. The annual clothing allowance is less than forty-five dollars, an allowance, incidentally, which permits them to appear universally spic and span in a uniform and with personal equipment not far different from that of the Marine ranker of lighter complexion.

British success with black troops in Africa is being repeated in America's unique experiment in Hayti, according to the white officers of the Gendarmerie. The blacks naturally lack certain soldierly virtues of whites but they are faithful to the trust and amenable to perfect discipline. Standing ever behind the Gendarmerie in its function of policing is the wholly white First Marine Brigade from which the white "missionary" officers of the native organization have been drawn.

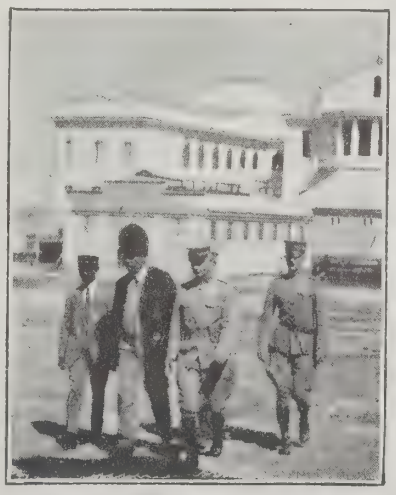
To see the best results attained by these Marine missionaries, however, it is necessary to leave Port au Prince, the Haytian capital and travel into remote and isolated parts of the bush. You may ride, for example, for ten or twelve hours from the nearest sizable town over mountains into valleys and across plains to get to the village of Hinche, a community in the heart of the bush which not so long ago was a hotbed of bandit warfare.

Hinche has a church, a couple of schools and a prison. Whites are responsible for all. Otherwise the village is a conglomeration of native huts with thatched roofs and dirt floors. And Hinche is far above the average as Haytian bush villages go. Its schools are a novelty, its churches a God-send and its prison, figuratively speaking, a "college" where native malefactors are treated with goodly consideration and taught useful artisanship which follows them back to freedom. This is Hinche today. Hinche yesterday was not a rosy picture. Marines and Gendarmes alike held out here about a year ago with rifles ever ready to repulse bandit attacks and patrols were daily and nightly forging off into the dreary country in search of organized bands of vicious black men who were capable of barbaric and terrible deeds. Entire native villages were burned and whole families murdered by these bandits. Dreadful evidences of cannibalistic bandit orgies were found on various occasions. Fighting such foes was not a gentle task. Marines and Gendarmes stationed in the district of Hinche not only fought them but preserved the village as the main asylum for bush natives who fled into it for protection. Now, however, the district is at peace as are all other similar districts over the length and breadth of the republic.

It was at Hinche that I found two missionaries, one of them a Marine and the other a co-worker who was somewhat typical of other co-workers in the Haytian country.

The Marine was Lieutenant M. J. Perry, of Oakland, California, and the other was Abbe Belloit, long ago of St. Nazaire, France. One was the pacific administrator of the village and the other his chief aid and companion, both working in such isolation that they had good reason to believe—under ordinary circumstances—that their work would never be known to an outside world.

We were sitting at supper over a rough table in a little hut one evening in Hinche when Lieutenant Perry remarked:



"It's about time for the Pere to be showing up."

Lieutenant Frank H. Mason, of Boston, a Gendarmerie doctor on temporary station, mentioned that the Pere was overdue. Mason had been with Perry but a few weeks. The latter, however, knew that if Abbe Belloit failed to put his head in at the door before the coffee was served that something was wrong.

"You see," explained Perry, "the Pere has not missed a night here for years. He likes to come and drink coffee and talk. He looks forward to his evening chat and is as regular here as he is at the church at four a. m. to hold early mass for his native converts."

Presently the Pere shuffled in. His grizzly hair rioted out from under a little cap and his lean figure was draped in a rusty black robe which ended just above the coarse nether ends of rough khaki trousers and heavy shoes. Unskilled and obviously masculine darning with heavy thread on the robe told its age and the penurious economy of an ecclesiast who had elected to live his religion. But the garb did not detract for an instant from the seamed face which appeared that of a man of fifty but which I later learned should have been the countenance of one only thirty-six. The figure that stood in the doorway looked every day of fifty.

For thirteen years the Abbe Belloit has lived and worked in and around the almost inaccessible village of Hinche, eight years of this the only white man among the blackest and most illiterate body of blacks this side of Equatorial Africa. Voodoo orgies with their terrors of human sacrifice were performed in the hills around him. Often bush bandits murdered or robbed the natives but except for one occasion never molested the village church. Here in this lonesomeness the old-young Abbe from France mastered the Creole tongue of the blacks, attempting always to convert them to his own religion. With his own hands he made the repairs always necessary on the rickety church and during periods of nonministration to his adopted charges he gathered big stones for the foundation of a parish house. Then he cut down mahogany trees in the near-by forest and hewed timbers for the structure. The house erected, he enclosed it in a fence of logwood, a precious wood from which basic vegetable dyes are made, but like the mahogany a worthless market product in the railroadless, roadless Haytian bush.

President Darteguenave, accompanied by Marine officers coming to testify before Naval Board of Inquiry in Barracks.

For eight ascetic, solitary years, during which he never saw the countenance of another white man, the Abbe slaved with his people and his bush institutions, bringing learning and education to the natives. He educated native girls for teachers and built two rude schoolhouses—one for boys and one for girls after the French fashion—and he admitted as we talked over the crude supper table in Hinche not long ago that it is only the deepest and firmest convictions of a white man's chosen religion that will prompt him to do such things.

But to get back to Hinche which must serve as the main example of the unique Marine policy of missioning. We find around the supper table in Lieutenant Perry's little hut each night not always only the famous Abbe but the colored notables of the town who are proud to be good friends of the young officer. Perry's name in Hinche stands for honesty and justice. Some years ago he was delegated by orders to come into the district and hunt bandits and he did the job with thoroughness. Now that peace is supreme in Hayti, he is the fast friend and co-operator of the village functionaries, a firm supporter of Abbe Belloit's system of spiritual uplift and godfather to some scores of little black "picks" who will grow up with a certain respect for the pacific intentions of the United States toward Hayti.

During recent and extensive ramblings over the little "Black Republic," the writer found these Marine missionaries in communities large and small; in posts smaller than Hinche and in cities and towns which boasted communication with the seacoast by road. They seemed to have caught the spirit of co-operation and uplift rather than that of force and bullying which usually fails to gain the respect of any people, illiterate or otherwise.

Before United States Marines landed in Hayti in 1915, native prisons were terrible holes. Haytian prisoners have been cleaned up by the Americans. Today they are models of cleanliness—light and sanitary. Inmates are fed perhaps better than their normal life provides and are often reluctant to accept liberty when sentences expire. They are taught useful trades and the importance of industry, to make them better citizens.

During five years of American occupation in the "Black Republic" there has been constant life-saving sanitation and road building and, as mentioned in a previous article, the greatest task of all, that of pacification in a territory which has known only strife for generations. Without peace the new mode of missionary work here described would be an utter impossibility.

The main work of regeneration began with the death of banditry more than a year ago.

Benoit Batreville was the last insurrectionist leader in Hayti. He was the "Villa" of the Caribbean republic. When a Marine bullet pierced Benoit during a mountain fight last April, banditry ceased completely. This Benoit Batreville served as the most formidable adversary of American pacification work since Charlemagne Peralte. The story of Charlemagne's death when two Gendarmerie officers penetrated six mountain outposts into the bandit chief's camp and "nailed" him there was announced by the Navy Department in Washington.

The story of Benoit Batreville's end is little known in the United States. Benoit, like Charlemagne, was a so-called intellectual, leading a band which was capable of terrible deeds. His "army" made an audacious attack on Port au Prince, the capital, a year ago last February and was repulsed with considerable loss. The next definite information about the mulatto chieftain's movements was that he had grouped about him one hundred and fifty very bad blacks, the pick of his entire force, and was more than ever on the warpath.

Last April, a Gendarmerie patrol was ambushed by Benoit's band and Lieutenant Muth, the leader, was wounded and captured. His body was found mutilated, giving evidence that Muth had been tortured before death. Charges of cannibalism against the bandits were not based on imagination.

Both Marine and Gendarmerie patrols redoubled their efforts to catch Benoit. Captain Becker, leading a Gendarme patrol, was the first to encounter him but as usual, the wily outlaw escaped after injuring Becker. The mulatto chief placed a whistle to his lips, blew several sharp blasts and fled into the mountain thickets followed by his band. The whistle was similar in tone to those used by officers of the Gendarmerie and Becker assumed that Benoit had taken it from the body of Lieutenant Muth.

The day after Becker's encounter, two patrols, one led by Captain Perkins, of the Marines, and another composing Becker's faithful Gendarmes—not more than 20 men in both patrols—came upon Benoit's band. The forces came into action in a gully. Perkins was fired on by a man who came bravely into the open. The American officer dropped to the ground and returned the fire. When the duel ended the enemy was dead and Perkins continued in the general fight. Finally, when the blacks had been routed Perkins returned to the gully to examine the victim of the duel. It was Benoit Batreville. The whistle he had taken from the body of Muth was found and identified and the unfortunate officer's automatic pistol and other possessions were found on the bandit's corpse.

During the political campaign in the United States last year, charges were made that Marines in Hayti had been guilty of the "indiscriminate killings" of Haytian natives. A Naval Board of Inquiry sought the facts and returned from Port au Prince to Washington where findings were made absolving the Marines of guilt.

The writer's investigations in Hayti would not have justified such a broad finding as that rendered by the Naval Board of Inquiry. Undoubtedly there have been cases of "indiscriminate killings" of Haytian natives But there have been extenuating circumstances. Considerable resentment is found among Marines that political charges of "indiscriminate" slaying should have been linked with a figure of about twenty-two hundred natives, who by inference appeared to have been law-abiding Haytian non-combatants. The great bulk of this figure represented lawless bandits in open warfare.

But the American political campaign is over. Hayti is enjoying the most profound peace in decades. The new Marine policy seems to be getting results.

Temple Block, Salt Lake City. Showing the Great Temple of solid granite, the domed Tabernacle, the Assembly Hall in the left background. The lower buildings just inside the wall are occupied by the Bureau of Information.

Mormon Temporalities

By DR. JAMES E. TALMAGE

Of the Council of the Twelve, Church of Jesus Christ of Latter-day Saints.

YES, of course, the Mormon church is in business, and big business at that. Not alone in Salt Lake City, which is the seat of the presiding councils of the church, but in every city, town, and village wherein a Mormon community dwells there is outward and visible demonstration of church activity in material affairs.

The present nation-wide depression in building operations and in business generally is evident in the "valleys of the mountains," though less markedly than elsewhere. Chapels, tabernacles, amusement halls, and one temple are in course of erection; and plans for further construction of the kind, now under examination in the office of the church supervisor of buildings, approximate six millions of dollars in estimated cost.

Brief mention of the general plan of church operation may be in place. Territorially the church comprises missions and stakes. Where the Latter-day Saints have gathered in sufficient numbers, as in Utah, Idaho, Oregon, Wyoming, Colorado, New Mexico, Nevada, Arizona, Alberta (Canada) and Mexico, they are organized into Stakes of Zion; while the rest of the United States and other countries are districted into distinct missions. A mission comprises conferences, and these are subdivided into branches. Stakes are segregated into wards and branches, and of these subdivisions nearly a thousand have already been organized.

The ward is the territorial and community unit within the stake. At its head stands the bishopric, comprising a bishop and two other high priests known as the bishop's counselors. In lower order of authority are "quorums" of priests, teachers and deacons; and, as helps in government, the several auxiliary organizations are indispensable factors. These latter comprise the Relief Society, which is composed entirely of women; the Sunday school; separate institutions known as the Young Men's and the Young Ladies' Mutual Improvement Associations; the Primary Association for children; and the Religion Classes, which supplement the secular instruction of the public schools by lessons in morals, theology and religion.

This fragment of the elaborate and efficacious plan of church organization should be considered if Mormon activities are to be rightly understood.

From the establishment of Mormondom in the West, dating from the settlement of the pioneers in Salt Lake valley in 1847, the ward has been the social center of the people. Its building equipment has advanced from the single-room meetinghouse of the early days—usually constructed of logs or adobe—to the modern chapel of pressed brick or hewn stone, beautiful in architecture, with auditorium, vestry and numerous classrooms; and the adjoining amusement hall. Only religious services or class exercises closely related thereto are conducted in the chapel; all recreational activities of indoor character are provided for in the amusement hall. Attention is given to training in music, social dancing, dramatics, debating, forum work and pageantry; and in these as in Scouting for the young men, and "Beehive" work for the girls, systematic courses are conducted. The motion picture is a feature of ward recreation; and an effective censorship of subjects is exercised, whereby the films exhibited in the social centers are such as conform as nearly as possible to the church standard of morals.

It should be added that the church engages in no recreational work for profit, its sole purpose being to provide wholesome entertainment at cost; though "benefit" performances or exhibitions are allowed, the proceeds from which are applied to some local need, such as additional equipment, renovation of the amusement hall, beautifying of the grounds, and the like.

For stake assemblies commodious tabernacles have been erected; and for greater gatherings, as those of the general conferences of the church, the great Tabernacle in Salt Lake City is used.

By architects and others the Salt Lake Tabernacle has been pronounced one of the most remarkable auditoriums ever constructed. Its structural plan is simple, comprising essentially a great dome supported by buttressed walls. It was in course of erection from July, 1864 to October, 1867. The building is 250 feet long, and 150 feet in greatest width. From floor to ceiling at the middle the distance is 70 feet; and the network of beams and trusses between ceiling and roof is 10 feet high. The immense dome-roof is of lattice construction and is self-sustaining, there being not so much as a single supporting pillar. More remarkable still, the roof is built entirely of wood and was originally constructed without nails or metal spikes. The enormous beams and trusses were held together by wooden pegs and rawhide thongs. While the Tabernacle was in course of building, iron nails and spikes were obtainable only as they were brought across the plains by wagon and team, and the high cost prevented their use.

Many modern buildings present larger roof-spans, but such are generally constructed of metal. A capacious gallery, 30 feet wide, extends along the inner walls and is broken at the west end only, where it gives place to the grand organ and the seats reserved for the great choir. In contrast with the usual methods of construction this enormous gallery is not continuous with the walls. At intervals of twelve to fifteen feet great beams connect the gallery with the wall buttresses, but between these beams the gallery is set forward two and one-half feet from the inside of the walls, and the open spaces are guarded by a high railing. It is believed that the surprising acoustic properties of the building are due in part to this feature of construction. The great dome is, in fact, a colossal whispering gallery, as the multitudes of visitors who have inspected the building know. When it is emptied save for the few, the fall of a pin dropped at the focal point of the ellipse near one end of the building may be heard at the corresponding point near the other end. The convenient seating capacity of the tabernacle, including the gallery, is nearly nine thousand, though, under conditions of crowding, congregations much larger than this have assembled beneath the dome.

No mention of Mormon buildings would be even half-way complete without reference to the temples, which are uniquely characteristic of this peculiar people. Of the four temples now standing in Utah, that at Salt Lake City was the first begun and the last completed. This splendid structure was forty years in building. The walls are of solid granite eight feet thick in the first story and six feet in the upper part. It is of a style peculiar to itself, not inaptly called "Mormonesque." Many stones of emblematical significance appear, representing sun, moon, stars, the earth and the clouds. On the main inscription stone at the east we read: "Holiness to the Lord," and on the keystones of the arched windows at both east and west ends, "I am Alpha and Omega," and above these is the awe-inspiring emblem of the All-seeing Eye.

The Latter-day Saints have recently completed a temple at Laie, Hawaiian Islands, and another is nearing completion at Cardston, Alberta, Canada. To the Mormons a temple is more than chapel, tabernacle, synagogue or cathedral. Temples are erected and maintained for the solemnization of sacred ordinances, and not as places for general assembly or for ordinary congregational worship.

Another Mormon structure of imposing proportions and striking architectural design bears over its main entrance the unpretentious inscription "L. D. S. Church Offices." Though but about five years old, it is known far and wide. It is essentially a steel structure faced with thick granite, but with foundation benches and supporting columns of solid stone. Within, the ground story and the next above are finished for the main part in highly polished aragonite, which is known in the trade as Utah onyx. This building constitutes the administrative headquarters of the church. It contains the offices and council rooms of the first presidency, the Council of the Twelve Apostles, the First Council of the Seventy, and other presiding authorities. One entire floor is devoted to the work of the church historian; and the greater part of another is given up to genealogical research, which, owing to the practice of vicarious ordinance work for the dead, ranks among the very prominent features of Mormon achievement. The administration of such ordinances in behalf of the departed is carried on in the temples only; and the compilation of accurate genealogical records is a prerequisite thereto.

The church has spent and is spending large sums for the erection and maintenance of hospitals. The

THE DEARBORN INDEPENDENT asked Dr. Talmage to prepare several articles on the activities of the Mormon church. As stated elsewhere, Dr. Talmage is a member of the Council of Twelve, but this fact must not be accepted as indicative of a desire either on the part of Dr. Talmage or this paper to publish anything which may be regarded as of a propaganda nature. Not alone is Dr. Talmage high in the councils of the church, but he is a Fellow of the Royal Society of Edinburgh, of which there are only seven members who are Americans. He is the only American holding life membership. As one of the "Twelve Apostles" of the church he attended the Third World's Christian Citizenship Conference in Pittsburgh, in November, 1919, at which time there was a discussion of Mormonism.

L. D. S. Groves Hospital in Salt Lake City is one of the best equipped institutions of the kind in the West; and the Dee Hospital in Ogden, though smaller, is likewise thoroughly up-to-date. The church has under construction another large and strictly modern hospital at Idaho Falls, Idaho.

Building, however, is but one of the many material activities with which the church is occupied. The beginning of irrigation by white men in the West dates from the day on which the pioneer band, under the direction of its intrepid leader, Brigham Young, entered the valley of the Great Salt Lake; and this enterprise—which is veritably the magic touch at whose response the desert has yielded its treasures for the sustenance of man—has been especially fostered by the church from the beginning. In the early days the construction of irrigation canals was largely a church undertaking. More recently great irrigation projects have been successfully carried through by private capital; and the National Reclamation Service has co-operated in the construction of dams, canals, and reservoirs on a scale which by comparison is colossal.

It is but a statement of simple truth to say that the church has been ever active in the support of home industry and in lending financial aid to any legitimate undertaking intended for the development and welfare of its people, and for the good of the state without regard to the religious affiliation of its citizens. It has always led in the introduction and establishment of enterprises that promised to be beneficial and helpful to the community. The church rendered substantial service in early railroad construction, by which the isolated oasis was brought into close communication with both East and West; it contributed to the establishment of the telegraph and the telephone; it was among the first movers in developing water power for electrical energy; it was instrumental in the establishment of the beet-sugar industry in the intermountain realm; it has devoted large sums of money to colonization and to the necessary irrigation enterprises connected therewith. It has rendered substantial financial assistance in the establishment of woolen mills, salt plants, stone quarries, brickyards, cement factories, coal fields, sulphur fields, iron and steel plants, elevators, flour mills, and a number of other smaller industries.

In these and other related activities the church has spent millions of dollars, not for profit to itself nor for the monopolization of industry, but primarily to furnish employment and insure prosperity to the community. Nevertheless, some of these enterprises have brought good returns to the church as an organization, while in others losses have been incurred; but it reckons its profit in terms of community prosperity and in the individual welfare of its members.

It is interesting to note that of the families of the church living in the organized stakes, over 75 per cent own their homes. There is little employment for the rent-collector except in the larger centers of population, and even there, most of the church members who pay rent are those who live in furnished suites by choice.

A good Mormon regards efficiency in what we are apt to call worldly affairs as a requirement of his religion. He devotes a fair and equitable part of his time to the contemplation of what lies beyond the grave, and conscientiously gives due attention to the practical activities of mortality. It is his bounden duty to contribute his full share of labor and time to everyday work, whether his vocation be that of the farmer directly delving into the soil, of the artisan, the clerk, the banker or the professional man. Temporal salvation, which is attainable through honesty, thrift, and hard work, plays an important part in individual preparation for the spiritual salvation of the hereafter.

So the church collectively and its members severally are in business, with such determination and thoroughness as shall insure success in all righteous dealings for betterment and prosperity here, and for the training and experiences that such labor shall afford in preparation for the life to come.

Deseret, the beehive, is the Mormon emblem of industry.

Preacher-Writer-Fighter Now Industrial Arbiter

Concluded from page 3

took occasion to express strong disapproval of hasty action on the part of the workers in contravention of the terms of an existing agreement. In this particular case the council was able to prevent the disruption of a very important service to the business community of the province, saving a vast amount of annoyance as well as serious loss to shippers and to consumers.

Supreme Importance of Continuing at Work.

Possibly the most important and the most interesting case during the year was that which involved workers upon the big mail order building of the T. Eaton Company and in this case particularly the Joint Council of Industry succeeded in impressing on all parties that it is of supreme importance that industry should be continuous and that interruptions should be avoided. The motto insisted upon was, "Get on with the Work."

In the case of the Eaton mail order building the claim was made that, in contravention of recognized and fundamental Trade Union principles and in contravention of an agreement entered into between the General Contractors' section of the Winnipeg Builders' Exchange and the Building Trades Council, non-union workers had been introduced by the Vulcan Iron Works to complete a sub-contract which they had taken from the contractors, P. Lyall Construction Company, Limited. As can readily be understood, deep feeling of indignation was aroused among the workers. A resolution to strike was carried and, in fact, a mandate for the strike was issued. None of the parties to the dispute had suggested appealing to the Joint Council of Industry but the council stepped in and invited the parties to a conference. As before stated, the council succeeded in impressing upon all parties that the matter of supreme importance was to get the work on the building completed without loss of time. It was able to persuade all parties that this was not the most appropriate time nor the most suitable method for the settlement of a fundamental economic principle and that all parties should unite in seeking a *modus laborandi*—a method of getting on with the work. After negotiations carried on in an atmosphere of reasonable and fair-minded conciliation, the proposed strike was called off and the work was continued without cessation of a single day. In this case some five or six hundred workers were involved and financial interests to the amount of several hundreds of thousands of dollars. It is impossible to estimate the amount of loss a few weeks' strike here would have entailed nor to what extent the strike might have spread. It is important and interesting to notice that the very fact that the council was in existence offering an opportunity and place for discussion in an atmosphere of amicable interchange of opinion did much to prevent acrimonious and bitter feeling and render settlement easy. The fundamental principle at issue in this case still remains unsettled but in the meantime the work has been carried on to completion.

Sacredness of Agreements.

The council has persistently and consistently asserted the binding character of agreements and the necessity of maintaining contracts unbroken even at the cost of inconvenience and loss. For example there was the case of the Bricklayers' International Union and the contractors on a government building at Portage la Prairie. It was claimed by the union that a clause in the agreement between the Winnipeg Business Exchange and the union covering work carried on outside of the city of Winnipeg had been violated by the contractor in engaging bricklayers on terms other than those laid down in the agreement. After conference with both parties the council was able to show that the agreement had been violated and the contractor immediately expressed his willingness to alter the arrangements he had made and to make them harmonize with the terms of the agreement under which the work should be carried on. Here again, the advice of the council saved the cessation of work upon a very important public building and also saved the loss of wages to men at a time when there was much unemployment. It also saved loss to the contractor which would have resulted from the hindering of the completion of the building within his contract time limit.

Public Utilities.

The council during the year had a number of cases involving employes working on public utilities. Without going into the details of these it may be mentioned that in the most important the council insisted that the main consideration in the whole controversy was the interest of the community and the securing of the best and cheapest services to the community, thus enabling the parties in the case to preserve a due sense of proportion and making it easier for them to come together. As a matter of fact, the council was able in this case, which involved the International Brotherhood of Electrical Workers and the Manitoba Government Telephone Commission, to bring about an agreement as to principle after which the two parties agreed to settle minor details in mutual conference.

In commenting particularly upon the cases involving public utilities, Dr. Gordon suggests that the council has been able to exert this composing influence because the council is supposed to be, and in fact is, representative of the whole community and not of any section of it, and incidentally because of the very happy fact that all members of the council have been able to arrive at a unanimous decision in every case. He observes that the services rendered by the gentlemen who represent the two main elements in the industrial life of the community have been distinguished by ability, fair-mindedness and a devotion to duty that must have involved in many cases a sacrifice of personal interest.

Manitoba's experiment with the Joint Council of Industry is being watched by all of the other Canadian provinces and by a number of the states south of the "invisible line." This is proved by many official inquiries and requests for copies of the bill which brought the council into being. Manitobans who followed the bill through the legislature and have studied its application in the workings of the council in the past year noted with special interest the fact that a similar idea has come from the fertile brain of one of the greatest of living Britishers, Premier Jan Christian Smuts, of South Africa. It will be remembered that in outlining the policy on which the Smuts Government appealed to the people of the great British dominion in South Africa last year, he put first "the securing of industrial peace by the establishment of a Joint Council of Industry." The chances are that Premier Smuts never heard of Manitoba's Joint Council of Industry but in any event the honor of having been first must remain with Manitoba.

Briefly Told

More than three million men are under arms in Europe at this time.

The fez is no longer to be the national headdress of the Turk, according to a decision of the national assembly. The "kalpak" will be substituted. The "kalpak" is made of black cloth or felting somewhat similar to the fez only flatter and broader.

An aviators' special weather report will be sent out each day by naval radio, beginning June 1. In co-operation with the weather bureau the Navy Department will send broadcast from the Arlington station at 10 a. m. a report giving data from forty-four towns and cities. Wind direction and velocity for various levels of aerial travel will be included in the report.

The Knights of Columbus are planning to purchase twenty-six hundred acres at Nassau, Bahama Islands, which includes the authentic landing place of Christopher Columbus, the patron saint of the order. The estate will be maintained in perpetuity by the New York State Council of the order.

Papering the walls with Austrian bank notes has proved such a good advertisement that several innkeepers have taken up the idea in Geneva. The cost is but little more than that of good wallpaper.

An aluminum bearing deposit, believed to contain one hundred and fifty million tons of aluminum, has been discovered near Tapoleza, Hungary. This is one of the largest deposits in existence.

An airplane, acting as a cable layer, laid and put into service a six-mile stretch of land telegraph cable in eight minutes in Sweden. Six minutes were spent in flight and the other two in making connections.

French scientists who experiment with radium are using gloves lined with lead. Wooden tables lined with lead save the legs of the experimenters and the rest of the body is protected by thin metallic sheets.

It is illegal for any person, firm, company or corporation engaged in business within the jurisdiction of the Philippine Islands to keep books of account in any language other than English, Spanish or a native dialect.

Federal prohibition agents are directing their attention to druggists who are profiteering on whisky sold for medical purposes. Liquor bought on prescriptions for sick people have in some instances been found to have been adulterated with prune juice and water and sold at the price charged for pure liquor.

A Japanese representative has introduced a prohibition bill at nineteen consecutive sessions of the Diet.

French and Polish engineers, under supervision of the two governments, are seeking to recover a wealth of gold and silver reported to have been hidden from the enemy by French soldiers in a lake near Vilna during Napoleon's retreat from Russia in 1812. Estimates of the value run from twenty-five to thirty million dollars.

Grasshoppers are an excellent food for live stock, according to the findings of a commission appointed by the government of Uruguay. When dried, an analysis of the product showed a fatty matter content of forty per cent and more than this amount of digestible protein. The product is superior to oil cake and horses, sheep and pigs eat the dried locusts readily.

Lightning struck a barbed wire fence near Laramore, Colorado, killing fourteen valuable cows along the line of the fence.

In an attempt to reduce the toll of fatal accidents throughout Seattle, the coroner is erecting signs at places where fatalities have occurred, stating in detail the particular fatality responsible for the sign.

Germany is making synthetic gasoline from brown coal-tar.

Four women, arrested in Chicago for stealing from department stores, were sentenced to go to church every Sunday for a year. They must be home at 10 o'clock every night and wash and dry the dishes every day.

A wreath bearing the inscription: "A small tribute from those in trouble in whom Justice Ashley M. Gould consistently displayed a just and helpful interest," was placed on the coffin of the late justice of the supreme court of the District of Columbia as a tribute from prisoners of the district, most of whom were sentenced by Judge Gould.

Priceless historical documents stored in the Castle of Simancas, near Valladolid, Spain, are placed in peril, due to the neglect of government officials to keep the building in proper repair. Thirty-three million documents, comprising the archives of Spain, many of them preserved since the days of Cardinal Ximenez, are in danger.

Ninety-three per cent of the people in fifteen cities in Japan favor an arrangement looking to disarmament by international concerted action, according to a canvass, made by the Japanese anti-militarist leaders.

The productivity of the banana is much greater than that of other food-bearing plants. One acre, under scientific cultivation, will annually produce seventeen thousand pounds of bananas. There are over sixty known varieties of the banana, with a great variation in character.

Save Your Snaps

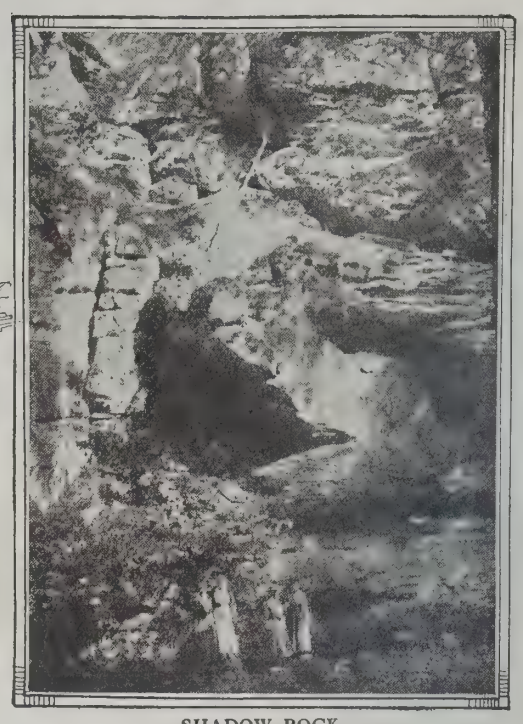
By M. E. DIEMER

Director, University of Wisconsin Photographic Laboratory



Transcribed by Wyman Smith

Hints for the amateur photographer which will help him make better pictures by improving composition and answering such questions as:

Which way should the shadows fall?

What is the best framing for a photo?

Where should the objects be placed?

SHADOW ROCK

While the persons are out of place the picture is redeemed by the line of beauty carried upward by spots of sunlight. Grouping is good but cutting off the upper part of the picture makes it only a "snap."

HOW many times have you exclaimed, "What a charming spot!"

How often have you rushed forward to take a picture of the delightful scene?

And later how many times have you developed and finished your films and pictures, only to find that everything is merely a horrible mess?

Do not immediately blame the camera, put it in your pocket and set out for the nearest exchange to purchase a new one with a better lens; nor resignedly accept poor pictures and believe that only a photographic artist can do really good work; for many times the fault lies not in the camera but in its use and understanding.

We can't make every picture artistic, but we can make it satisfying by remembering just a few of the little tricks which every good photographer has grown to use almost unconsciously. Hurry spoils more pictures than any other one thing, and many a man has had to wait for hours to obtain just the proper light, the correct clouds, or he may have waited for the wind to die down enough to prevent the movement of a leaf which might spoil the effect of beauty.

All that is beautiful does not photograph as a model of beauty, for color is too often deceptive. Color really has very little to do with making a good picture for when the reproduction can be made in only brown and white or black and white only two things have remained— mass and position of the mass. Pictures to be good must be simple—the shape of a tree, a bush, the direction of the sunlight or of the water in a river or the waves upon the lake shore alter the appearance of many a print. A scene spread out in all its glory before the eyes may be filled with charm and beauty; it may be enough to inspire poetry or to preach a sermon; yet the camera may do its most artistic work if confined to one corner or one little nook of the beauty spot. Such apparently insignificant objects as an old fence or a heap of stones give beautiful impressions if they are spotted with light and shadow and introduce the eye to something else farther into the scene.

But what of the camera?

One thing only need be remembered after one has learned to give it the proper time—it has only one eye while the person who is using it looks at the scene with two, and while the camera is in use its one eye is often two feet below the two eyes of the photographer. One eye does not possess the wide range of vision given the two nor does it show the objects so clearly or of the same size and position and it must, therefore, be accommodated by using the mechanism of the shutter.

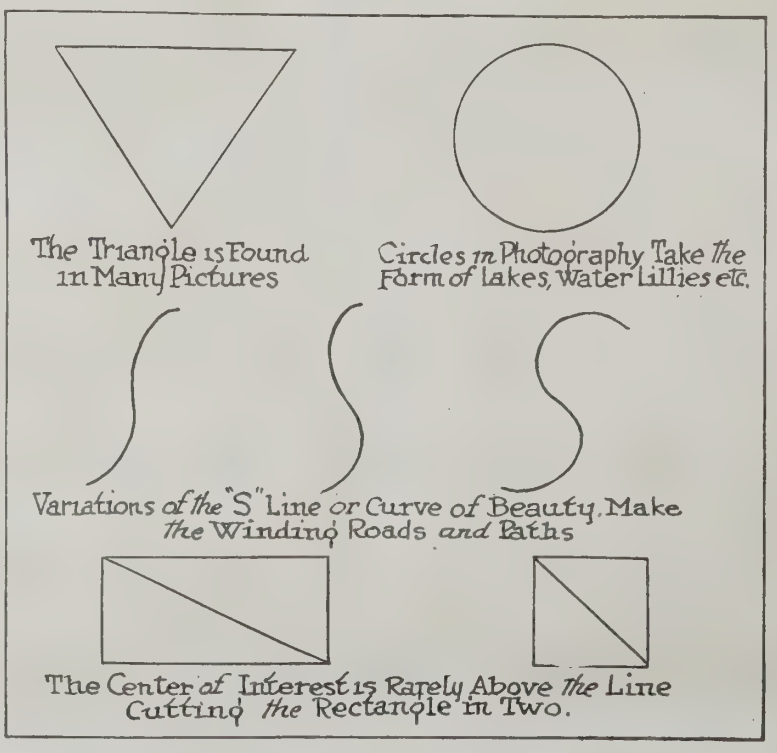
Will you have background in your picture? Then close the shutter so that only a small opening is used. But if you are not concerned with the background and would have it that hazy, frowsy sort which accentuates the object in the foreground which you desire to photograph, then open it wide and use less time in the exposure. For long deep vistas the small opening gives the desired sharpness while the near-by object uses the larger opening or aperture of the glass eye in the camera.

If time is long and a color filter (a piece of colored glass set in front of the lens) may be used, clouds may be obtained and the browns, grays and whites made more distinct and true. A color filter requires three or more times the exposure given without it and hurry is sure to bring disaster, just as care will return ample reward in the clear perfect tones and gradations.

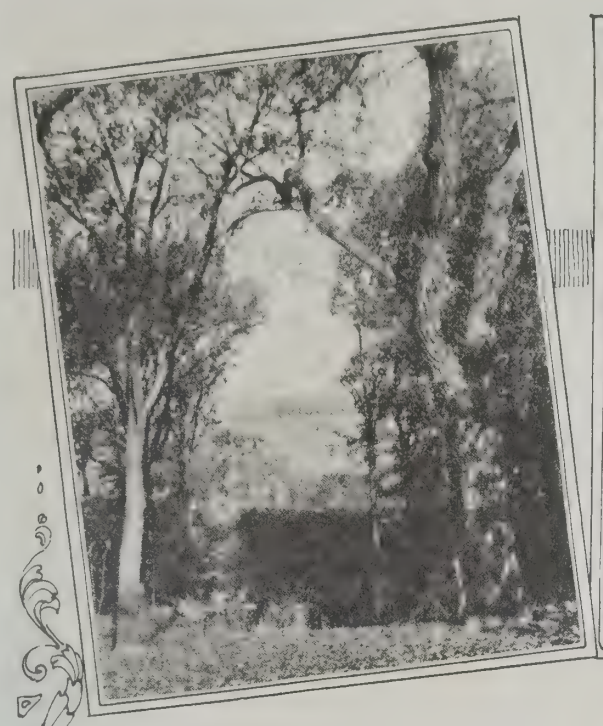
The eye follows the movement in the final picture and water, persons or animals moving toward the edge of the print are distracting. Watch an individual going down the street some day, see him climb a hill, and you will immediately wonder where he is going; but turn him around so that he walks toward you and your eyes begin searching the foreground to find what it is that brings him. An exception occurs when the person is absorbed in some task because we at once become interested in what he is doing and make that the center of interest. Shadows too, falling toward the camera, add life and in spite of the advice given every amateur, "always have your back to the sun," many of the best pictures have been made by pointing the camera almost directly toward the sun, shading the lens meanwhile with a hat or a cardboard to prevent "fog" or "ghost" from the direct rays.

It is easily possible so to point the lens that the shadows enter the scene, and clouds in such a picture will be the most beautiful because they then best display the silvery grays and whites, lights and shadows. Many of the so-called moonlight effects are taken directly against the sun and later the printing is deeper to show a greater and heavier depth of shadow, typical of the moonlight scenes we see at night, and not of the sunlight accompanying the day.

Photographers' trials begin when a picture of a group of picnickers or of campers around a fire is attempted. While everyone expects to see himself in the picture, every unposed camp fire or picnic scene shows everyone occupied and in making a photograph the position should not be changed unless it is desirable merely to have a picture of "the bunch." Otherwise some one must sacrifice his face for the best effect and if the camera catches everybody in a natural action, the picture will be a delightful success.



People will enter into many pictures and while their clothes often fail to harmonize with the surroundings, good results can be obtained by clever grouping or introducing action even though it be ever so minor. But—take a picture of a person looking down hill toward him and he becomes a convict while if slightly raised above the camera's eye he becomes a king. Therefore, if you would avoid injuring the dignity of your best friend, place him on a level or just above you.

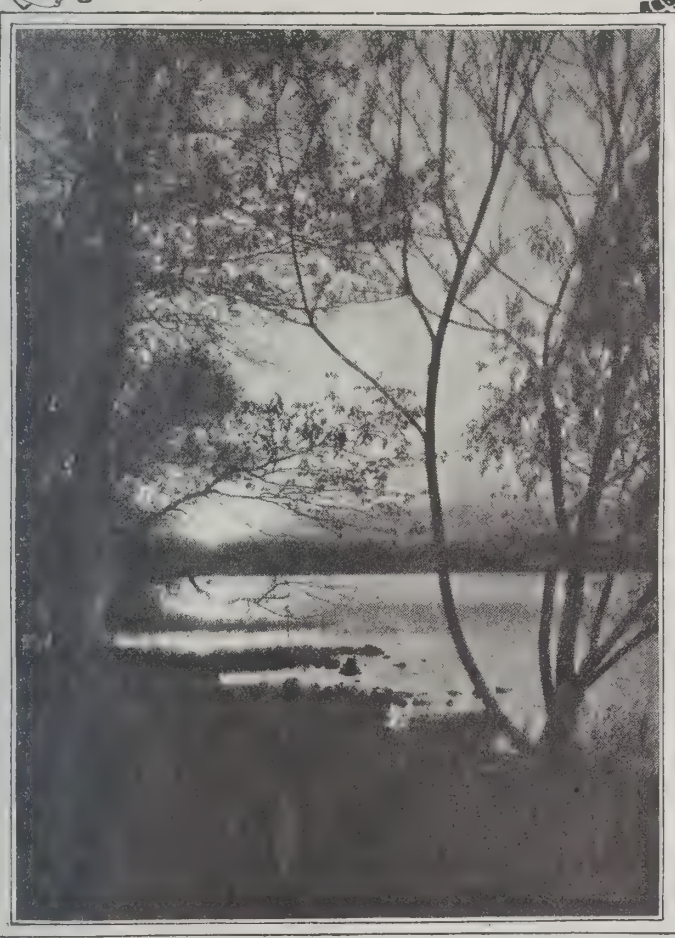


Only one object should be located as the central feature in any picture and in placing it thus at the center of interest the old example of the steelyards will help to obtain the proper balance. A small object a long distance from the center balances a large object near the center. Draw a line from one corner of the picture to another, place the principal interest in either the upper or lower triangle and a smaller object in the other triangle will balance it. Either right or left of the center and three-fifths of the distance toward the top of the picture is the happy location for the center of interest and even advertisers make use of this tendency of the eye to rest at such a point and accordingly place there the most important feature of their sales argument. Photography is an art peculiar in itself but so pliable that many of its points can be learned with care and practice. Six feet too near an object may spoil the picture and although the man who was farther away may trim his print before enlarging, the effect is often spoiled. Before cutting a picture try different positions with four pieces of paper and it will be found that very few pictures are taken which cannot be improved by simply cutting off a half inch on one side or an inch on either end.

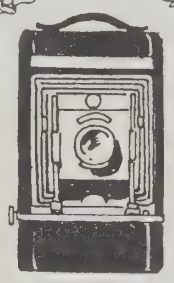
But the mass and the position of the mass referred to in the first part of the article determine much of the beauty, yet the objects usually arrange themselves in one of three forms—triangles, circles, or "S" shapes. By so manipulating the objects or by placing the camera to include one stone or bush while omitting another, these shapes may be attained and genre or life made a part of the picture. The use of "notan" or light and shade may produce a beautiful effect and attract the eye like the black and white of a checkered pavement.

Three objects may be used to constitute either an upright or an inverted triangle with the central object at the vertex. A stone and a burdock bush in opposite corners may balance a huge stone, a person, or even a small hut near the center, for the eye moves from one to the other with a feeling of pleasure.

For the oval, a large black tree against the horizon helps attain the ideal. Wonderful effects are produced by the human face with subdued background, and circular masses of shrubbery, ponds, water lilies and irises are all adaptations of the circle or oval.



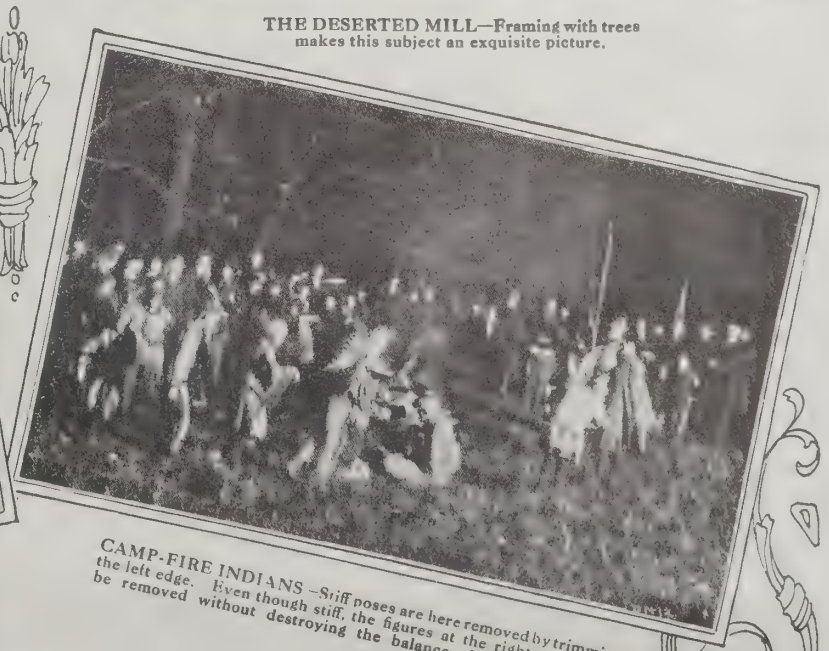
CHARMED VISTA—Touches of light through the branches of the trees in the right-hand side of the picture, balance the light from the opening vista, while the spot of sunlight toward the left entices the attention.



By retreating scarcely ten feet the photographer spoiled the effect of the distant scene. Trimming at both sides and top helps correct the error but an enlargement fails utterly.

An enlargement made from a portion of picture at left. While almost identical with it, note the foreshortening which brings the distant land too near the shore and destroys the sharp lines of the foreground shown in other picture.

ENTICEMENT—Light of setting sun falls in the lower left-hand triangle while the path of light leads the eye into the picture.



VILLAGE OF THE PLAIN—No better frame for a picture can be found than two trees in the foreground.

THE DESERTED MILL—Framing with trees makes this subject an exquisite picture.

CAMP-FIRE INDIANS—Both the groups at the right and left of the picture were interested only in the camera man and the photograph can be much improved by cutting as in picture at the right.

CAMP-FIRE INDIANS—Stiff poses are here removed by trimming the left edge. Even though stiff, the figures at the right can hardly be removed without destroying the balance of the composition.

For the Common Good

THE late William James, one of the wisest philosophers America has produced, once suggested that the only way in which war would be abolished would be by producing a substitute for slaughter and destruction along constructive and creative lines. He indicated that it should be one that would carry all the chivalric appeal to the imagination of men, especially to youth, that now constitutes the chief lure of militarism.

The appalling disaster of the Colorado floods suggests a very natural and logical line which the evolution of our fleets and armies might well take. Despite all our boasted progress, we must admit that humanity still seems to be at the mercy of the elements in a very large degree. We are far from having mastered the causes of frequently recurring calamities in the nature of fires and earthquakes, floods and drouths, with consequent famine, disease epidemics, and widespread distress.

The "expectation" of such human disasters is almost as measurable as the life insurance actuary's mortality tables. Yet each recurrent disaster seems to take us utterly by surprise. It is seemingly considered sporadic and even utterly anachronistic—a thing contrary to nature. So it catches us unprepared and our relief measures are haphazard to such a degree that failure and neglect and delay became responsible for a loss of life and property, as well as an aggravation of human suffering, that is appalling to contemplate.

The President's prompt action in putting at the service of the Colorado flood sufferers the military resources of the government in the way of tent-shelters and army rations, and the activity of the Red Cross, all plainly point to the shape intelligent organization to meet this great human need should now take. With slight changes the age-long development and testing of our military and naval organization and administration might be utilized by transforming armies and fleets into agencies for the preservation instead of the destruction of life and property; for the building up of the golden sentiments of peace and good will among men instead of the extension and intensification of black strife and ill will.

Are we too poor in imagination to paint the chivalric glories of service in a great army of the common good so brightly that its appeal to the adventurous spirit of youth and the patriot's ardor shall be less alluring than are the possibilities of poison-gas, high explosives and the mud and squalor of trench warfare?

No one knows better than the fighters in the "Great" War that its greatest heroisms were displayed by the surgeons and nurses in the first-aid stations and hospitals, and in the ambulance service, while the really big men who succeeded in getting food supplies to the front lines, despite the risks of constantly shelled roads, broken bridges and ways axle deep in mud, displayed greater generalship than the "masters of strategy" poring over maps in field headquarters.

Let us mobilize for this too long neglected human service!

The Trend of Taxation Theory

PARTICULARLY illuminating as showing the inevitable trend of thought in this country in the matter of taxation is a recent speech by Mr. Frederick F. Ingram, of Detroit, in support of the Federal land tax proposed by the Committee of Manufacturers and Merchants on Federal Taxation. This measure, if enacted, would levy a tax of one per cent upon "the privilege of the use and enjoyment of lands of large value"—landholdings not exceeding $10,000 in value being exempted. The outstanding feature of the proposed measure is that it would tax only natural resources such as oil, minerals, natural gas, water power and forests, and "socially created values" excluding improvements. Mr. Ingram points out that as the first object of taxation is found only in mineral lands and forests exploited by big corporations and the second mainly in large cities, the farmer would pay no tax at all on natural resources and very little on socially created values, which attach almost exclusively to urban sites where large social expenditures are made and where the net or ground rent of a square foot of land is often greater than that of many acres in the rural districts. The $10,000 exemption, furthermore, would let out all but exceptionally large-scale farmers—say, the "bonanza farmers" of the western slope.

Mr. Ingram makes a strong point in his reminder that while industrial values and land values are about equal in aggregate amounts, only about one-sixth of the Federal revenues are derived from land values, the remaining five-sixths coming from the joint product of labor and capital. It is urged that this proposal of the Manufacturers and Merchants' Committee would help to solve the acute problem of our present housing scarcity, as it would encourage building by freeing dwelling-houses and all other improvements on the land, as well as labor products, from all taxation.

It is estimated that such a tax would raise an additional billion dollars of Federal revenue annually, and would raise it in such a way that it could not be shifted to the prices of products or the rent of houses, so relieving industry of heavy burdens, lowering the cost of living and stimulating business by increasing the purchasing power of the people.

Curiously enough, Mr. Ingram objects to the criticism of the proposal as a form of the "Single Tax." Not on the ground that there is anything economically unsound or impracticable about the theory of Henry George, but because "there is danger of inciting unintended prejudice by linking the committee's scheme with an unpopular phrase." In a letter to the editor of the St. Louis *Globe-Democrat,* indeed, Mr. Ingram describes the "single tax" as an "epithet"!

As a matter of cold hard fact, the only difference between the Manufacturers and Merchants' proposal and the single tax is that the latter proposes to take for public purposes and as a substitute for all other taxation, Federal, state, county and municipal, the *entire* socially created unearned increment of land values, instead of the little one per cent of that increment.

The difference between the plan advocated by Mr. Ingram and that espoused by the Single Taxers is simply the difference between cutting off the tail of the dog an inch at a time and cutting it off at one fell stroke. The inch-at-a-time man regarded the process as merciful. Some day the farmer will wake up and tell the world what he thinks of it.

The Teeth of Lenin

A PROMINENT London physician advances a novel reason for Bolshevism. It is all due, he says, to the fact that Lenin and Trotsky suffer from bad teeth. No man whose teeth are good is likely to fall into ill health, and no really healthy man ever becomes a "Red."

It is being generally realized that many functional and nervous disorders may be traced directly or indirectly to infection from decayed teeth. There is obviously close connection between indigestion and defective mastication. That many men dig their graves with their teeth is an old saying. It has reference to the evils of over-feeding or reckless eating. But the man who follows Fra Elberta's advice to "Fletcherize his food more and the rag less" will live long and happily.

Cassius was lean and hungry in all probability because of a failure to Fletcherize and to assimilate his food. The London physician but confirms the judgment Shakespeare puts into the mouth of Caesar that "such men are fit for treasons, stratagems and spoils." If we are going to destroy Bolshevism, it might not be a bad idea to ship into Russia a shipload of tooth brushes and tooth powder. After we have drawn the dictator's bad teeth, we might furnish him with a new set of good American make, warranted to bring about the *mens sano in corpore sana* that may prove the beginning of a new and brighter era for Russia. There remains, however, the great question: "Is Lenin's nasty disposition due to his bad teeth, or his bad teeth to his nasty disposition?" As a man thinketh so he is; but it is also well settled that while grief and worry may induce cirrhosis of the liver, that very condition of liver increases the tendency to grieve and worry. Once the vicious circle is started there is no telling where it will end.

Watch your teeth, boy!

The Flood of Gold

THERE is weeping and wailing and gnashing of teeth among the owners of gold mines all over the world. They complain that the yellow metal does not pay costs of production at present prices. In other words, it is loudly asserted that the gold dollar is a very dishonest dollar and that gold is now worth more than the price paid by the mint.

The same complaint goes up from the depths of the Rand mines in Africa, from the Australian diggings, from South and Central American mines and from our own and the Canadian gold-fields. The fact is a very big one and should set men thinking. As long as gold really served to a large extent as money, or as a "basis" for paper money, and the great bulk of the supply was destined to that purpose, the large and constant market demand created by government monopoly and price fixing made gold mining a profitable industry. The practical demonetization of gold that has taken place in recent years has deprived the gold producer of his one best market. Gold is slowly but surely illustrating the universal process of price formation through the operation of the law of supply and demand.

Instead of tearful appeals to the governments of the earth to "debase" their own coinages by decreasing the weight of gold in the coins that we have been calling "units of value," because the prices the gold cornerers had induced the governments to fix in their favor have become unprofitable, the gold-producers would show more enterprise if they availed themselves of modern commercial publicity methods to increase the effective demand for their product in the arts.

There are a thousand uses to which gold might be put, but in which it has been denied to the people by the blindly selfish policy of locking it up in the vaults of the Treasury and the big banks. Let the gold producers seek and develop these natural markets, and it may prove that the demonetization of gold has been a good thing for them.

The situation suggests an interesting problem. If the gold coin and bullion actually held by the United States Treasury has an actual market value today of some ten per cent less than the "paper money" which the United States alone among the governments of the world holds itself obliged to "maintain at a parity with gold," who takes the loss represented by the difference between what the government paid for that metal and its present market value?

Incidentally, there are indications of a new flood of gold in two directions. A strike is reported at Rice Lake, Manitoba, of ore assaying about $200 to the ton (for years past the Treadwell mines of Alaska have been working and treating profitably low-grade ores averaging only $1 to the ton), and even richer deposits have been opened up in the Republic of Colombia and in Patagonia and in Iceland.

The Bolshevists are shipping to us directly and indirectly an accumulated store of gold for exchange in the more useful and valuable commodities for which they have pressing need. This transformation of cheap gold into high value products of American labor and capital is also being managed by Jewish Wall Street firms in the matter of the payments of Germany to the Allies on account of reparations.

Have the international bankers got all the gold they want? Or are they anticipating the early falling out of the bottom of the "gold basis" theory, and putting their gold into tax exempt bonds?

Price Publicity

THERE is sound sense in Secretary Hoover's suggestion, in his Atlantic City address, of fuller publicity for primary prices, and for figures of production and consumption, as a remedy for profiteering. For this service of compilation and publication, he advocates the maintenance of a government information service.

Mr. Hoover's argument seems convincing. Realization by the buying public of the true conditions in the industries, he points out, would make for the curbing of vicious speculation and the enhancement of soundness and stability in business conditions.

Some such service as is suggested would probably do much to make difficult, if not impossible, much of the "passing of the buck" in regard to the responsibility for high prices that now confuses and bewilders the ultimate consumer, leaving him helpless to check profiteering on the part of the retailer, who in turn is pretty much at the mercy of jobber and manufacturer. In this matter, as in the relations between nations, we want less of "secret treaties" and more of "open covenants openly arrived at." In the end, of course, even "pitiless" publicity will be found profitable all 'round.

Turn on the light!

Mr. Ford's Page

THE only communism that ever helped men, and that ever will help men is the communism of thought and understanding. Our modern life has taken a direction which makes it necessary for people to become acquainted all over again. We form our conclusions of persons and classes apart from them and, as a result, the world is dealing with dummy figures which never existed, and with types of men who are few and unimportant.

There was a time when people knew one another more intimately than they do now, and that time is still present in other countries. People knew one another in America when they were more dependent on one another. When neighborliness consisted in a community of understanding, sympathy and helpfulness, when neighborliness was a duty such as "keeping up an appearance" is now regarded, there was a widespread social knowledge, gained by contact, which is now only imperfectly gained from other sources.

Then the industrial era opened; the amount of money handled by each family increased; the things that people used to do for one another, were hired done, or done within the family; in a word, people became more independent on one another, and thus drifted apart. Neighborhoods, on the surface at least, are not what our forbears remembered them to be, nor even what they were in our youthful years. Indeed, there are no "neighborhoods" in the larger cities; there are just "localities."

Perhaps it is not as bad as this; it only appears as bad. From time to time there comes news of a revival of the old neighborly spirit. Trouble comes to a family that has lately moved in and whom no one knows, and presently the neighborhood spirit—sleeping, but apparently not dead—discloses itself again in those old and homely acts which, while they often have small power to heal the circumstance, have nevertheless a very potent power to soothe sore hearts.

Try as we may to relegate all this to the realm of useless sentimentality, the fact remains that there is mysterious power in just the compassion of men for one another in their difficulties. There is not enough of it, and the reason is that we have made ourselves believe that material sufficiency makes us independent of all men. Not so. As a matter of fact, no one is so constantly dependent on other men than he whose interests and responsibilities are great.

But if experience teaches us anything it is this, that there is no readjustment without its compensation. The only constant and reliable fact is change. Life is a river whose sources are hidden, whose ultimate sea is not in view, and no work of man is quite so vain as that which seeks to fix life in a certain form for all the future. Create the form you dote on; establish it by revolution or the people's suffrage; yet as soon as it is established, the law of change begins to eat it away, and in a generation men reared under your form will be sadly saying, "Things are not what they used to be."

And if we have been dislodged out of our reliance on the neighborhood, it has all been a profitable thing; by it we have been thrown back into more reliance upon ourselves.

After all, the successful man is the man who has no fear of himself. The true man of the world is the man who feels that as long as the earth turns round and the seasons come he is in his proper home, with all needful things awaiting his command.

If there is one element of darkness which one would banish from the earth sooner than any other, it is this element of fear. Fear is the offspring of a reliance placed on something outside—on a foreman's good will, perhaps, on a shop's prosperity, on a market's steadiness. That is just another way of saying that fear is the portion of the man who acknowledges his career to be in the keeping of earthly circumstance. Fear is the result of the body assuming ascendancy over the soul. It is the fruit of the mind that acknowledges itself to be a bond-slave. Many men fear every undertaking, and when you analyze the sources of their fear you will find that it is nothing but the memory of their own previous failures. Men are like colts; if they are permitted to fail too often, it becomes a habit with them. Colts, however, fail because they are overloaded; men, because they do not "adjust their efforts to obstacles"—which was Napoleon's rule.

This habit of failure is purely mental and is the mother of fear, and like any other bad habit it carries a great deal of blameworthiness with it. Men fail—everybody fails—experiment and the getting of expertness can be achieved by no other means than by items of failure; but to let failure in details or in experiment fix the habit and the fear of failure on the mind is not only tragic but positively sinful.

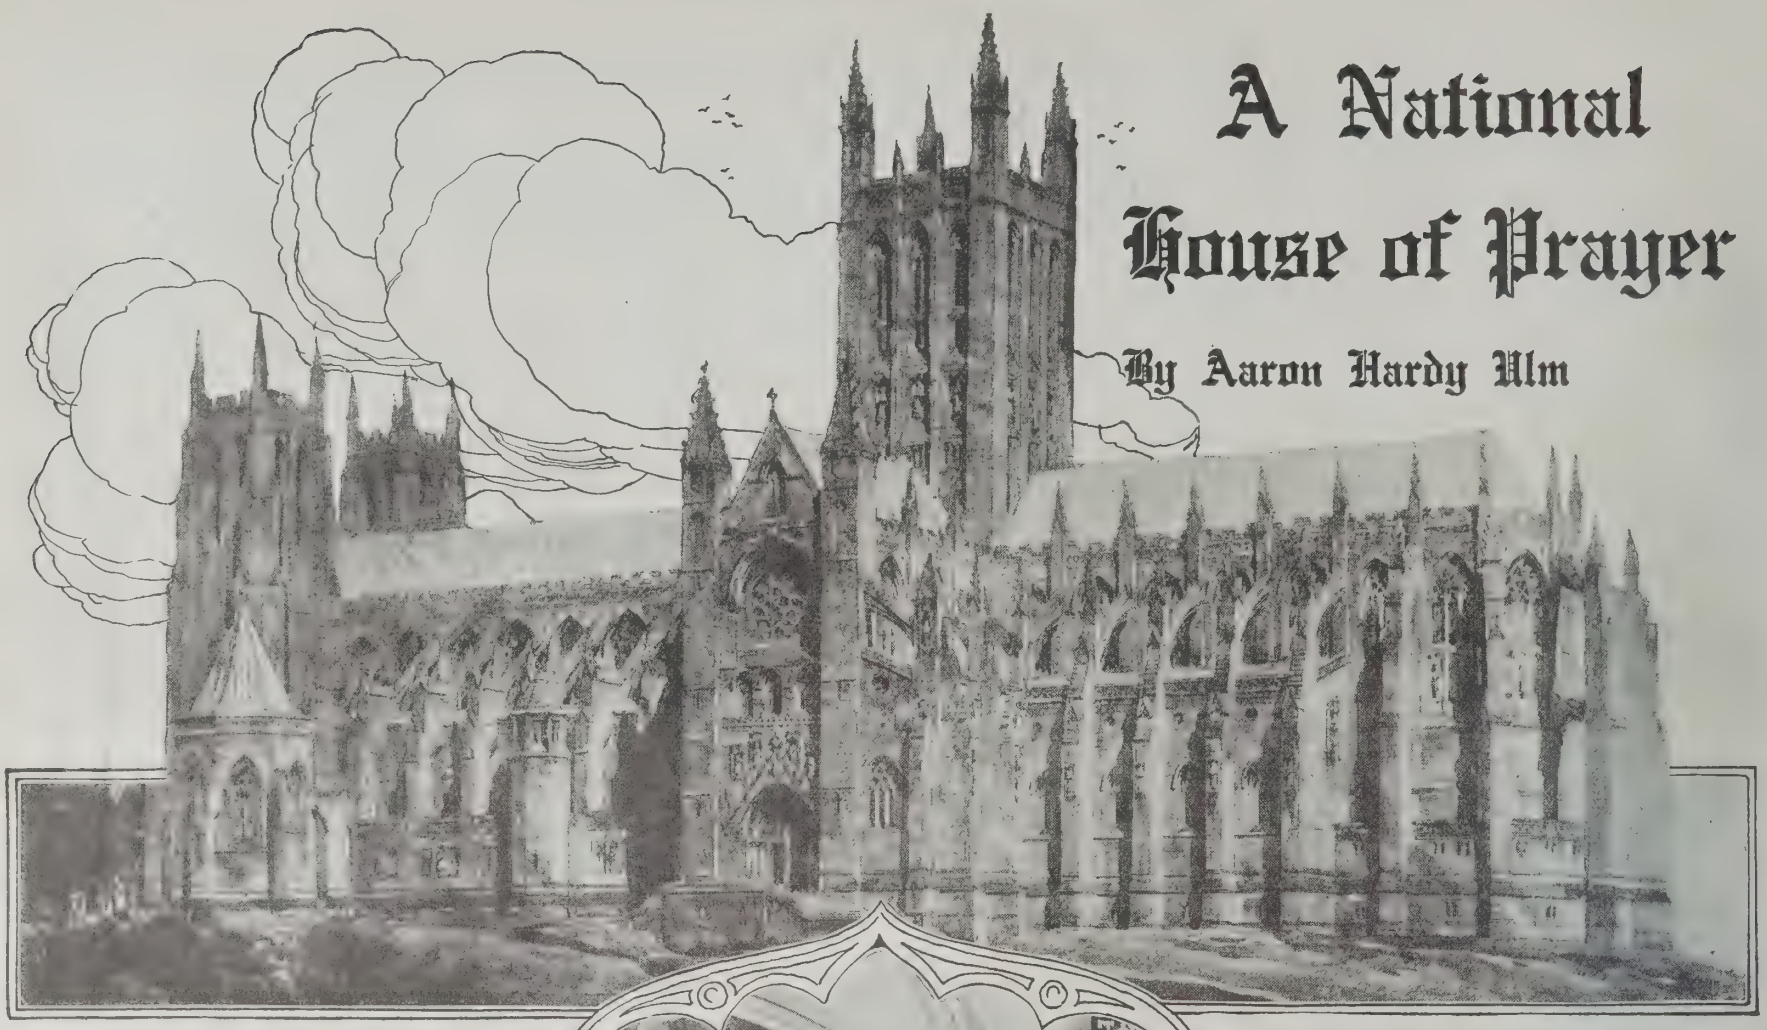
This habit gets itself fixed on men because they lack vision; that is, they start out to do something that reaches from A to Z of a certain matter. Now, at A they fail, at B they stumble, and at C they meet what seems to be an insuperable difficulty, and then they throw the whole task down—beaten! They have not even given themselves a chance to fail; they have not given their vision a chance to be proved or disproved; they have simply been beaten by the natural difficulties that attend every kind of effort.

It is a very serious thought that more men are beaten than fail. It was not wisdom they needed, nor money, nor brilliance, nor "pull," but just plain gristle, plain bone. This rude, simple, primitive power which we call "stick-to-it-iveness" is the uncrowned king of the world of endeavor.

People are utterly wrong in their slant upon things. They see the successes that men have made and somehow they appear to be easy. But that is a world away from the fact. It is failure that is easy. Success is always hard. A man can fail in ease; he can succeed only by paying all that he is and has. It is this which makes success so pitiable a thing if it be in lines that are not useful and uplifting to the people.

Men ought to learn not to keep putting their trust into what they deem untrustworthy. If a man is in constant fear of the industrial situation he ought to change his life so as not to be dependent on it. There is always the land, and fewer people on the land now than there ever was before.

If a man lives in fear of an employer's favor changing toward him, he ought to extricate himself from dependence on any employer. He can become his own boss. It may be that he will be a poorer boss than the one he leaves, and that his returns will be much less, but at least he will have rid himself of the shadow of his pet fear, and that is worth a great deal in money and position.



Better still, is for the man to come up through himself and exceed himself by getting rid of his fears in the midst of the circumstances where his daily lot is cast. Become a freeman in the place where you first surrendered your freedom. Win your battle where you lost it. And you will come to see that, although there was much outside of you that was not just right, there was more inside of you that was wrong. Thus you will learn that the wrong inside of you spoils even the right that is outside of you.

A man is still the superior being of the earth. Whatever happens, he is still a man. It may rain tomorrow—he is still a man. Business may slacken tomorrow—he is still a man. He goes through the changes of circumstances, as he goes through the variations of the temperature—still a man. If he can only get this thought reborn in him, it opens new wells of water and new mines of wealth in his own being. There is no security outside of himself. There is no wealth outside of himself. The elimination of fear is the bringing in of security and supply.

SUCCESS looks easy, but it is really the failures that are easy. And yet there are few failures. Few men go far enough to know whether what they attempted, what they saw in their vision, would be a failure or not. They never gave their idea a fair chance. They were simply beaten by the initial difficulties, and never got as far as the real problem. What they attempted has often been a success when taken in other hands. If men were not so easily beaten, if they would not give up so readily, if they believed enough in their vision to stay with it to the end, just as they stay with their families, there would be very few failures. It is fear that ails men. Men have their pet fears. And these pet fears, like spinsters' cats and canary birds, rule the house of life. Get rid of them. Open the doors and let them run away.

A National House of Prayer

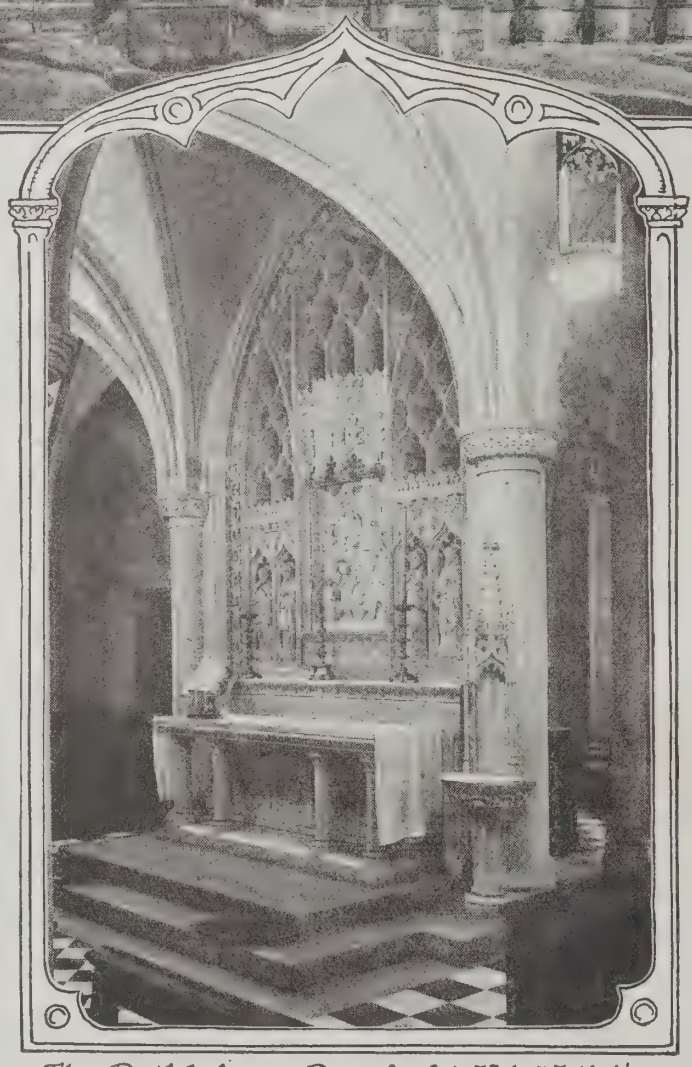
By Aaron Hardy Ulm

The Washington Cathedral.
from a Water Color Drawing

A FREE church—a beautiful church—a national church! Such might be put forth as a description of what is proposed in the form of the Washington Cathedral, an edifice that promises to be among the most notable contributions to American architectural and institutional achievements.

Though it is being promoted by the Episcopalians and will be identified with that denomination, the cathedral has been planned as a national undertaking and in great measure is to be free from the restrictions of creed. Its promoters characterize it as a "National House of Prayer" where the poor may go on equal terms with the rich and where the visitor from the Far West, the East or the South will be as welcome and just as much at home as the regular attendant from the parish in which it is located. It is to have no congregation in the parish sense, no "members" whose whims or views must be taken into account by those who speak from its pulpits, entrance to which will not be measured by the color of the message to be delivered.

Like all great cathedrals, that in Washington is growing rather than being built. The first plans for it were made more than thirty years ago, the corner stone was laid nearly fifteen years ago, the first moves toward the establishment of the institution were taken more than twenty years ago. Yet today the foundation is still uncompleted, and the handsome lines of the apse alone give outward view of the magnificence the structure will display when finished—perhaps five years from now and possibly several times five years.



But when completed the Washington Cathedral will be an addition to the rounding out of the national capital as an expression of the ideals of America. Already in the variety and handsomeness of its buildings, the beauty of its parks and the harmony of its general arrangement, Washington probably leads all the capitals of the world. But our national capital has not yet attained the full degree of American expression that was expected of it by its founders and especially the one for whom it is named.

George Washington expected our capital to be more than an expression of the American sense of civic beauty. He thought it would develop even into a commercial metropolis, which might have happened but for the revolution in economic development caused by the building of railroads. He wanted the city of his name to include some outstanding representation of every important element of our national life. But the great national university which he sponsored in his will has not yet come into existence there. The cathedral will carry out his hope that there be at the capital a great edifice that would express the religious feelings of and be a common religious meeting ground for the nation.

It is noteworthy that, with all the grandeur that has come into existence in Washington, little of it is reflected through the symbols of religion. It is the only great national capital in the world that has been without a cathedral standing as a symbol jointly for the sense of beauty, religious fervency and the enduring faith of all the people.

Of course, in this country there is and can be no great state church as in most of the lands famous for their cathedrals. Though church and state are forever separated in the United States, no country probably is more religious than America. And there is no reason why there should not be at the national capital some religious establishment that may be accepted as an expression of all America.

Such is what is intended for the Washington Cathedral. While its architecture follows the Gothic of the great cathedrals of Europe, it is to be in many respects different from like institutions both abroad and in this country. One point of difference is that it is not to rise from the mass of congestion that surrounds most other cathedrals. Believing that our national capital will grow in immensity and thinking in terms of centuries, the cathedral promoters began concrete operations by buying a tract of forty acres of land on the then outskirts of the city. The Cathedral Close is situated on Wisconsin avenue, at a point known as Mount St. Albans, the highest spot in the District of Columbia. The section has developed considerably since the cathedral was conceived, but the location is still outside the center of things in Washington. However, it lies along the path of growth and is not remote.

The Bethlehem Chapel *of the* Holy Nativity *in the* Crypt *of the* Washington Cathedral.
A View of the Altar

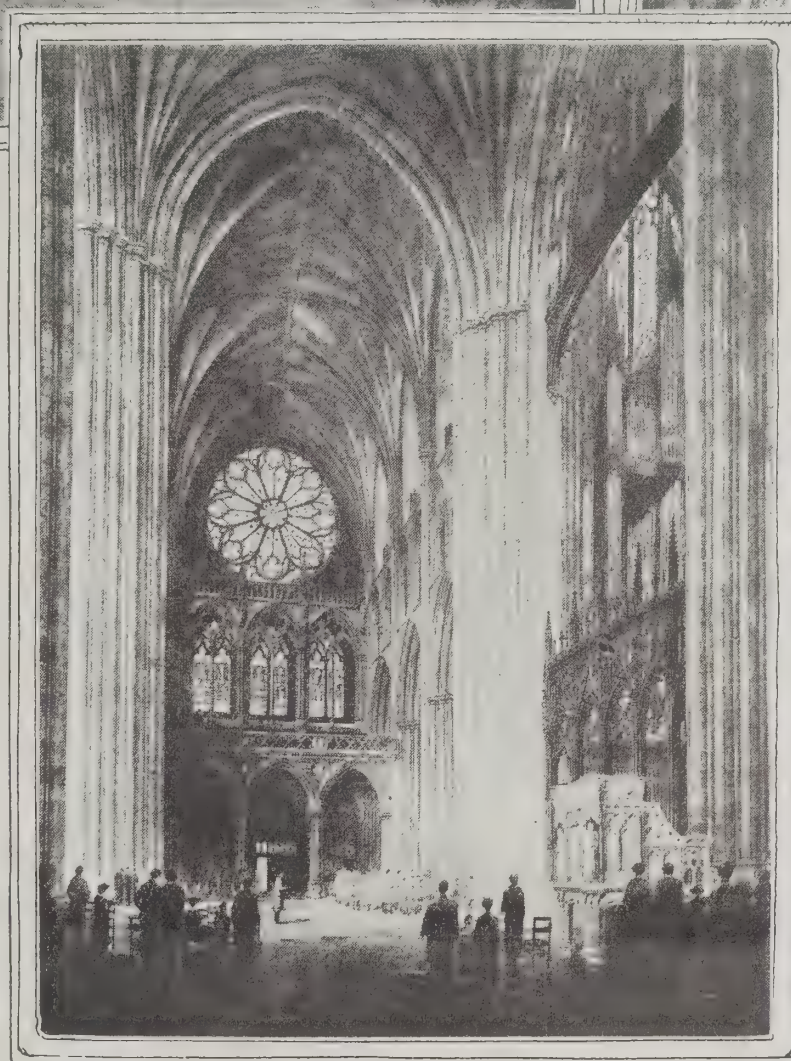
"There is no good reason why the space about a great cathedral structure should be crowded," said one of the cathedral canons in explaining why the near-suburbs were sought for a location. "If the grounds are ample, the structure will be more beautiful because of the setting which can be harmonized with it. While a cathedral should be accessible to all and, above all, a poor man's church, it is still something that will be enjoyed more if in some degree it has to be sought and is not thrust upon the passer-by."

Another reason for the situation of the Washington Cathedral is that as an institution it comprises more than adheres to like establishments elsewhere. It is to be more than a great church. Already there are a girls' and a boys' school attached to it and parts of it, and it comprehends a social service as well as a religious and an educational program.

"A cathedral is meant as a witness to Christ and a help to humanity not only by means of its beauty but also by being a dynamic center, a central dynamo plant, as it were, for all manner of proper activities for the promotion of religion, education and philanthropy in the community and the nation," says Dr. W. L. DeVries, residentiary canon of the cathedral. "At the cathedral many powerful agencies and influences are maintained for the benefit of the community and of the many visitors and sojourners at the national capital. It is to be and is absolutely a free church. There are and will be no rented pews; in fact, there will be no pews at all—only chairs to be assigned worshipers in the order of their arrival. The pulpit is and will ever be free. Here great national and social questions may be handled fearlessly and frankly by the preacher. In parish churches, the local pastor is often hindered by the influence and domination of powerful individuals in his congregation or by the necessity of considering the interests and sorrows of innocent persons who would be deeply wounded by the condemnation of measures in which prominent members of their families are engaged. The better pastor a man is, the less fearless he is apt to become as a preacher; and those who understand can hardly condemn but must indeed commend ministers unwilling in any way to hurt the sheep committed to their charge. But at a cathedral the preacher does not know the personalities of the congregation before him, for the congregation changes every Sunday, and he himself is usually a visitor, so that absolute truth without regard to its bearing on the individual may be and is aimed at.

"Unlike the medieval cathedrals of Europe, with their deep-seated customs and traditions of a united church and state, the Washington Cathedral will stand on the firm foundation of a free church and a free state—free from any entangling alliance with the government; free to send a Savonarola into the cathedral pulpit to hold up the gospel standard of Christ himself amid the evils which honeycomb the social and political life of the capital of every modern nation; free to proclaim fearlessly the danger of denying Christ and becoming 'sub-Christian' when the tendency of the people is to accept no higher ethic than that of civil government itself; free to exercise spiritual leadership when the influences of such leadership will be needed and felt, and welcomed by high-minded statesmen themselves.

"The various undertakings of the cathedral both in and outside of Washington show that it is not a local but a national institution in its aims and objects. Even if its clergy did not extend their activities beyond the District of Columbia, the cathedral would be national. Very few people are permanent residents of Washington. People come here from all parts of the country and the world. I have known a congregation of 3,000 people here to contain, by actual count, persons from every state in the Union."



The national concept applies to the funds being provided for the completion of the cathedral, and to a large extent to the make-up of the board of trustees and the council which control the corporation that holds title to the institution, in which most sections of the country are represented. The corporation has not been limited even to the Episcopal Church but has included adherents of other denominations. Contributors are

limited neither to the section where the cathedral is located nor to members of the Episcopal Church. Some of the largest givers have been non-Episcopalians. Out of twenty-eight donations coming on a single day recently, two were from Unitarians, one from a Baptist, one from a member of the Dutch Reformed Church, two from Christian Scientists, one from a Presbyterian and one from a Jewish rabbi.

They are endeavoring to finance the institution by the aid, in large part, of small contributions from persons in all sections of the country and of all creeds.

About $3,000,000 has been raised. When the construction work began they expected to complete the cathedral at a maximum cost of about $5,000,000. At present prices, the cost will total about $8,000,000, or approximately one-third of the cost of constructing a battleship, which would have a life of only fifteen years against one of centuries for the cathedral. The endowments which they hope to procure for the maintenance of the cathedral and its subsidiary work will call for additional millions.

Building operations began in 1910 and proceeded until brought to a stop by our entering the war. A part of the foundation has been laid and one chapel, named Bethlehem Chapel of the Holy Nativity, has been completed, and the apse or eastern end has been erected.

The chief designing work was done by the late Dr. George F. Bodley, who was the world's leading Gothic architect, and Henry Vaughn, of New York, though many of the leading architects gave expert advice. The general style of the cathedral is 14th century Gothic.

"The aim of the architects has been not to copy and raise on American soil any particular cathedral of England or the Continent," says a description prepared by the cathedral staff, "but to reproduce the Gothic style itself, in its best period and in the spirit of the old masters. Hence it is in design and model a vivid reminder of the cathedral with which one is familiar, whether that be Canterbury or Westminster Abbey, York Minster or Lincoln, Cologne or Rheims. Thus the Washington Cathedral is thoroughly typical of the best period of Gothic architecture, and yet, at the same time, it has an individuality all its own."

One of the features of individual distinction will be a great central doorway flanked by a smaller one on each side. This differs from the cathedrals of England, excepting those of Peterborough and Lincoln. In that northern clime there is more need for the western light, with the result that in most of the cathedrals large rose windows dwarf the entrance below. It differs also from the French cathedrals, whose entrances are marked by richly carved and recessed doors whose depth and beauty are gained by the devising of Gothic porches which project before and mask the cathedral facade. The central arch will be seventy feet in height and the two side ones will be fifty feet, and thus pierce two lofty towers on the west front. The great central tower will rise 220 feet.

It will not be one of the largest cathedrals, not quite so large even as that of St. John the Divine in New York. The size makes possible the achievement of more harmonious effects and greater beauty. It will provide space for 27,000 persons standing or more than 5,000 persons seated. It will thus have a capacity beyond that of any opera house in the country, and slightly larger than that of St. Paul's Cathedral in London and considerably more than that of Notre Dame in Paris.

There will be three chapels. Bethlehem chapel of the Holy Nativity, already constructed and in use, is in the crypt. It is of unusual architectural beauty and impressiveness. It is regarded as a memorial to the late Bishop Satterlee who had charge of the Washington diocese during most of the time when the cathedral was being planned and who is responsible for much that has been done.

The "Lady Chapel" in the east end of most English and Continental cathedrals is omitted as well as the coronet arrangement of chapels around the apse as found in the French cathedrals. It was thought best to omit those effects from the Washington Cathedral so that nothing will break the proportions and the height of the apse.

For the two main chapels the choir aisles are used. They will each be about one hundred feet long. They will be named for St. John and St. Mary, the Virgin. The choir, the transepts and the nave will be impressive in their proportions and harmonious in their effects.

Unusual art conceptions are expressed in the interior fittings, some of which already have been installed. Even before the fabric of the structure was begun there was brought from Palestine stone for the High Altar of the cathedral. The stones came from the supposed quarries of King Solomon and the ledge of the rock in which the sepulchre of Christ was hewn. The altar is the gift of all the dioceses of the country.

Stones also were brought from the River Jordan for the Jordan Font, which is of such ample proportions that a person may be either immersed or sprinkled when being baptized. The bishop's seat, called the Glastonbury Cathedra, was fashioned from stones brought from the ancient British Abbey of SS. Peter and Paul, from which was taken the formal official name for the Washington Cathedral.

The Archbishop of Canterbury has contributed a stone pulpit, called the Canterbury Ambon, made from stones taken from the Canterbury Cathedral. The pulpit was given in memory of Stephen Langton, the Archbishop of Canterbury who led the Barons when they wrung Magna Charta from King John. The carvings and statues will tell something of the story of civil and religious liberty as evolved and maintained by Anglo-Saxon peoples.

The cathedral will contain ample space for the erection of memorials that Time will make fitting and also for the deposit there of the remains of notable persons. Some memorials already have been erected—notably one for Major Archibald Butt who lost his life in the Titanic disaster; and a few interments, as that of the remains of Bishop Satterlee, have been made there.

It is expected that the cathedral will take on something of the character of Westminster Abbey, as a sacred repository for national figures and for memorials to notable persons.

The length of the structure will be 500 feet, the span of the nave 39 feet and its height 93 feet. The area is 63,500 feet.

The foundation alone will cost more than a half million dollars and the choir nearly one million.

While the government has taken no official part in the development of the cathedral—that is to say, beyond a national charter granted by Congress—the designing of the structure and its environment has been under the advice and carried on with the co-operation of government specialists familiar with the needs, and students of the future of Washington.

While the Cathedral is technically an institution belonging to the diocese of Washington, the Episcopal Church as a national body is giving it support and sharing in its development.

While the institution in the beginning was given the name of the Cathedral of SS. Peter and Paul, the real titles of such establishment are invariably the products of custom. The designation of the institution now varies from the Washington, the National and the Washington National Cathedral.

Jewish Idea in American Monetary Affairs

The Remarkable Story of Paul Warburg, Who Began Work on the United States Monetary System After Three Weeks' Residence in the Country

MR. BRISBANE says that Jewish bankers exercise their large measure of control because they are abler than the other bankers. It was very good of Mr. Brisbane to say so, and it adds to the sum of his weekly, almost daily, worship at the Jewish shrine, but it is scarcely true. Jewish bankers do not yet control the United States, and the principal reason they do not is that they are not abler than the other bankers. Doubtless they seek control; doubtless they have almost grasped it on several occasions; but not yet.

Nevertheless they form such a formidable force, and with their international connections constitute such a political problem, that the mere fact of their failing to top the column of control is not so reassuring as it sounds.

The great Jewish banking houses of the United States are foreign importations, as perhaps everyone knows. Most of them are sufficiently recent to be considered in their immigrant status, while the thought of them as aliens is stimulated by their retention of over-sea connections. It is this international quality of the Jewish banking group which largely accounts for Jewish financial power: there is team-play, intimate understandings, and while there is a margin of competition among themselves (as at golf) there is also a wiping out of that margin when it comes to a contest between Jewish and "Gentile" capital.

Four Jewish-American Financiers

FOUR conspicuous contemporary names in Jewish-American finance are Belmont, Schiff, Warburg and Kahn. All of them, even the most recent, are of foreign origin.

August Belmont was the earliest and arrived in America in 1837 as the American representative of the Rothschilds in whose offices he had been raised. His birthplace was that great center of Jewish international finance, Frankfort-on-the-Main. He became the founder of the Belmont family in America, which has largely forgotten its Jewish origin. Politics was a part of his concern in this country, and during the critical time from 1860 to 1872 he was chairman of the national Democratic committee. His management of the Rothschild interests was exceedingly profitable to that house, although the operations in which he engaged were quite simple compared with the operations of the present day.

Jacob Schiff is another Jewish financier who was given to the world by Frankfort-on-the-Main. He entered the United States in 1865, after having passed his apprenticeship in the office of his father, who was also an agent of the Rothschilds. The name Schiff runs a long way back without change, unlike the name of Rothschild. Originally named Bauer, this family of financiers took a new name from the red shield which adorned their house in the Jewish section of Frankfort and thus became "Rot-schild." Commonly the last syllable is pronounced as if it were "child"; it is "schild," shield. An epoch-making family in itself, it has trained hundreds of agents and apprentices, of whom Jacob H. Schiff was one. He became one of the principal channels through which German-Jewish capital flowed into American undertakings, and his agency in these matters gave him a place in many important departments of American business, especially railroads, banks, insurance companies and telegraph companies. He married Theresa Loeb, and in due time came to be head of the firm of Kuhn, Loeb & Company.

The International Mr. Kahn

MR. SCHIFF, too, was interested in politics with a Jewish angle, and was perhaps the moving force in the campaign which forced Congress and the President to break off treaty relations with Russia, then a friendly nation, on a strictly Jewish question which had been skillfully given an American aspect. Mr. Schiff was of inestimable assistance to Japan in the war against Russia, but is understood to have been disappointed by Japan's shrewdness in preventing too high a return being made for that assistance.

Associated with Mr. Schiff in Kuhn, Loeb & Company is Otto Herman Kahn, who is probably more international than were either of the two gentlemen mentioned above and is more constantly engaged in dabbling in mysterious matters of an international nature. This characteristic may be accounted for, however, by his experience of many countries. He was born in Germany and is also a product of the Frankfort-on-the-Main school of finance, having had connections with the Frankfort Jewish house of Speyer.

Of just how many countries Mr. Kahn has been a citizen is a question not easy to determine here because of the doubt that was recently cast upon his American citizenship by a protest against his being permitted to cast his vote last year and by his failure—the announced cause being physical indisposition—to cast his vote. If Mr. Kahn is a citizen of the United States (a status that will be readily proclaimed upon proof that he is), that probably increases the number of his citizenships to three. He was a German citizen by birth, and served in the German Army. And in 1914, in August, at the time of the outbreak of the European War, when efforts were being made, which afterward succeeded, to put Paul M. Warburg, a member of the firm of Kuhn, Loeb & Company, on the Federal Reserve Board, Mr. Warburg testified that at that time Mr. Kahn was not a citizen of the United States.

> Senator Bristow—"How many of these partners are American citizens, or are they all American citizens . . . ."
>
> Mr. Warburg—"They are all American citizens except Mr. Kahn."—(P. 7, Senate Hearings, August 1, 1914.)
>
> Senator Bristow—"Now, the members of your firm, are they all American citizens except Mr. Kahn?"
>
> Mr. Warburg—"Except Mr. Kahn, yes."
>
> Senator Bristow—"Was Mr. Kahn ever an American citizen?"
>
> Mr. Warburg—"No."
>
> Senator Bristow—"He never was?"
>
> Mr. Warburg—"No; he is a British subject."
>
> Senator Bristow—"He is a British subject?"
>
> The Chairman—"He lives in England, does he not."
>
> Mr. Warburg—"No. At one time he thought he would move to Europe, and that was when the question arose of his standing for Parliament; then he changed his mind and moved back to the United States."
>
> Senator Bristow—"He was at one time a candidate, or a prospective candidate for Parliament, was he not?"
>
> Mr. Warburg—"No; he was not; but there was talk about it; it had been suggested, and he had it in his mind. Something had been written about it in the papers."—(P. 76, Senate Hearings, August 3, 1914.)

So, that if Mr. Kahn is a citizen of the United States now, which as a matter of fact has been disputed, then he has been a citizen of three countries, Germany and Great Britain being the other two.

Enter Paul Moritz Warburg

MR. KAHN, by the way, is one of those Jews whose adoption of another form of faith brings no denunciation whatever from the Jews themselves. A most peculiar circumstance! But doubtless not inexplicable. Mr. Kahn is not called a "renegade Jew" nor any of the other nasty names heaped upon Jewish converts to Christianity, because he does not deserve them. They would not fit him. He is not renegade. And he never was regarded for a moment by Jacob H. Schiff as anything but a Jew, else that "Prince of Israel" would not have chosen him to remain in America and run the business of Kuhn, Loeb & Company, at a time when it seemed undesirable to put the junior Schiff in full charge of it.

Doubtless it was Mr. Kahn's desire, just at the time Jacob Schiff made his wishes known, to go to England and stand for Parliament.

But from New York he fulfills, probably as well as he could from London, those mysterious missions which frequently take him to the Continent, at which times he makes what are regarded as certain authoritative decisions, though just *whose* decisions it is not always possible to say. In Paris particularly, and at points east thereof, Mr. Kahn has been established in the position of spokesman of the American Financial Hierarchy, which, of course, he is not. But he undoubtedly is the spokesman of some group, possibly the group which so ably put through the Jewish program at the Peace Conference, the group that impressed Eastern Europe with the feeling that the United States of America was a very powerful Semitic empire. Mr. Kahn's trips abroad are usually unheralded, but their results richly repay observation.

A fourth member of the Jewish financial group in America (which is the form of statement which Mr. Chaim Weizmann would sanction, rather than to say "Jewish-American financiers") is Mr. Paul Warburg, to whose testimony we have just alluded.

Mr. Warburg is the most recent of all. He was born in Germany in 1868; he came to the United States in 1902; he became an American citizen in 1911. He came to the United States for the express purpose of reforming our financial system, and it is hardly possible to understand fully the system in operation today without reference to Paul Warburg. He is a man of very fine mind, a money-maker, but something more—a shrewd student of the systems by which money is made. There are two types engaged in the mere work of money-making which is better described as "money-getting," without reference to production; one type grubs away under whatever system obtains, regarding it as fixed as the solar system; another type is sufficiently detached to see the system as an artifice which may be mended, remodeled or supplanted altogether. Paul Warburg, scion of a long line of German Jewish bankers, is of the latter type. He is not content with the fact that the cash-register fills itself with money; he wants also to know how the cash-register works, and whether it can be worked. He is thus a student of money and of the number of ways in which it can be manipulated.

The Internationalism of Mr. Warburg

PERHAPS it will be best to let him tell his own story as far as he goes. When he told it to the Committee on Banking and Currency of the United States Senate in executive session, there was some dispute as to whether the proceedings should be recorded by the stenographer. It was finally agreed that notes should be made but should not be divulged. The testimony was printed "in confidence" on August 5, 1914, and nominally "made public" on August 12.

The Warburgs are one of the international families whose importance was not realized until the war, and would not have been realized then if their internationalism had not been so apparent. It was an interesting spectacle to see brothers occupying important places of counsel on either side of the great struggle.

Paul Warburg learned the rudiments of banking in his father's bank at Hamburg, Germany, studying the over-sea trade which is the foundation of that city's business. The banking house of Warburg in Hamburg dates from 1796.

"After that I went to England, where I stayed for two years, first in the banking and discount firm of Samuel Montague & Company, and after that I took the opportunity of staying two months in the office of a stockbroker in order to learn that part of the business.

"After that I went to France, where I stayed in a French bank, so that—

The Chairman—"What French bank was that?"

Mr. Warburg—"It is the Russian bank for foreign trade, which has an agency in Paris.

"And after that I went back to Hamburg and worked there again for a year, I think.

"Then I went round to India, China and Japan.

"And then I came to this country for the first time in 1893. I stayed here only a short time then, and went back to Hamburg, and then became a partner of the firm in Hamburg."

The Chairman—"How long were you in Hamburg then in the banking business?"

Mr. Warburg—"Until 1902 . . . . And then I moved over here to this country to become a partner of Kuhn, Loeb & Company."

Ties of Race, Money and Domesticity

"I EXPLAINED in the curriculum which I gave you, Mr. Chairman, that by marriage I am related to members of the firm, the late Mr. Loeb having been my father-in-law, which brought about a desire on the part of the family to bring me over here . . . . I ought to say that I got married in this country in 1895 and

that I have been in this country every year since, for several months . . . . That is the history of my banking education."

It will be recalled that Jacob H. Schiff also married a daughter of Mr. Loeb, so that Mr. Warburg married the sister of Mrs. Jacob H. Schiff. Felix Warburg, Paul's brother, who is also in the firm, married Mr. Schiff's daughter.

Mr. Warburg immediately cast a critical eye upon the state of financial affairs in the United States and it is significant of the grasp he already had on such matters that he found the country rather behind the times.

He conceived the ambition—the very daring ambition—of taking hold of the United States' monetary system and making it what he thought it ought to be.

This alone would make him a remarkable man. It illustrates very well that detached point of view which the Jew is more fitted to take than any other man perhaps. He sees countries and systems with the same freedom from intimate bias with which another man would view assorted fish upon a market stall. Most of the world is engaged in doing its work and indulging its national, racial, domestic and social affections and inclinations; a small minority stands in the background and watches the entire mass at its unconscious maneuvers, and studies it as an observer studies a hive of bees. The man at work has no time except for his job. One man, standing back and studying 1,000 men at work, is able to see how he might utilize their labor or possess himself of a first toll on their production. Doubtless there must be men to stand at a sufficient distance from things to get a correct idea of their interrelationship, and doubtless such an attitude may be made of great service to the race, but doubtless it has also contributed to the selfish manipulation of natural and social processes.

When Mr. Warburg Became a Citizen

MR. WARBURG testified: "When I came here I was at once impressed by the lack of system, by the old-fashioned nature of the system that prevailed here; and I got immediately into one of those periods of high interest rates, where call money went up to 25 and 100 per cent; and I wrote an article on the subject then and there for my own benefit.

> "I was not here three weeks before I was trying to explain to myself the roots of the evil. I showed the article to a few friends but I kept it in my desk, because I did not want to be one of those who try to inform and educate the country after they have been here for a month or so; and I kept that article until the end of 1906, shortly before the panic, when those conditions arose again, and when one newspaper wanted for an issue at the end of the year an article dealing with the conditions in our country.
>
> "Then I took out that article and touched it up and brought it up to date; and that was the first article of mine that was published. It was called, 'Defects and Needs of Our Banking System.' . . . .
>
> "That was, however, the first time that I know of that the question of the discount system and the concentration of reserves was really brought out; and I got a great many encouraging letters asking me to go on and explain my ideas."

Mr. Warburg was perfectly willing to talk to the committee about himself, but not about Kuhn, Loeb & Company, his firm.

"I cannot discuss the affairs of my firm nor my partners," he said, "nor be asked to criticise acts of my partners, either to approve them or in any other way," but eventually he did tell a number of things which students of American financial affairs have considered interesting. Of which more later.

On page 77 of the testimony, more personal matters appear:

Senator Bristow—"When did you become a citizen of the United States, Mr. Warburg?"

Mr. Warburg—"1911. Did I not answer that?"

Senator Bristow—"Perhaps so. Did you intend to become a citizen when you came to the United States in 1902?"

Mr. Warburg—"I had no definite intentions then, because some of the reasons that brought me over here were family reasons; . . . . That had a good deal to do with my first coming here; and I was not sure at all that I would stay here when I came."

Senator Bristow—"When did you decide to become a citizen of the United States?"

Mr. Warburg—"In 1908, when I took out my papers."

Senator Bristow—"When you took our your first papers? You took out your second papers, then, in 1911?"

Mr. Warburg—"Yes."

Senator Bristow—"You made your declaration in 1908; that is when you decided to become an American citizen?"

Mr. Warburg—"Yes."

Senator Bristow—"Why did you wait as long as you did after you came to this country, before deciding to become a citizen of this country?"

Mr. Warburg—"I think that a man that does not come here as an immigrant; a man who has had, if you may call it such, a prominent position in his own country, will not give up his nationality so easily as a man who comes over here knowing that he does not care for his own country at all. I had been a very loyal citizen of my own country; and I think that a man who hesitates in giving up his own nationality and taking a new one, is apt to be more loyal to his new country when he does change his nationality than a man who gives up his old country more lightly."

Senator Bristow—"Yes."

Taking American Finance in Hand

MR. WARBURG—"I may add this: That a thing which had a great deal of influence on my making up my mind to remain in this country and work here, and become a part and parcel of this country, was that monetary reform work, for I felt I had a distinct duty to perform here; and I thought I could do that; and in fact I have been working on it since 1906 or 1907.

"Then I felt that it was the right thing for me to become an American citizen and work here and throw in my lot definitely with this country."

Senator Bristow—"When you became an American citizen; and the motive which induced you to become an American citizen was, then, as I understand it, largely with a view of laboring to bring about a reform of the American monetary system?"

Mr. Warburg—"Well, you put it nearly exclusively on that. I think a man wants to feel that he is going to do some useful work in his country; that he has a mission to perform; and that is what happened to me . . . . Moreover, I had been long enough in this country then to have thoroughly taken root and feel that I was a part and parcel of it."

Senator Bristow—"Yes. When did you first become active in promoting the monetary reforms in the United States?"

Mr. Warburg—"1906."

Senator Bristow—"What was your method of promoting your ideas with regard to monetary reforms?"

Mr. Warburg—"Mainly writing."

Senator Bristow—"Were you connected with the Monetary Commission?"

Mr. Warburg—"No, not directly . . . ."

Senator Bristow—"Were you consulted in regard to the report of the Monetary Commission in any way?"

Mr. Warburg—"Yes, Senator Aldrich consulted with me about details, and I gave him my advice freely."

Senator Bristow—"And in regard to the bill which was prepared by Senator Aldrich in connection with the commission, were you consulted in regard to that?"

Mr. Warburg—"Yes."

Senator Bristow—"What part did you have in the preparation of that bill, directly or indirectly?"

Mr. Warburg—"Well, only that I gave the best advice that I could give."

The Adviser of Senator Aldrich

MOST readers will recall that the name of "Aldrich" was, a few years ago, the synonym for the money power in government. Senator Aldrich was an able man and a tireless worker. His character for thoroughness and industry did more than anything else to disabuse the popular mind of the notion that such men were mere "tools of the money interest," or engaged in their work out of lust for gain, or out of sheer pleasure in legislating against the interests of the people. Senator Aldrich led on tariff and financial matters because he understood them; and he understood them by tireless study of them; and, therefore, he was the master of other men who had not paid the price of knowledge. But, he understood these matters from the standpoint of the business interests only. He was sincerely desirous of the prosperity of the country, but that prosperity was written in banking balances. Fifteen years ago it might not have been possible to judge him thus calmly, because then he represented in the public mind, more than any individual does today, the concentrated power of the financial group. Their prosperity was his first care, probably because he believed that their prosperity was also the country's.

It was such a man, then, that came to Mr. Warburg for advice. The labors of Senator Aldrich comprise many volumes of difficult material and Senator Aldrich's appeal to Mr. Warburg was a very high compliment to the quality of the latter's mind and financial experience—this, of course, assuming that Mr. Warburg's counsel was not forced upon the Aldrich committee by the New York money interests.

In his testimony, Mr. Warburg did not tell all. The omission, however, was supplied by an article in *Leslie's Weekly* in 1916, the author being B. C. Forbes.

It is a story of which *Current Opinion* said: "It reads like the opening in a shilling shocker."

It appears that the conferences between Mr. Warburg and Senator Aldrich took place on an isolated island off the coast of Georgia—Jekyl Island. Included in the party, besides Senator Aldrich and Mr. Warburg, were two New York bankers and the then Assistant Treasurer of the United States. The mysteriousness of it all was well brought out by Mr. Forbes:

Hist! Four Bankers on a Lonely Island

> "PICTURE a party of the nation's greatest bankers stealing out of New York on a private railroad car under cover of darkness, stealthily hieing hundreds of miles south, embarking on a mysterious launch, sneaking out to an island deserted by all but a few servants, living there a full week under such rigid secrecy that the name of not one of them was once mentioned lest the servitors learn their identity and disclose to the world this strangest, most secret episode in the history of American finance.
>
> "The utmost secrecy was enjoined upon all. The public must not glean a hint of what was to be done. Senator Aldrich notified each one to go quietly into a private car which the railroad had received orders to draw up at an unfrequented platform. Drawn blinds balked any peering eyes that might be around. Off the party set. New York's ubiquitous reporters had been foiled. So far so good. After bowling along the railroad hour after hour into southern country, the order was given to prepare to disembark.
>
> "Stepping from the car when the station had been well cleared of travelers, the members of the expedition embarked in a small boat. Silence reigned, for the boatmen must not find out how distinguished were their passengers.
>
> "In due time they drew up at another deserted pier. They were at Jekyl Island, off Georgia. The island was entirely unpeopled save for half a dozen servants.
>
> "'The servants must under no circumstances learn who we are,' cautioned Senator Aldrich.
>
> "'What can we do to fool them?' asked another member of the group. The problem was discussed.
>
> "'I have it,' cried one. 'Let's all call each other by our first names. Don't ever let us mention our last names.'
>
> "It was so agreed.
>
> "The dignified veteran Senator Aldrich, king of Rhode Island and a power second to none in the United States Senate, became just 'Nelson'; . . . . and the quiet, scholarly member of the powerful international banking firm of Kuhn, Loeb & Company, became 'Paul.'
>
> "Nelson had meanwhile confided to Harry, Frank, Paul and Piatt that he was to keep them locked up on Jekyl Island, cut off from the rest of the world, until they had evolved and compiled a scientific currency system for the United States, a system that would embody all that was best in Europe, yet so modeled that it could serve a country measuring thousands where European countries measured only hundreds of miles."

Mr. Forbes does not omit to write this further description of Mr. Warburg's condition at the time:

> "unable then to speak idiomatic English with perfect freedom and without an accent, an alien not naturalized."

Mr. Forbes also wrote—"Here is a German-American, but the sort of one that makes the hyphen look like a badge of honor."

That was in 1916. Hyphens went out of fashion, though not entirely out of use, soon after.

Thus far the story of Paul Warburg.

No Stripes, Few Bars in This Man's Prison

By RAY YARNELL

WEATHER tanned, rugged, healthy, clear-eyed, this man in overalls and jumper and an old shapeless hat, busied himself about a team of horses, hitching them to a plow standing at the end of a half-turned field.

He was middle-aged. No peculiarities marked him. He appeared to be an average type.

He was whistling as he worked.

That man was a convict, an inmate of the Kansas state penitentiary. He came to prison from a farm because he had committed a crime.

No guard was in sight. At night this man did not go to a cell to sleep. His home was in a small house near the barn, comfortably furnished. He ate his meals there. No high stone walls penned him in.

Out in the field at work he did not feel the oppression of prison environment. Mentally he was back at home on the farm as he had been before he surrendered to a weakness which no one in his community had helped him resist.

Back of that prisoner at the plow, back of his whistle, back of the content reflected in his face, back of his freedom from supervision, I felt there must be a story, so I went to J. K. Codding, warden of the Kansas prison, and asked him to tell me about farmers he had met in jail.

Warden Codding is six feet tall. He is wide in proportion. He is a big man, with a big man's voice, a big man's smile and a big man's heart. There are no stripes in Codding's prison, few cells have barred doors and guns are seldom seen. A prisoner guards the steel door admitting to the office; another stands at the barred gate leading to the prison yard. Prisoners were at work and other prisoners were their foremen. Only in the wall towers could guards be distinguished.

J. K. CODDING

A man convicted of murder was seated in the warden's office alone, waiting for a hearing on his application for parole.

Through that environment Warden Codding led me to his private office upstairs in the prison office building and began talking about farmers he had met in jail.

Only 15 prisoners out of every 100 come from the farms. That is the outstanding fact discovered by Mr. Codding during the 12 years he has been warden of a penitentiary. It has been verified from prison statistics in other middle-western states. Eighty-five per cent of the criminals come from the cities and small towns despite the fact that the rural and urban populations are practically equal, in some agricultural states rural population being 10 per cent greater.

But one conclusion is possible: American farmers are more law-abiding, possess greater moral stamina than men in the cities and they live in an environment where criminal suggestion comes less frequently. They are accidental rather than natural criminals.

Naturally in sympathy with agriculture, himself the owner of a small farm and a herd of purebred Jersey cattle, Warden Codding has, perhaps more than any other prison official in the United States, studied the problem of rural crime. And by rural crime, in the bigger way, Warden Codding means both crimes committed by actual farmers and by persons living in the small towns in a strictly rural community.

It is in an effort to prevent crime, particularly rural crime, in Kansas, that much time will be devoted by Mr. Codding in the future. He has resigned as warden of the Kansas penitentiary and has taken up the practice of law in Leavenworth. Particularly he will seek to keep in touch with men as they come from prison to advise them and direct them.

"That is a wonderful field, preserving remade men," he said. "I have done my bit inside the prison in remaking them but I have found few men to take hold when I turned them out. There are some. I want to be one. If ever a prisoner needs a friend it is in the hour when he passes through the barred gate and out of the penitentiary. Inside he has been protected from himself and from bad associates. The state has been his friend.

"Once outside that barred gate it is a sad fact that the state no longer is his friend. The state forgets as the door clangs shut. The public is cold. Opportunities are few to make a decent living. Human friendship for a released prisoner very often exists only in the dangerous environment which made him a criminal and he seeks it there. I want to help stop that. I want to do something to prevent crime. I particularly wish to assist in preventing rural crime because I believe that most of it can be prevented, perhaps easier than city crime can be controlled."

Analysis of farmers in the Kansas penitentiary during 12 years has revealed these interesting facts:

The farmer is a one-crime man. He does not repeat. Once a farmer prisoner is released, penitentiary authorities do not count on his return.

Most prisoners from the farm are middle-aged, and are uneducated. They are mental or physical defectives.

Tenants and laborers, not farm owners, are in the majority. They make up the transient element of the rural population, the class to which defectives always drift because their handicap forces them there.

Farmers commit crimes of violence as frequently as city men. Arguments over line fences often lead to killings. Crimes against chastity are relatively numerous. Laws protecting property are often broken. Farmers do not steal motor cars or women, most often done by youths, but they do steal cattle and chickens.

The farm criminal is not vicious. Life out of doors has not taught him the brutal things the city criminal learns in alleys, saloons and dives. Vice has not left its degenerate mark on him.

Farmers who go to jail are healthier than other prisoners. Physically they are superior men, stronger, more able to work and to resist disease.

They are the better type of prisoners. Seldom does one attempt to escape although the opportunity to do so comes frequently. They are plain, hard working fellows, well behaved.

A majority of the women who come to prison from farms are convicted of immoral crimes. Their number is not large. Like the men they are uneducated and often feebleminded.

There are more defectives among farmers than is generally supposed. They are widely scattered, hence not so noticeable as in the city where they tend to collect in groups. But the menace is real, serious, and should be combated.

Through this analysis Warden Codding sought to isolate the causes and conditions which led farmers to become criminals that he might work intelligently in removing them.

"Theory isn't going to do us or our defective citizens any good," Warden Codding leaned forward earnestly as he spoke. "We can dream forever and not help a single man resist temptation nor protect him from criminal suggestion. We need action.

"All over the Middle West the American Farm Bureau Federation, working with the national Government, is building up farm bureaus and placing county agents in charge. The work of these agents consists of getting farmers to use better methods, suggesting the most profitable crops, advising remedies for diseases that attack crops or livestock, urging preventive measures that will halt disease and control pests. Their work is constructive; their aim is to guard against losses from pests and disease in advance.

"What every middle-western state needs is county agents for defectives. We should send into every rural community a man who will work with physically and mentally defective persons as county farm agents work with crops and livestock. Their task would be to seek out and salvage the wreckage of humanity that comes to their community; to direct and protect the feebleminded; to counteract evil suggestions that come to those persons who lack resistance or who know no better than to acquiesce.

"Through such agents defectives and feebleminded persons could be controlled as pests and diseases are now controlled by the work of county farm agents. They would be welfare workers.

"And because these county agents for defectives do not now exist there are hundreds of farmers in prison who should not be there, who easily could have been kept out. The state is spending much money to remake these men. It could have saved them at first for much less.

"Crime in rural districts already is low as compared with the cities but it should be lower. Out in the clean, wholesome country, there should be no crime."

One of the most potent factors in crime prevention, Warden Codding declared, is improved educational facilities. Rural schools are the weakest link in the nation's educational system. They have driven many farm families of the better sort to towns so their children could be given every advantage. Improved schools, he said, will accomplish three things: Prevent crime, keep farmers on the farms and bring back to the farms many of those who have gone to the cities.

Most farmers in jail are uneducated; they are mentally at a disadvantage with their fellows, therefore more susceptible to temptation when opportunity to break a law comes their way. Better schools would raise the standard of rural citizenship and bring more respect for law. Education always is a barrier against criminal suggestion.

"A hopeful thing to me," said Warden Codding, "is the increasing interest in better rural schools. Consolidation is a great step forward. Rural high schools will keep many a farm boy from looking at the world through bars and seeing it distorted.

In the cities are the centers of vice and crime as we know them best but they are also in the country. It is those centers that should be attacked. They spew out the tainted men and women who fill our jails, after they have been infected and become morally diseased.

"Not so many years ago, when the old-fashioned doctor was called to care for a typhoid fever patient, after administering the necessary medicine, he would turn to the mother and say:

"'It's typhoid. You had better prepare for several more cases.'

"That isn't true of the modern doctor. He, too, prescribes a medicine, but instead of making preparations in expectation that other members of the family will become ill, the modern doctor begins a search for the seat of infection. He examines the well and studies the sanitary conditions in the home. Usually he discovers the source of infection and removes it.

"That is the method cities and rural communities should use in combating crime. It is time that we removed these centers of criminal infection. Today we are doing practically nothing. We can strive to correct here in the penitentiary after the harm is done, but it will be a never-ending task so long as the diseased spots are permitted to exist."

Out on the farms, where everything naturally works against crime, where associations are clean and where health is found, there Warden Codding would begin his work of crime prevention. Crime there already is infrequent, broadly speaking. Results can be obtained quickly. With a crime-free environment waiting, the prisons will have a safe place to send their remade men—a place where temptation will not be constant, where men can get a new start, where old associates will not drag down the man who has been given a fresh impetus to live clean.

"The man on the farm is a skilled workman," continued Warden Codding, "one of the most skilled. He commands the remuneration of skilled effort. But if he goes to the city he is only an unskilled laborer, thrown among the floaters, the loafers and the occasional workers. He has nothing to barter but the strength of his hands and his back. He lives among the lowest class of people in the cheap boarding houses. He pals with men on the bottom of the human heap where discontent rules and crime flourishes. He meets lawbreakers and is lead into stealing and immorality. He finally graduates into the position of playing second fiddle to the city criminal. The skill that was his as a farmer counts for nothing.

"Quickly to farm boys and girls who move to the cities comes trouble. They are unsophisticated and trusting and there are hundreds waiting to take advantage of their innocence. They don't know the paths that lead to evil and they are easily influenced. Out of their element, they are at a disadvantage. Often they pay the penalty for the crime committed by the more astute and clever city criminals.

Seventy-five per cent of the farmers who are sent to the Kansas penitentiary are given farm work to do. Their acquaintance with cells and the prison yard is made as brief as possible. Warden Codding sought to prevent them from learning viciousness from more hardened criminals from the cities.

Men have come to Leavenworth who merely passed through the prison to be checked in. They did not even spend a night within the walls. Instead of in a cell they slept in a bunk house on the prison farm. One man went directly from the warden's office to the pumping plant, located a mile away on the river bank. He was out of sight of the high stone walls and guard towers. That man has seen the penitentiary but once—the day he checked in. Since then he has remained at the pump house. His food and clothes have been taken to him. He has escaped entirely the curse of the prison environment.

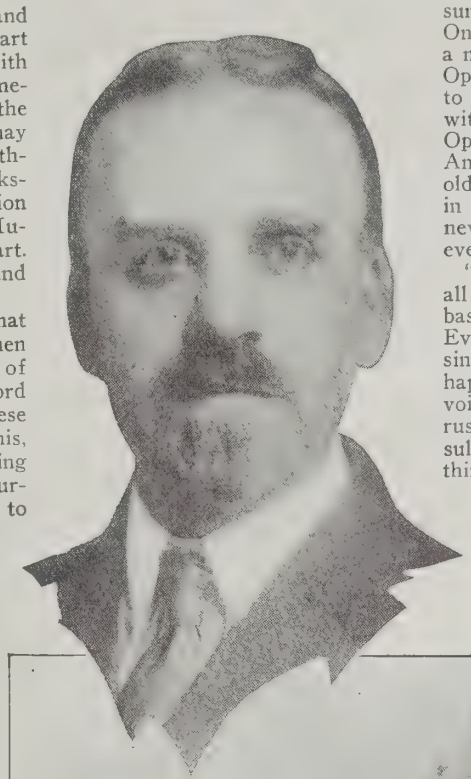
Out in the fields, working with the cows and horses and hogs, farm prisoners are content. They thrive. They are doing the things they know how to do, but most of all the portion of freedom accorded them keeps their mental attitude toward life in focus. They know they are being punished but they also realize it is a constructive punishment. "That is why," Warden Codding says, "none ever returns."

On the Kansas prison farm is a rapidly developing herd of purebred Holstein cattle in which inmates are very deeply interested. Year by year a fine herd of purebred hogs is being built up. The prison is handicapped for funds to do this work but it is progressing, nevertheless. Prisoners in charge are as proud of these cows and hogs as the warden himself, through whose efforts a start was made.

On this farm also women, both from the cities and the farms, are given outdoor work. They care for the gardens and some growing crops and chickens. They are kept out of doors so their health may be built up. The prison aims to turn out into society no person who is ill or who will have to overcome a physical disadvantage to make good. Sometimes it happens that such a person is released because correction is not always accomplished before a sentence expires.

Much food, milk, vegetables, meat and grain, used for prison fare, are produced on the farm. All prisoners are given food in liberal quantities—good, nourishing food. That is the basis of the process Codding uses to remake men.

Singing Is a Municipal Project in St. Paul



Choruses a Desirable Civic Asset Experience of One City Proves; No Room, Thousands Turned Away From Affairs Staged Recently

By EARL CHRISTMAS

SINGING is a desirable civic asset. At least, that is the illuminating experience of St. Paul, Minnesota, where the taxpayers are spending good, hard dollars to encourage it. Singing, in the Minnesota city, is a municipal project, supported by city funds and directed by city officials, the same as the public schools or the workhouse.

This unusual municipal activity functions through the Municipal Chorus, the first chorus in the country organized and supported by a city. The project was started two years ago, and now, with the growth of the organization as a public institution, officials in St. Paul are convinced that the promotion of singing pays dividends. Singing is just as necessary as the parks, in St. Paul, and it has a place in the budget almost as securely.

Indeed, the Municipal Chorus in St. Paul has become a public institution. It has come to stand for the city much as a fine orchestra may stand for another city musically. It has a part in every patriotic celebration along with the mayor of the city and other time-honored institutions demanded for the observance of any public event. It may be the celebration of Washington's birthday, or Memorial Day, perhaps a Thanksgiving festival, or whatever the occasion of civic or community interest, the Municipal Chorus is sure to have a part. The people have come to expect it, and they like it.

Men and women like to sing. That was one of the convictions of the men who organized the chorus. So, one of the objects of the chorus was to afford an opportunity of expression to these men and women who like to sing. This, the chorus has done, in ever-increasing measure, but more than that, it has furnished good musical entertainment to thousands of men and women in St. Paul. Free concerts and entertainments are given from time to time, and if you wish to know the place the Municipal Chorus holds in the community you need only try to get into the auditorium for one of these performances.

Take the presentation of "The Bohemian Girl," for instance. Crowds packed the street in front of the auditorium for a block when the last seat had been taken. Between 5,000 and 10,000 persons tried in vain to crowd into the auditorium for that performance. And the auditorium is not a small building, the theater portion set for the opera holding some 4,000 people.

Indeed, the crowds attracted by the performances have constituted the one obstacle in the promotion of the chorus, according to James M. Clancy, commissioner of parks and playgrounds, under whose department the work of the chorus comes. Increasing the number of performances of each concert has tended to obviate some of the difficulty, but even so, the Municipal Chorus has found itself at times beset with too much popularity.

Pre-eminently a public institution, the chorus is unique in that it admits into its ranks all who come knocking at its doors, be they grand opera singers or persons who never had a day of voice training in their lives.

"We have no voice test for admission," said Gus B. Wollan, organizer and president of the chorus. "Any one who wishes to sing is free to come and join with us.

Above—G. B. WOLLAN, who organized, in St. Paul, the first chorus supported by a city. Below—This picture, taken on the steps of the Minnesota state capitol during a holiday observance, is symbolic of the Municipal Chorus as a public institution. The chorus aids in the celebration of every holiday and has a part in nearly all public observances in St. Paul.

"You know, people like to sing. Some of them never had an opportunity to get any training, and here is a chorus where they can start out on an equality with men and women who have been trained in grand opera. So, they jump at the chance.

"Only a very small per cent of those joining the chorus have had special voice training. Some who come have little ability to sing, but we never turn anyone away. To one who likes to sing, there is pleasure in taking part in chorus work of this kind. A great many came at first who couldn't sing, but those who can't sing usually drop out. You see, those who can sing are the ones who get the greater enjoyment out of their work, and they are the persons who will stick through the year. But anyway, we never turn any one away. That is one of the objects of the chorus, to give an opportunity of expression to every man, woman or child who likes to sing. So, however poor may be the efforts of any member, he is never turned away from the chorus.

"The singer gets enjoyment out of the work, even if others may not benefit so much. To many, the chorus may be the only means of recreation, and we don't want to deny this means of expression to anyone. Rather we have tried to encourage all who like to sing to join the chorus.

"However, those who can't sing so well usually do not remain in the chorus so long, and the chorus has been able to obtain some unusually fine results.

"We have singers of almost every graduation of ability in the chorus, suggestive of the popular appeal of the organization. We have five members who have sung in grand opera choruses. One member of the chorus was a member of the Chicago Grand Opera Company before coming to St. Paul, and another was with the Metropolitan Grand Opera Company in New York. Another was a member of the old Boston Ideals. Others sang in church choirs, and some never had any training whatever.

"But here in the chorus, they all get together on a common basis, and they all enjoy it. Even the former grand opera singers, though accustomed perhaps to more finely trained voices of the professional chorus, like the work and the results. They marvel at the things our director is able to accomplish, taking a mixed group of varying capacities this way, and so they enter whole-heartedly into the work, helping along where they can those who are just learning to sing. Incidentally, we have in the chorus men and women who are getting their first lessons in singing.

"You can't imagine how much people like to sing unless you have had an experience with a public chorus of this kind. We have one Civil War veteran in the chorus. He is 72 years old, but he is just as enthusiastic as the girl of 16, who represents the other extreme. In several cases, husbands and wives are members of the chorus. In quite a number of instances, mothers and their daughters and fathers and their sons belong to the chorus. Nearly half of the women in the chorus are married women, and most of them are women with children. So great is the interest in the work, that the chorus keeps up its rehearsals even through the summer months. When other activities lagged or stopped with the coming of hot weather, the members of the chorus objected to stopping the weekly rehearsals or holding them less frequently.

"Besides affording opportunity of expression to singers, and entertainment in a musical way for the public, the chorus is worth while as a municipal project in that it helps materially to elevate musical standards. We gave three performances of Handel's 'The Messiah,' which competent musical critics rated as the best ever given in the Northwest.

"The chorus has given other performances that one might not expect from a public chorus of this kind. We gave one performance of Haydn's Oratorio 'The Creation,' and another of Cowen's 'The Rose Maiden.' We gave Balfe's 'The Bohemian Girl,' in full costume and with all the parts taken by members of the chorus. Even all the solo parts were taken by members of the chorus. We had a former actor for a stage director, and everything went off like a professional performance.

"Well, the night that performance was given, the auditorium didn't have a chance when it came to holding the crowds. Between 5,000 and 10,000 persons were turned away. Now, we endeavor to arrange for several performances of any given entertainment, so that fewer people will be disappointed." The Municipal Chorus was organized in January, 1919, Mr. Wollan, then secretary to Mayor L. C. Hodgson, and Leopold Bruenner, present director of the chorus, being the leaders in its formation.

"I had had the plan in mind for several years," Mr. Wollan said. "For a long time, I had felt the need of some organization, in which persons could express themselves in song, some place where they could go and sing even if they never had had any training. So the idea struck me that here is a proper function for a city to undertake.

"I talked the matter over with Mr. Bruenner, and we decided to go to Mr. Clancy. The city commissioner was enthusiastic about the plan. So everything was easy. We found that lots of people want to sing—we never have had less than 150 in the chorus—and large numbers wished to hear them.

"The chorus was organized in January. In five weeks, this group of mixed voices had been worked into a chorus and the first performance given. We have kept up the pace since that time. As soon as one entertainment is completed, the members are eager to start another.

"The St. Paul chorus was the first and, I am advised, still is the only chorus in the country supported municipally. But it is more than an experiment. We have found it exceedingly worth while both to the singers and to the public. I am sure that other choruses of the kind will spring up over the country, as cities begin to appreciate the value of music as a civic asset. We teach it in the public schools. Why not give the people out of the schools a chance to sing, and those who like an opportunity to hear them? There's nothing like a good, old singing bee for those who really like to sing."

Entertainments, of the Municipal Chorus, announced under the auspices of the St. Paul Department of Parks and Playgrounds, always attract big crowds. Newspapers give generous space to the events, and thousands gather for the free music festivals. The entertainment may be an oratorio, or it may be a light opera. Again, it may be some holiday festival, in which the Municipal Chorus takes a part, or a free concert in a park.

Frequently, the entertainment given by the chorus is augmented by a special orchestra, made up of members of the Minneapolis Symphony Orchestra, who are glad to join in the presentation of better music to the public at these free entertainments. Music for the public by the public might characterize the work that the Municipal Chorus is doing.

All expenses of the Municipal Chorus, including the salary of the director and like items of expense, are paid out of a special fund voted each year by the city council.

"We feel that the Municipal Chorus is essentially a public institution," said Commissioner Clancy. "And we feel it is necessary, just as the parks are necessary. A city must provide for the recreation of its people if it is to perform its full duty, and music is one of the best ways. The chorus provides enjoyment for those who sing, and entertainment for the thousands who hear it yearly. Our only trouble has been that we can't take care of the crowds. But then, that only proves the value of such a chorus to the people of a wide-awake city."

Putting the Little Red Schoolhouse Into the Constitution

By HARRY H. DUNN

FOR nearly 150 years, the "little red schoolhouse" has been the national building of the United States. Out of it have come patriots and presidents, bankers and bank-wreckers, chorus girls and stars, suffragettes and antis, and all the rest of all the varieties of American manhood and womanhood that make life worth living for us ordinary folk—most of us also having come from the same l. r. s., these being the only letters we are entitled to wear behind our names. Up to date we have been content to allow legislatures, county supervisors and town aldermen, by and with the advice and consent of the well-known school board, to attend to the education of our young ideas. Hitherto, this system has proved so efficient that our public schools are the admiration of the remainder of the civilized world, as well as the hope of our own future as a people and as a nation—two vastly different futures, by the way.

But one state has decided to go a step further than this, and to make the educational system of the state a part of the organic law, in order to take the whole school organization out of politics; to distribute the funds appropriated for educational purposes more equably, and to centralize authority and methods, to a certain extent, in one state-wide organization. The state is Louisiana, whose new constitution, when it is completed, bids fair to be as long as both the two under which it is now operating, and the sixty or more amendments to these organic laws. In spite of its length, however, and the 143 men and three women thought necessary to write it at Baton Rouge, several pages will be taken up with the public school system, with explicit directions as to its organization and operation. While this seems to be legislation, rather than the customary direction for legislation, such as usually written into state constitutions, it has met with the approval of virtually all the educators of the state, and was prepared by a special educational committee, composed of those delegates to the state constitutional convention most closely connected with the educational work of the state.

In brief, the educational article of the new constitution of Louisiana provides for the co-ordination and unification of the public school system of the state, commencing with a state board of education, partially elective and partially appointive by the governor, and running on down to the district school boards in the various parishes. While this new school system will be apart from the bodies which will direct Louisiana State University and the large state agricultural college, for which provision has been made in the new constitution, it will be closely connected with these boards, and will work with them, to the end that a greater number of graduates of the public grammar schools, high schools and junior high schools—when these last-named are established—continue their education either in the state university or through the specialized courses of the agricultural college.

Supervisory powers over private schools, operating on a grade basis, are given to the state board of education in furthering the general plan of co-ordination and unification of the entire educational advantages and opportunities offered by the state. These private schools, both secular and otherwise, seem to have accepted the new plan and to have approved its incorporation into the organic law, to be a permanent arrangement, rather than one which can be altered each year by the state legislature. Discussing the new and untried plan of "constitutional education," Wilbur J. Black, a delegate to the constitutional convention from New Iberia, and chairman of the educational committee which drafted the educational article for the constitution, said:

"The committee on public education has presented a schedule which purports to unify and co-ordinate the entire educational system of the state, beginning with the first-grade pupil and ending with the finished product of the state university, meanwhile taking the entire system out of politics.

"To these ends, the new article of the constitution co-ordinates the various elements of the educational system under the general supervision of a state board of education, but at the same time seeks to evade and avoid too great centralization of authority even in that board. Beginning with the Louisiana State University, the supervision of this state board over this, the highest of our state educational institutions, is merely general, the close direction of the destinies of the university being placed in the hands of an administrative board.

"The superintendence of the secondary educational institutions of the state—of which there are eight, headed by the state normal school—is, however, placed directly in the hands of the new state board of education. This is accomplished by vesting in the board the power to appoint the governing bodies of these institutions, and to allocate to each the proportion of the gross fund given by the state for their maintenance. Each of these institutions has been conducted—of necessity—as though it were a separate institution, and not a part of the educational system of the whole state. Through this condition, each was brought, biennially, in bitter competition with other member schools of the secondary system in a scramble for needed legislative financial appropriations. Under the new system all will be brought together in co-ordinated work under the administrative charge of special boards, but with all these boards under direct supervision of centralized authority, and with proper and just division of all available funds to each.

"While it was deemed essential to approach centralization of authority with reference to the higher institutions mentioned, there is a recession in regard to parish (that is, county) school boards. If the state superintendent of education, or the state board of education, had the authority to dominate the parish school boards and superintendents, he, or it, would have the power to move an army, political or otherwise, composed of hundreds of officials and thousands of teachers, each dependent upon the central authority for his or her very livelihood. To make certain that no such condition might ever arise, the state board of education was given supervision over the purely educational features, methods of study, gradings, books used, and so on, but never to be vested with control of the administrative or financial affairs of the parish board or its personnel.

"The first steps in the progress of the present educational system of the state were slow, because there were not always available men qualified to lead in local educational work. Parish superintendents were appointed without regard to qualifications, and boards had as great political as educational qualifications. The first exercise of a centralized authority over parish boards, however, enabled the administration of Governor Blanchard later on to force the raising of the standards of parish superintendents and of the personnel of the parish boards. Wherever reluctance to advance appeared, the reluctant ones were removed. This was a beneficent use of centralized power and has resulted in placing the educational system on a higher plane than ever before in Louisiana. This exercise of power for good, however, also warns that it may be equally powerful for bad, and we believe it is safer to let control of the local schools rest in local hands, subject to the supervision of the educational features by the state board of education.

"Under the new article in the constitution, the state board of education is to be composed of one member elected from each of the eleven congressional districts, for overlapping terms of eight years, one to be elected every two years—with three additional members to be appointed by the governor of the state. The purpose is to obtain for the board not only men trained in general educational matters, but men familiar with local educational conditions in all parts of the state as well. This board will be responsible for its acts to the governor, and to the people—at the elections—and will prevent the state board of education ever becoming a machine in the hands of any governor."

(C) Gilliams Service.

The beautiful heroic statue to Simon Bolivar, the South American Liberator, recently unveiled in Central Park, New York. The statue was presented to the United States by Venezuela and was accepted by President Harding in the name of the nation. The President considered the event of such great importance that he attended the unveiling in person and delivered a long address. The statue is the work of an American woman, Sally J. Farnham, and is the largest sculpture in the world executed by a woman. Artists have pronounced it to be exceptionally fine. It cost $55,000.

The Pro-Truth Campaign

IN AN article published in this journal, April 30, 1921, Professor Arvid Reuterdahl presented definite evidence proving the similarity between the work of the unknown scientist "Kinertia" and the much-advertised Einsteinian Theory of Relativity. The similarity is so pronounced that any fair-minded person at once must wonder if the alleged contributions of Dr. Einstein rest upon borrowed foundations. It is a fact that "Kinertia's" work antedates that of Einstein. It is difficult to prove a direct charge of plagiarism. This is particularly true whenever the person involved is surrounded by a veritable host of protectors who refuse to permit an honest investigation.

Professor Reuterdahl's reply to his critics follows in part:

In the case of "Kinertia" Versus Einstein the present writer did not state that Einstein is a plagiarist. To make such a bald statement one must have indisputable proofs. I did state and again repeat the statement: "If Einstein was aware of 'Kinertia's' discovery then the appellation 'plagiarist,' bestowed upon him by his German professional colleagues, is eminently fitting. If, on the contrary, Einstein was unaware of this work, then he is, nevertheless, antedated by the work of 'Kinertia'. Einstein is at liberty to choose either horn of the dilemma."

Referring to an editorial criticism in the *Scientific American* of May 14, Professor Reuterdahl continues: "The *Scientific American* is particularly disturbed by my article entitled "'Kinertia' Versus Einstein." On the cover of this issue the following question appeared in bold type "Is Einstein a Plagiarist?" In reference to this question the *Scientific American* states: "It will be at once understood that according to Professor Reuterdahl he is." What I actually stated in my article has been again recorded above in order to refresh the memory of the editorial writer. After this perversion of truth a subtle atmosphere is created in order to link, by contrastive suggestion, both the present writer and THE DEARBORN INDEPENDENT with the ambitions of the former Kaiser of Germany. A diversion is thereby adroitly produced which removes the reader's attention from the actual question in hand, that is, "'Kinertia' Versus Einstein," to an entirely different issue. Moreover, another irrelevant issue is deftly imposed, that is, anti-Semitism.

The present writer emphatically denies and resents both insinuations created in this questionable manner. I am a loyal citizen of the United States. I was born in Sweden. I came to the United States when I was six and a half years of age. Furthermore, the allegation, also by innuendo, that my attack upon the theories of Einstein are due to anti-Semitic feeling, I brand as a gross misrepresentation.

The *Scientific American* editorial then becomes a plea for Professor Einstein's mathematical product. There seems to be urgent need to show that although Einstein has benefited by "ideas which have had a rather nebulous existence before him" nevertheless in the hands of this master craftsman they have been mathematically welded into a "crowning achievement" which "has never been approached or approximated in any way."

Suppose, for the sake of argument, that we grant that this concession in no way affects the real issue which we may state in the form of a question: Has Einstein given proper credit to the creators of the "nebulous ideas" which he used in constructing this supreme masterpiece of the human intellect? We are not aware that he has ever referred to their humble contributions to his stupendous structure. It seems that he has ruthlessly discarded the scaffolding which he used in building his edifice without paying for its use. Do we find the name of Dr. J. H. Ziegler mentioned in any of his writings? Is there any reference to the contributions of "Kinertia"? Has he ever answered the charges made by Engineer Rudolph Mewes, Professors E. Gehrke and Paul Weyland that he appropriated a formula which appeared in a work published by the late Professor Gerber in the year, 1898? If perchance Professor Einstein should plead ignorance of these contributions at the time when he developed his mathematical analysis, then we demand that he publicly admit their previous existence and definite worth. It remains to be seen if Dr. Einstein will even condescend to comply with this eminently just demand. We trust that we may be permitted to state that what we have granted in the above, for the sake of argument, we do not admit as an actual fact. The writer is prepared to show that Einsteinism is a pernicious fallacy.

The climax of the extraordinary editorial is in keeping with the intent of the entire outburst. Vereschagin, the great Russian painter, could not have depicted the closing scene with more telling finesse and skill. In the foreground of the picture we see the vultures flying about picking the Einsteinian bones. These carrion birds are the "small fry" of science "whose names will be forgotten fifty years from now." In the background we see the Golden Sun of Relativity rising above the horizon and casting its brilliant rays over this field of iniquity.

We trust that if we presume to draw another picture descriptive of conditions five years from now, we will not be charged with undue lack of scientific piety.

In the foreground of our canvas we see the black ocean of Relativistic Despair stretching gloomily to the abyss-like boundaries of finite but unlimited space. In the background behold the lurid setting Sun of Einsteinism disappearing below the horizon, and casting gruesome shadows over the Island of Ignorance and the Ruins of Relativity while the somber mourners, Inconsistency, Chaos, and Skepticism, simultaneously and yet separately await the approach of Eternal Night

Law Enforcement and the Eighteenth Amendment

By ELLIS MEREDITH

THERE are a great many people in this country who are much concerned over the non-enforcement of the Eighteenth Amendment. Part of them are saying "I-told-you-so" with a satisfaction that quite outweighs any regret they may feel, while others intimate that they are surprised and disappointed at the failure of the government to carry out the provisions of the Volstead Act. All of them agree that any law which remains unenforced breeds contempt for all laws. They point to open defiances and secret evasions of the Volstead Act and argue plausibly enough that the number shows the law is not in harmony with the public mind, and since democracies are supposed to be governed by the collective will of the nation, they insist that Columbia be given an opportunity to exercise the feminine right to change her mind.

There has not been quite so much insistence on submitting the Eighteenth Amendment to popular vote since Columbia's daughters have been enfranchised, but there is a persistent and ingeniously insidious campaign going on for the revision, if not the repeal, of the Volstead Act.

The district attorney of New York confesses his inability to enforce the law; a prosecuting attorney in Pennsylvania justified his failure to prosecute by declaring that juries refused to convict. Florida authorities say they cannot prevent the illicit contraband coming in from the Bahamas and Cuba. The states bordering on Mexico which were "dry" by their own vote before the adoption of the amendment, wail over the bootlegging Mexicans, and to listen to the chorus, one might infer that most of Canada was sopping wet instead of bone dry.

And the conclusion of the whole matter, with about ninety per cent of the chorus, is that voiced by the eminently respectable Washington *Post*, which says, with the air that proclaims that patience has ceased to be a virtue:

"It is obvious that in order to secure respectful obedience to the Volstead Act the act must be modified to conform to public sentiment."

Just so, but before starting in to modify the act, suppose we consider this whole question of laws and their enforcement, because there is a vast quantity of evidence to be sifted before arriving at the decision that laws which are not enforced should be modified or repealed.

All countries with sufficient civilization to have left any vestiges of history behind them have had laws governing certain things. Barbarians have customs which serve them as laws, and from Cain down to date there have been laws against murder and providing for its punishment. And yet murders have been committed in all ages and places. They are still committed with frightful frequency and in some American cities, notably New York and Chicago, the prosecuting attorneys do not seem able to do much to enforce the laws.

Shall we modify our laws against murder?

"Lynch" law isn't law at all, but mob rule, and the whole country denounces and deplores it and views with alarm its dreadful record, but in the last thirty-two years nearly 3,500 men and women have been lynched in this land of the free, nearly 3,000 of them in the South and fifty of them were colored women and eleven were white women. Sixty-three Negroes, five of them women and five white men were lynched by mobs in 1918, and "in no case was any member of the mobs convicted in any court, and in only two instances were trials held and in both of these instances the mob members were acquitted," says the Philadelphia *Public Ledger*.

Police and constables cannot arrest the mobs; attorneys cannot convict the ringleaders, because juries are in sympathy with them. Shall we throw up our hands and let the mobs pursue the furious tenor of their way?

Take the traffic regulations. Last year more than 10,000 persons were killed by automobiles. The speed limits range all the way from eight miles in Cimmaron, Kansas, to fifteen and twenty miles in some of the big eastern cities, and they are only indifferently observed beyond the range of the traffic cop. The record shows that "five persons were killed in traffic accidents on Washington streets during February, one was seriously injured and 101 received minor injuries." Apparently speed regulations are also violated "without the slightest sense of moral turpitude," yet the Washington *Post* did not echo its own pronouncement on the Volstead Act which is much in point.

"Even with state laws in effect and state officers actively engaged in the chase for offenders, the controlling factor in the situation, the lack of respect for the law, remains."

What is going to happen? Let us comfort ourselves with the cheering thought that if every house has its own distillery there will be no call for bootlegging, and if the blind tiger is able to establish lairs wherever it will, distilleries in the home will not flourish. One of these days the supply will be exhausted. Nothing is a better deterrent than lacking the price of vice, and as the cost of a drink reaches prohibitive proportions, prohibition will begin to prohibit.

When women are eligible for jury duty it will not be so hard to get convictions, and when we grasp the big idea and arrest the man who buys, as well as the man who sells contraband goods, we shall be on the highway to actual enforcement. The judge who sends a man to jail until he tells where he got his liquor will have found the fire that will burn the stick until the stick begins to beat the dog and the dog begins to bite the pig, and the squeals of the animal will make it easy to find him, and perhaps his owners.

Golden Rule Does Pay—Ask This Chap

By RAY YARNELL

APPLIED sociology, an application of the Golden Rule in business by a foreigner who has adopted the United States as his country and who is striving to build it up, is working a transformation in Allen County, Kansas.

The thing B. K. Baghdigian, of Iola, is doing is radical because it is unusual; it is revolutionary because it is practical and works. The theory at the bottom of it has been changed to fact.

Baghdigian did his first work in Southeastern Kansas in the mine fields where there is a large foreign element. There he served his apprenticeship in the newspaper business, studying conditions, becoming acquainted with the people and the country and getting the point of view of Kansans and Americans. That preparation and study fitted him for the job he is now putting over.

It is peculiar that a man of Baghdigian's type did not go into educational work or remain in the newspaper game as both hold an opportunity for service that seems to appeal to him, as well as offering a pleasant and fairly good living.

B. K. BAGHDIGIAN

But this man from the other side of the Atlantic saw a yawning gap between two classes of folks in Kansas, a gap that promised to become wider and which was causing a loss to both, because it blocked any community of interest or any co-operative effort for the benefit of all. It is that gap which Baghdigian is bridging.

In Allen County he has flung the girders of a bridge across the gap and they are firmly bedded on either side. Now he is adding the superstructure, stringing the supporting cables and laying the floor planks. Across that bridge he hopes to see pass a steady stream of traffic, a traffic in understanding and sympathetic co-operation, a traffic that will be a twentieth century interpretation of the Golden Rule.

Lack of understanding, Baghdigian found existed between farmers and business men. The farmer was suspicious of the merchant. He felt that the merchant lost no opportunity to exact excessive profits for all the luxuries and most of the necessities. This belief was to some extent fostered by agitators and politicians. Mail order catalogs, many of them quoting lower prices than those asked by the local merchant, were textbooks to this misunderstanding. The farmer did not stop to consider that the goods he bought sight unseen might be of inferior quality to those bought from his home town merchant to whom he could go direct in event he was not satisfied.

The farmer did not understand the business man and the business man had little conception of the problems of the farmer. And the unfortunate thing about it was that neither tried to overcome this misunderstanding. The merchant gave little thought to the farmer and the attitude was mutual. Suspicion thrived and became fixed.

That situation is not unusual in the great agricultural region although in recent years many attempts have been made to change it. Baghdigian found it so when he was invited to become the secretary of the chamber of commerce of Iola. But he grasped the opportunity as one which gave him a chance to try out his theory of applied sociology in business. So he took the job.

That's how the thing that has been done in Allen County started. Here is the story of what has been done and how it was accomplished.

Somewhere a start had to be made. It was a case of finding the weakest point in the armor and striking there. So Baghdigian worked quietly and through other men and finally persuaded the county commissioners to vote $2,000 toward the support of the Allen County Farm Bureau. A county agent was obtained—an expert on live stock. That was bull's-eye number one for Baghdigian because further along in his plan that knowledge of live stock was to be used liberally.

Previous to the coming of the county agent, however, the chamber of commerce brought into the county a representative of a cream separator company and a railroad agricultural agent. Both were experts in dairying. They lectured in schoolhouses, telling the farmers of the advantages of dairying and its possibilities financially and in building up the fertility of the soil.

So far the work done had been exclusively among the farmers. But now comes Baghdigian's theory of a practical application of the Golden Rule in business. He felt that the business men should understand the problems of dairying and farming before he could expect their support in the project he had in mind. So he brought to Iola, the county seat, an extension school in dairying and home problems. The business men, however, did not turn out to the meetings as was hoped. The old attitude was very evident—a lack of understanding and interest in the farmer.

Seeking to stimulate interest in dairying, the chamber of commerce invited the farmers of the community to be its guests on a motor car trip to Fort Scott, Kansas, a prosperous dairy center. Seventy-nine farmers and business men went. Some of the best and some of the poorest farms in the county were visited. The men were dinner guests at the Fort Scott chamber of commerce.

Mr. Baghdigian describes it:

"It was an inspiration to make this trip. Everybody got friendly and visited among themselves. The trip brought out the fact that we are all human and all have the same aspirations and aims in life and that one of the best assets in life is friendship and friendly co-operation."

That was the real beginning of the laying of the girders across the gap of misunderstanding between business men and farmers.

Recently the Iola chamber of commerce, the advertising club and the current topics club held a joint banquet. The members had as their guests the business men and the farmers. These farmers were invited individually to attend, not by the organizations but by some business man who knew them. Several business men invited as many as five farmers.

One hundred and sixty-nine farmers sat down at a friendly table with Iola's business men and merchants. The dinner was purely a social, get-acquainted affair, very informal. There was a speaker who discussed dairying as a business proposition. But most of the time was spent in individual discussions at the tables, the merchant and the farmer talking things over, each getting the viewpoint of the other. To many of them it was a revelation—something that made them stop and think.

The next day, under the auspices of the chamber of commerce, a big auction sale of purebred Holstein cattle was held. This sale was said to be the largest in the history of the Holstein-Fresian Association of Kansas in point of attendance.

The Iola chamber of commerce, the advertising club and the Kansas Holstein-Fresian Association guaranteed that no misrepresentation should, under any circumstances, be made about any animal sold at the auction and that every guaranty going with the animal sold should be made good.

Baghdigian realized that he must consider the welfare of the merchants as well as the farmers if he desired their support. He believed this could best be done by proving to the farmers that the merchants were their friends not only in theory but in practice. Every bargain offer, every statement in the advertisements of the merchants participating, is guaranteed by the Iola advertising club and the chamber of commerce.

To get sales-day publicity before the farmers the chamber of commerce is sending out 12,500 monthly bulletins to farm homes in the Iola trade territory. In addition to carrying sales-day publicity and advertisements, these bulletins contain discussions of farm problems of all kinds prepared by experts.

As a means of getting better acquainted with the farmers—putting the floor on the bridge across the gap—Baghdigian and James A. Milham, county agent, are putting on evening programs in various rural communities. The meeting is opened with 20 minutes of community singing. Farm problems and farm bureau work is then discussed by County Agent Milham. This is followed by a short talk by Mr. Baghdigian, contrasting agricultural conditions in the old country with those in the United States. The formal part of the program is followed with a light lunch supplied by the farm women.

Such has been the work of Baghdigian—an Armenian immigrant.

For the Promotion of International Good Will

American University Union in London Looks After Students Seeking European Advantages and a Broader Viewpoint

By GEORGE F. KEARNEY

THERE is in operation in London an institution that has behind it a very practical ideal of internationalizing education as a basis for a new world understanding. Its interest to the educational world of America is unusual, in that it represents a definite step toward a well-marked trend in higher education. This accounts for the ever-increasing number of American college students who are availing themselves of the privileges offered by the American University Union that has its headquarters at 50 Russell Square in the heart of the academic center of London near the British museum.

Educational values in the United States have so shifted within the last ten years that the student no longer stops when he is granted his college degree. The professional man, of course, goes on for his more technical courses, and it has become increasingly true that the man in search of general culture is more anxious for graduate work. The wise educator has always urged the student to take his graduate work in another college, for a change in the viewpoint of his higher education has been considered essential.

The advance in this idea, which is represented by the American University Union, is the definite recommendation that the student take his graduate work, even for general culture, in a foreign university. This ideal represents the finest trend of world thought today when all civilized countries are thinking in international terms. Long has the scholar journeyed to Leipzig and Oxford for his technically scholastic studies, but this desire for a totally different background for graduate education represents a newer phase in American educational life.

Outgrowth of World War

THE American University Union is an outgrowth of the movement that grew up after the signing of the armistice which sent 35,000 American soldiers serving their country to the universities of England and France. It was found to be such a practical institution to promote understanding between American and foreign universities that it was reorganized after the war as a permanent institution with offices in London and Paris.

The London offices are under the direction of Dr. George E. MacLean and there is being worked out in this office a unique phase of international education which is combining definite work in some English institution and a course of travel in that greatest of all institutions—the University of the World. Dr. MacLean not only arranges for places in the crowded universities of England for American students, but he is working out a system of guidance for college students who are anxious to see the world and to watch the wheels of civilization spin around.

Dr. MacLean was formerly the president of the State University of Iowa. He had earned a rest from his labors as a college president but the war, and the demand then for some sort of useful service, impelled him to accept an appointment with the American Army Over-sea Educational Commission. When he was finished with the task of supervising the placing of 2,000 students in English universities he was asked to organize the American University Union on a permanent basis. It is now on such a basis, definitely functioning as a clearing house for American and English college professors and students, and to it is now being added this newer phase of first-hand education in the mechanics of civilization.

First-Hand Factory Experience

THESE are great days for practical studies and there is a very general demand all over the country for the sending of technical students into industrial establishments for first-hand experience. The new contribution of the American University Union, then, is to send the student interested in political science, diplomacy, social science and foreign culture into the workshop of the world for intimate, first-hand experience. It is this function of the union that has become important, and it is for this reason that the General Educational Board and individual colleges in America, together with the British and French governments, have contributed to its support, thereby making it possible to offer its services free to all American students and college professors.

"We are living in a new international era" explained Dr. MacLean when interviewed in his spacious offices in the house on Russell Square, "and I conceive this union to be an answer to the definite demand to prepare university graduates for international leadership by study in foreign universities and travels throughout the world. It is my belief that peace throughout the world will be possible only through the formulation of a basis of mutual understanding that can be brought about only by an intermingling of the young students of the world in a new comradeship.

"The object of the institute is to develop international good will by means of educational agencies. It seeks, therefore, to be a bureau of information and advice for Americans concerning things cultural and educational in all foreign countries and for foreigners concerning things cultural and educational in the United States, and accepts the union officers in France and Great Britain as its representatives in those countries.

"The union undertakes to obtain and disseminate information as to opportunities for graduate study, regulations for degrees, and scholarships and fellowships open to Americans in the universities and other institutions of higher education of France, Great Britain and Italy. The union, by means of a questionnaire, hopes to obtain information with regard to British, French and Italian professors willing to accept temporary teaching posts or to give lectures in the colleges and universities of the United States.

"In short, at this university bureau house, there is a beginning of the realization of the vision of a university international clearing house of information and advice, and a headquarters for visiting scholars and conferences."

The American University Union functions in many interesting ways. Through its offices there is always passing the American college student and the office never seems to fail to take care of his wants. A young graduate student arrives with the object of gathering material for a thesis on a phase of English imperialism. He is referred to the great mines of literature at the London School of Economics. Another student has contracted a severe cold and would like to know a good doctor. He is sent immediately to one of the best specialists in London who charges a moderate price through agreement with the union. In a crowded London Dr. MacLean arranges hotel accommodations ahead of time for the traveling student. He puts at his disposal cards of introduction to prominent men and should any difficulties arise, the American University Union keeps in close touch with the American Embassy to solve all troubles. Students are referred to good London tailors who do not charge tourist prices. A list of good plays to be seen in London is kept, and the office is kept posted as to recitals and art exhibitions. Travelers are advised as to the best traveling routes to take and the best agencies with which to deal on tours. In these hundred and one little ways does this union make for the enlightened and more economical travel of American students in pursuit of this new sort of course in the wheels of civilization.

For the information of many American students thinking of coming to England for this new sort of graduate course, Dr. MacLean has prepared a prospectus of opportunities, but he has further explained in this interview the conditions which the American student must face in coming at this time.

English University Expenses

ENGLISH universities are crowded at the present time. Several generations of college students, owing to the war, are attending the colleges and also, Dr. MacLean explains, there has developed a new sense of the value of collegiate education among the English people which accounts for the greater number of students in all English colleges. In spite of these crowded conditions, and in spite of long waiting lists of English students denied admission to many English colleges, there has been evidenced a special desire on the part of English university authorities to provide in some way for graduate students from America who meet with their requirements. There has been reserved a special number of places for American students and Dr. MacLean states that the places have been rapidly filled by students until there are really very few vacanies now left for the next year in English colleges.

Oxford and Cambridge are especially crowded. All the colleges are full and the accommodations in the towns are said to be very scarce and very costly. The cost of a university training at Oxford and Cambridge might be illustrated by the experience of Rhodes scholars. The original Rhodes scholarship was three hundred pounds (roughly $1,500) but now the Rhodes trust grants an additional fifty pounds bonus and it is the experience of these Rhodes scholars that they can live only with economy over here and can do very little traveling as provided by their grant. Some of them depend on extra work to supplement their incomes which is totally out of the spirit of an Oxford education.

Rooms at Oxford in approved lodgings cost normally about three pounds and five shillings (roughly about $13) a week but they can be secured for three pounds. The British way of itemizing fees for university courses may be called the piece system of payment as contrasted with the American plan of payment in lump sums. The fees at Oxford are doubtless the most expensive of all and Cambridge next. The total of fees in Oxford for the doctor of philosophy degree (in England D.Ph. and in America Ph. D.) is about $240 if three years' study is required; $210 if for two years. The London total of fees for the same degree is $230 (if for three years) and $190 (if for two years). It must be noted that degrees in science cost considerably more on account of charges for materials used in laboratories.

On this basis, one might conservatively put the cost of a year's education at Oxford or Cambridge with an allowance for travel at about $3,000 a year and it runs all the way up to $5,000. It should be emphasized that the type of education offered by Oxford and Cambridge is radically different from that which one gets at, for instance, the University of London with its many branches that stretch out all over the city. Oxford emphasizes the gentlemanly tradition in education and a great deal of its value lies in the communal training that living within the musty old confines of a delightful college gives the young student. This real training of Oxford is totally dissimilar from the training of an American college that does not, in its community life, place so high a premium on the culture of manner. Incidentally, this is one of the best possible trainings that could be offered the ruder American student with his more boisterous traditions that does not make him a true man of the world. A sacrifice of American ideals to the ease and *savoir-faire* of the European is not a bad addition to the education of a true American gentleman and the development of a real sense of culture in American life is not an undesirable object.

World's Great School of Economics

IT SHOULD be pointed out that in a university like the University of London the American student can get a vision of world economics that can be obtained nowhere else in the world. Amid the life of London, the greatest human laboratory in the world, there is a great school for the study of economics and another for the study of world trade, and both are open to Americans. The University of London has a library surpassed by no other university in the world and has facilities for technical studies surpassed by few universities.

In a place like the University of London one finds a more democratic background for study. Frequently the American student does not attempt to enter the social life of Oxford and thus a great deal of the very best that Oxford can offer is not accepted. In London, there is no attempt made to develop a cloister-like social life. All the students are really day students or "out students" and they wander about London and the Continent at their own free will, returning only for their courses in the University of London. It is here that probably the more serious scholastic work is done by the foreign student.

Mention should be made of the provincial or civic universities of the United Kingdom which are even more cosmopolitan than Oxford and Cambridge for they have a greater percentage of foreign students. A university like the University of Aberdeen resembles more distinctly the American university and it is there that the American student feels more at home.

An interesting sidelight on English education can be obtained by a survey of the conditions of higher education in England. It will be noted that there are but 18 accredited universities in the United Kingdom as contrasted with the 600 universities and colleges of the United States, which number could be swelled to nearly 1,000 by the inclusion of those institutions that do not come up to the full attainments of a definite university standard. The total student population in Great Britain is probably not more than 35,000 as contrasted to the hundreds of thousands of American students now in attendance at American colleges.

Quality First Consideration

THIS indicates a great difference in viewpoint of the English people on higher education. They distinctly believe in quality in university training instead of quantity production that is inevitable in a more democratic social life. To the English it has been considered a waste of valuable time to send the average youth to college, and it is only today that this idea is being abandoned with very great reluctance. The residential and tutorial system of English universities, with the expenses entailed in such a procedure, does not lend itself to great numbers as it is very costly. However, this idea is breaking down in view of the wider acceptance of the ideals of higher education for the greater mass of the youth of Great Britain.

English universities are no different at the present time from American institutions in the facing of serious financial problems. The war has hit them much harder than it has affected American colleges. The English Parliament made a grant of one million pounds to the universities even before the signing of the armistice which indicates what great store England sets by for the value of higher education. The Royal Commission to determine the expenditure of this appropriation is now at work at Oxford and Cambridge. In the meantime the University of London is being developed more and more as the great imperial university of England.

Into the center of all this, into the center of a new world, the American student is now invited to enter, with facilities for achieving a new international viewpoint placed at his command.

Massasoit—the Good Indian

By CARL SCHURZ LOWDEN

THERE was a time in our history when the people thought that the only good Indian was a dead Indian. But they had forgotten Massasoit and how the Pilgrims might have endured a miserable fate without his friendship. They had forgotten the story of Bradford, the governor, who recorded that on "a fair warm day toward" in the spring of 1621 the Pilgrims "were interrupted by the savages" and "interrupted again" and soon "there presented himself a savage which caused an alarm."

Boldly as a modern bandit the red man proceeded up the main street of Plymouth. Anticipating trickery of some sort, the Pilgrims prudently intercepted him; whereupon the lone visitor surprised them by saluting in words they readily understood:

"Welcome, Englishmen! I am the envoy of Massasoit, the greatest commander in this land."

Captain Miles Standish probably doubted the latter part of the announcement, but he did not urge upon the savage his own claims to the honor. Instead, he saw the fellow's bow and two arrows, one headed and the other bare; and presently he found occasion to suggest that henceforth all arms should be left about a quarter of a mile outside Plymouth.

This statue of Massasoit, the Indian friend of the Pilgrims, is to be unveiled this summer at Plymouth, Massachusetts. It is the work of Cyrus E. Dallin, famous American sculptor of "The Scout," "The Signal of Peace," "The Indian Hunter," "The Medicine Man" and other Indian types.

Samoset (for that was the Indian's name) wore only a thin leather about his waist. Such stark nudity did not agree with the Pilgrim ideas of modesty; the hosts hastily cast a horseman's cloak about him.

Where had Samoset learned the English language? Where was his tribe and how numerous the warriors thereof? These are only two of the dozens of questions the colonists asked while the savage ate the biscuit, butter, cheese, pudding, and piece of duck, meanwhile washing all down with the "strong water" cunningly substituted for the beer he had requested.

The visitor talked as he ate. Four years before his people had been almost wiped out by a plague; and that accounted for the fact that the Pilgrims had found the near-by land unoccupied. As for his acquirement of the English language, he declared he had been with the English fishermen along the Maine Coast and had picked up the few words he knew.

The Pilgrims and Samoset talked far into the afternoon. They wanted to be rid of him, but he had apparently made up his mind to stay. Still suspicious, they lodged him that night at Steven Hopkin's house and, as Bradford wrote, "watched him." The next morning they gave him a knife, a bracelet and a ring; and he departed after promising to return soon with some of his friends and "such beaver skins as they had to truck with us."

Samoset and five men came Sunday, after casting their bows and arrows aside at some distance from Plymouth. The colonists offered food, and the red men responded with songs and dances. They had three or four skins. The Englishmen refused to bother with the small number, also disliking to barter on the Sabbath; so they asked the savages to bring more and they would then "truck for all."

Because of the significance of the day the white men dismissed their visitors as soon as they could. They left the skins, even against the protests of the Pilgrims, and the five left Samoset who was "sick or feigned himself so." On Wednesday morning they gave their first acquaintance a hat, a pair of stockings and shoes, a shirt, and a piece of cloth to tie about his waist. Perhaps the English-speaking savage coyly suspected he would be enriched if he remained.

Would Samoset bring his chief, Massasoit, the next time he came? They would have a powwow and smoke the peace pipe and be friends forever. Samoset liked the idea. He would guide Massasoit there.

After a few days Massasoit and his warriors arrived at Plymouth. The colonists were not impressed with the dignity of the great sagamore, for they described him as "painted of a sad red" with head and face so oiled that he "looked greasily." This attitude was further advanced by the marked relish that Massasoit and his men displayed for drum music; they had never seen a drum.

But the Indians truly wanted to maintain their friendship with the white men and sought an alliance.

The Pilgrims knew that the Wampanoags had little military strength, but they also knew that as scouts and conveyors of information the tribe would be a valuable help. Consequently in the momentous spring of 1621 the first treaty in our history was signed at Plymouth. William Bradford thus recorded the agreement which contained six provisions:

1. That neither he nor any of his should injurie or doe hurte to any of their peopl.
2. That if any of his did any hurte to any of theirs, he should send the offender, that they might punish him.
3. That if anything were taken away from any of theirs, he should cause it to be restored; and they should doe the like to his.
4. If any did unjustly warr against him, they would aide him; if any did warr against them, he should aide them.
5. He should send to his neighbors confederats to certifie them of this, that they might not wrong him, but might be likewise comprised in the conditions of the peace.
6. That when their men came to them, they should leave their bows and arrows behind them.

Did the colonists "put one over" the Wampanoags in the final article? The red men must come unarmed when they desired to enter Plymouth; but the white men were not placed under any similar provision when paying a visit to Massasoit at the tribal camp.

Note that the second item required punishment for offenders among the savages, also that nothing was said on the subject of transgressions by the whites, with the exception of the stipulation on theft as set forth in the third paragraph. Furthermore, the opening statement was one which bound the natives while it left civilization, as represented by the Pilgrims, utterly free. Did our Puritan ancestors consider themselves angels on earth and incapable of doing wrong?

On the whole it cannot be denied that the treaty strongly favored the English. A summing up reveals that the Indians were bound by the entire six points whereas the wily white men were obligated by only two.

The aborigines, ever ready to aid their new friends, in a short time taught the "pale faces" how to "set their corne, when to take fish, and how to procure other commodities."

In 1623, approximately two years after the signing of the treaty, the death of Massasoit was reported to two Pilgrims. Like Mark Twain's, however, it was greatly exaggerated. These men, Edward Winslow and John Hampden, who had been dispatched by Governor Bradford to the bedside of the old chief, decided to continue their journey with their Indian guide, Hobbamock. When they arrived, they found a number of wailing squaws and medicine men trying to drive the devil of sickness away. Six or eight of the dusky women were chafing the limbs of the sick man who was so nearly dead that he could not see.

"Art thou Winslow?" the tribal head feebly asked on being told that the men were before him.

"Yes, Massasoit."

"Oh, Winslow," he mourned, "I shall never see you again."

But the Englishmen refused to give up hope. Winslow asked Hobbamock to act as interpreter. Then he told the savage who, in turn, told his master:

"The governor was grieved to learn that you are sick. Being unable to come himself, he sent us with some comfortable things for your relief."

Winslow gave his red-faced friend a "confection of many comfortable conserves," dosed it to him on the point of his knife; but the sick man clenched his teeth and the other could scarcely remove the knife therefrom.

"When it was dissolved in his mouth," Winslow afterward wrote of the incident, "he swallowed the juice of it; whereat those that were about him much rejoiced, saying he had not swallowed anything in two days before."

Winslow gathered strawberry leaves, pulled up a sassafras root, and boiled them together. "I strained it through my handkerchief," he said of the brew, "and gave him at least a pint, which he drank and liked very well."

Within half an hour the "physician" had wrought a noticeable improvement in the patient's condition.

The old sachem later revealed a conspiracy against the colonists, and the Pilgrims thwarted the plot.

In his "New England Memorial" Nathaniel Morton pictured the chief as "a very lusty man in his last years, an able body, grave of countenance, and spare of speech." Certainly he was humane and honest, and certainly he never violated his word.

The Psychology of Profanity

By EDWARD BOCK

WHY do men swear? Swearing is bad form and from the standpoint of common sense an utterly futile use of vocal energy. Religious teaching forbids swearing as blasphemy and public opinion brands the user of profanity as common, vulgar and indecent. And still men swear. Profanity seems to be as prevalent among the races of mankind as breathing and eating. The oldest literature extant familiarizes us with the oaths and objurgations of the ancients and travelers among primitive tribes confirm the assertion that swearing is a universal human habit. The universality of profanity suggests that it subserves some common and fundamental need which the rigid rules of propriety and social disapproval are unable to prevent from finding satisfaction. In his book on "The Psychology of Relaxation," Professor G. T. W. Patrick makes clear what this need is and how profanity satisfies it.

Disregarding for the moment the ethics of the situation and considering only the psychology involved, Professor Patrick observes that swearing offers a physiologically harmless exercise to emotions which might otherwise be destructive. Long before language was evolved, the animals through cries, snarls and growls gave expression to their feelings and communicated with their fellows. One of the most primitive forms of vocalization was the roar of anger which was of use in combat in terrifying the enemy. It was of a kind with the showing of teeth, the bristling of the hair and other defensive measures. When a man is in a frenzy of anger and action is impossible, his only relief from the tension is the modern form of the snarl and growl namely ejaculation and vituperation. Profanity is caused by "a situation in which there is a high degree of emotion usually of the aggressive type accompanied by a feeling of helplessness." Action being impossible, the strong feeling of anger or disapproval finds its outlet in withering language. Professor Patrick says that if a man did not swear, he would do something worse. As it is, he gets satisfaction without hurting the other fellow. The principle is similar to the relief obtained by women from a good cry. Swearing is therefore a purgative. The loudest swearer, like the barking dog, usually is the least to be feared. Swearing is a safety valve in that it prevents a destructive explosion.

Why cannot provocation and annoyance be relieved through more innocuous language? Professor Patrick answers this by showing that as the animal acquired the kind of roar which was most efficacious in terrifying its adversary, so man uses expletives which will produce the greatest amount of shock in the opponent. If one cannot do the enemy physical harm one can at least have the satisfaction of consigning him and his progeny to eternal perdition. If one cannot hurt him, the gods can be invoked to do the job. The verbal weapons chosen in this mock combat will be those which are most telling in their effects. The names of sacred persons, places and objects best meet the requirements.
